Under the terms of this license, you may copy and redistribute the work, provided the work is appropriately cited, as indicated below. In any use of this work, there should be no suggestion that WHO endorses any specific organization, products or services. The use of the WHO logo is not permitted. This license does not allow you to produce adaptations of the work (including translations) without permission from WHO.

Any mediation relating to disputes arising under the license shall be conducted in accordance with the mediation rules of the World Intellectual Property Organization.

This PDF version of ICD-11 was generated to support the user preference for viewing ICD-11 in a portable format. The definitive version of ICD-11 is available from <https://icd.who.int/browse11/l-m/en>.

**Suggested citation.** International Classification of Diseases, Eleventh Revision (ICD-11). Geneva: World Health Organization; 2022. License: [CC BY-ND 3.0 IGO](https://creativecommons.org/licenses/by-nd/3.0/igo/).

**Third-party materials.** If you wish to reuse material from this work that is attributed to a third party, such as tables, figures or images, it is your responsibility to determine whether permission is needed for that reuse and to obtain permission from the copyright holder. The risk of claims resulting from infringement of any third-party-owned component in the work rests solely with the user.

**General disclaimers.** The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of WHO concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement.

The mention of specific companies or of certain manufacturers' products does not imply that they are endorsed or recommended by WHO in preference to others of a similar nature that are not mentioned. Errors and omissions excepted, the names of proprietary products are distinguished by initial capital letters.

All reasonable precautions have been taken by WHO to verify the information contained in this publication. However, the published material is being distributed without warranty of any kind, either expressed or implied. The responsibility for the interpretation and use of the material lies with the reader. In no event shall WHO be liable for damages arising from its use.

## Correct use of ICD-11

Please refer to the reference guide for the correct use of ICD-11 (<https://iccdn.who.int/icd11referenceguide/en/html/index.html> ).

To prevent the dilution of ICD's purpose to provide a definitive standard for identifying health information, ICD-11 may not be used for the purpose of developing or promoting a different standard.

The use of ICD-11 in software products is subject to the following license: <https://icd.who.int/en/docs/ICD11-license.pdf>. Under the terms of this license, users may not:

- reproduce ICD-11 in part or whole and distribute it under a different name or without attribution;
- reproduce and distribute ICD-11 in part or whole without the ICD-11 codes;
- reproduce ICD-11 in part or whole without the ICD-11 URIs (not applicable for print publications).

Mappings or crosslinks between other classifications and terminologies and ICD-11 and/or translations are not covered by the ICD-11 license and are subject to a separate written agreement from WHO.

Adding data fields to ICD-11 concepts is permitted, provided such additions are clearly identified as additions that do not originate from WHO.

Suggestions for changes to ICD-11 should be submitted as a proposal to the ICD-11 maintenance platform (<https://icd.who.int/en>).

## TABLE OF CONTENTS

CHAPTER 01 .....	44
Certain infectious or parasitic diseases .....	44
Gastroenteritis or colitis of infectious origin (1A00-1A40.Z) .....	45
Bacterial intestinal infections (1A00-1A0Z) .....	45
Bacterial foodborne intoxications (1A10-1A1Z) .....	47
Viral intestinal infections (1A20-1A2Z) .....	48
Protozoal intestinal infections (1A30-1A3Z) .....	49
Predominantly sexually transmitted infections (1A60-1A9Z).....	51
Syphilis (1A60-1A6Z) .....	51
Gonococcal infection (1A70-1A7Z) .....	54
Sexually transmissible infections due to chlamydia (1A80-1A8Z) .....	55
Mycobacterial diseases (1B10-1B2Z).....	58
Tuberculosis (1B10-1B1Z) .....	58
Certain staphylococcal or streptococcal diseases (1B40-1B5Z).....	63
Acute rheumatic fever (1B40-1B42) .....	63
Pyogenic bacterial infections of the skin or subcutaneous tissues (1B70-1B7Z).....	66
Certain zoonotic bacterial diseases (1B90-1B9Z) .....	70
Other bacterial diseases (1C10-1C4Z).....	73
Other diseases due to chlamydiae (1C20-1C2Z).....	83
Rickettsioses (1C30-1C3Z).....	84
Human immunodeficiency virus disease (1C60-1C62.Z) .....	87
Viral infections of the central nervous system (1C80-1C8Z) .....	92
Non-viral and unspecified infections of the central nervous system (1D00-1D0Z).....	95
Dengue (1D20-1D2Z) .....	101
Certain arthropod-borne viral fevers (1D40-1D4Z) .....	101
Certain zoonotic viral diseases (1D60-1D6Z) .....	104
Certain other viral diseases (1D80-1E1Z).....	108
Viral infection of unspecified site (1D90-1D9Z).....	111
Influenza (1E30-1E32) .....	112
Viral hepatitis (1E50-1E5Z).....	113
Viral infections characterised by skin or mucous membrane lesions (1E70-1F0Z) .....	116
Infections due to poxvirus (1E70-1E7Z) .....	116
Human papillomavirus infection of skin or mucous membrane (1E80-1E8Z) .....	118

Varicella zoster virus infections (1E90-1E91.Z) .....	119
Mycoses (1F20-1F2Z) .....	124
Parasitic diseases (1F40-1G2Z) .....	137
Malaria (1F40-1F4Z) .....	137
Nonintestinal protozoal diseases (1F50-1F5Z).....	139
Helminthiases (1F60-1F9Z) .....	144
Diseases due to nematodes (1F60-1F6Z).....	144
Diseases due to cestodes (1F70-1F7Z).....	150
Diseases due to trematodes (1F80-1F8Z) .....	153
Infestations by ectoparasites (1G00-1G0Z) .....	156
Sepsis (1G40-1G41).....	159
Sequelae of infectious diseases (1G80-1G8Y) .....	161
CHAPTER 02 .....	162
Neoplasms.....	162
Neoplasms of brain or central nervous system (2A00-2A0Z) .....	162
Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z) .....	165
Myeloproliferative neoplasms (2A20-2A2Z).....	165
Myelodysplastic syndromes (2A30-2A3Z).....	167
Myelodysplastic and myeloproliferative neoplasms (2A40-2A4Z) .....	168
Myeloid and lymphoid neoplasms with eosinophilia and abnormalities of PDGFRA, PDGFRB or FGFR1 (2A50-2A5Z) .....	169
Precursor lymphoid neoplasms (2A70-2A7Z) .....	172
Mature B-cell neoplasms (2A80-2A8Z) .....	173
Mature T-cell or NK-cell neoplasms (2A90-2B2Z).....	180
Mature T-cell or NK-cell lymphomas and lymphoproliferative disorders, primary cutaneous specified types (2B00-2B0Z) .....	182
Malignant neoplasms, except primary neoplasms of lymphoid, haematopoietic, central nervous system or related tissues (2B50-2E2Z) .....	187
Malignant neoplasms, stated or presumed to be primary, of specified sites, except of lymphoid, haematopoietic, central nervous system or related tissues (2B50-2D3Z) .....	187
Malignant mesenchymal neoplasms (2B50-2B5Z) .....	187
Malignant neoplasms of lip, oral cavity or pharynx (2B60-2B6Y).....	192
Malignant neoplasms of digestive organs (2B70-2C1Z) .....	198
Malignant neoplasms of intestine (2B80-2C0Z) .....	200
Malignant neoplasms of large intestine (2B90-2B9Y) .....	201

Malignant neoplasms of middle ear, respiratory or intrathoracic organs (2C20-2C2Z).....	208
Malignant neoplasms of skin (2C30-2C3Z) .....	212
Malignant neoplasms of peripheral nerves or autonomic nervous system (2C40-2C4Z) .....	215
Malignant neoplasms of retroperitoneum, peritoneum or omentum (2C50-2C5Z) .....	216
Malignant neoplasms of breast (2C60-2C6Z) .....	217
Malignant neoplasms of female genital organs (2C70-2C7Z).....	219
Malignant neoplasms of male genital organs (2C80-2C8Z) .....	224
Malignant neoplasms of urinary tract (2C90-2C9Z).....	226
Malignant neoplasms of eye or ocular adnexa (2D00-2D0Z) .....	228
Malignant neoplasms of endocrine glands (2D10-2D1Z) .....	231
Malignant neoplasms of ill-defined or unspecified primary sites (2D40-2D4Z) .....	233
Malignant neoplasm metastases (2D50-2E2Z) .....	234
Malignant neoplasm metastasis in lymph nodes (2D60-2D6Z) .....	234
Malignant neoplasm metastasis in thoracic or respiratory organs (2D70-2D7Z).....	235
Malignant neoplasm metastasis in digestive system (2D80-2D8Z) .....	235
Malignant neoplasm metastasis in retroperitoneum or peritoneum (2D90-2D91).....	236
Malignant neoplasm metastasis in other sites (2E00-2E0Y).....	236
In situ neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues (2E60-2E6Z).....	237
Benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues (2E80-2F5Z) .....	242
Benign mesenchymal neoplasms (2E80-2E8Z) .....	242
Benign non-mesenchymal neoplasms (2E90-2F3Z) .....	247
Benign neoplasm of respiratory or intrathoracic organs (2F00-2F0Z) .....	249
Benign cutaneous neoplasms (2F20-2F2Z) .....	250
Neoplasms of uncertain behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues (2F70-2F7Z) .....	256
Neoplasms of unknown behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues (2F90-2F9Z) .....	258
CHAPTER 03 .....	259
Diseases of the blood or blood-forming organs .....	259
Anaemias or other erythrocyte disorders (3A00-3A9Z) .....	260
Nutritional or metabolic anaemias (3A00-3A03.Y).....	260
Haemolytic anaemias (3A10-3A4Z).....	264
Congenital haemolytic anaemia (3A10-3A1Y) .....	264

Acquired haemolytic anaemia (3A20-3A2Z) .....	265
Pure red cell aplasia (3A60-3A6Z).....	271
Polycythaemia (3A80-3A8Z).....	275
Coagulation defects, purpura or other haemorrhagic or related conditions (3B10-3B6Z) .....	277
Coagulation defects (3B10-3B4Z) .....	277
Congenital or constitutional haemorrhagic condition (3B10-3B1Z).....	277
Haemorrhagic diseases due to acquired coagulation factor defects (3B20-3B2Y) .....	279
Fibrinolytic defects (3B50-3B51).....	280
Diseases of spleen (3B80-3B8Z).....	286
CHAPTER 04 .....	290
Diseases of the immune system .....	290
Primary immunodeficiencies (4A00-4A0Z) .....	290
Nonorgan specific systemic autoimmune disorders (4A40-4A4Z) .....	294
Autoinflammatory disorders (4A60-4A6Z) .....	303
Allergic or hypersensitivity conditions (4A80-4A8Z).....	305
Immune system disorders involving white cell lineages (4B00-4B0Z).....	312
Certain disorders involving the immune system (4B20-4B2Y) .....	314
CHAPTER 05 .....	317
Endocrine, nutritional or metabolic diseases .....	317
Endocrine diseases (5A00-5B3Z).....	317
Disorders of the thyroid gland or thyroid hormones system (5A00-5A0Z) .....	317
Diabetes mellitus (5A10-5A2Y) .....	322
Acute complications of diabetes mellitus (5A20-5A2Y).....	324
Other disorders of glucose regulation or pancreatic internal secretion (5A40-5A4Z) .....	326
Disorders of the parathyroids or parathyroid hormone system (5A50-5A5Z) .....	327
Disorders of the pituitary hormone system (5A60-5A6Z) .....	329
Disorders of the adrenal glands or adrenal hormone system (5A70-5A7Z).....	332
Disorders of the gonadal hormone system (5A80-5A8Z) .....	335
Certain disorders of puberty (5A90-5A9Z).....	337
Polyglandular dysfunction (5B00-5B0Z).....	338
Endocrine disorders, not elsewhere classified (5B10-5B1Y) .....	338
Nutritional disorders (5B50-5C3Z).....	339
Undernutrition (5B50-5B7Z) .....	339
Sequelae of malnutrition or certain specified nutritional deficiencies (5B60-5B6Z) .....	350

Overweight, obesity or specific nutrient excesses (5B80-5C1Z).....	351
Overweight or obesity (5B80-5B81.Z).....	351
Certain specified nutrient excesses (5B90-5B9Z) .....	353
Metabolic disorders (5C50-5D2Z).....	356
Inborn errors of metabolism (5C50-5C5Z).....	356
Disorders of metabolite absorption or transport (5C60-5C6Z) .....	373
Disorders of fluid, electrolyte or acid-base balance (5C70-5C7Z) .....	379
Disorders of lipoprotein metabolism or certain specified lipidaemias (5C80-5C8Z).....	381
Other metabolic disorders (5D00-5D0Y) .....	384
Postprocedural endocrine or metabolic disorders (5D40-5D46) .....	386
CHAPTER 06 .....	388
Mental, behavioural or neurodevelopmental disorders .....	388
Neurodevelopmental disorders (6A00-6A0Z).....	389
Schizophrenia or other primary psychotic disorders (6A20-6A2Z).....	400
Catatonia (6A40-6A4Z).....	409
Mood disorders (6A60-6A8Z).....	411
Bipolar or related disorders (6A60-6A6Z) .....	411
Depressive disorders (6A70-6A7Z).....	420
Anxiety or fear-related disorders (6B00-6B0Z).....	429
Obsessive-compulsive or related disorders (6B20-6B2Z) .....	432
Disorders specifically associated with stress (6B40-6B4Z) .....	437
Dissociative disorders (6B60-6B6Z) .....	440
Feeding or eating disorders (6B80-6B8Z) .....	446
Elimination disorders (6C00-6C0Z) .....	450
Disorders of bodily distress or bodily experience (6C20-6C2Z).....	452
Disorders due to substance use or addictive behaviours (6C40-6C5Z) .....	454
Disorders due to substance use (6C40-6C4Z) .....	454
Disorders due to addictive behaviours (6C50-6C5Z) .....	555
Impulse control disorders (6C70-6C7Z) .....	558
Disruptive behaviour or dissociative disorders (6C90-6C9Z).....	560
Personality disorders and related traits (6D10-6D11.5).....	563
Paraphilic disorders (6D30-6D3Z) .....	566
Factitious disorders (6D50-6D5Z) .....	568
Neurocognitive disorders (6D70-6E0Z).....	569

Dementia (6D80-6D8Z) .....	574
Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium (6E20-6E2Z) .....	584
Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere (6E60-6E6Z) .....	587
CHAPTER 07 .....	595
Sleep-wake disorders .....	595
Insomnia disorders (7A00-7A0Z) .....	596
Hypersomnolence disorders (7A20-7A2Z) .....	597
Sleep-related breathing disorders (7A40-7A4Z) .....	600
Circadian rhythm sleep-wake disorders (7A60-7A6Z) .....	606
Sleep-related movement disorders (7A80-7A8Z) .....	608
Parasomnia disorders (7B00-7B0Z) .....	610
CHAPTER 08 .....	614
Diseases of the nervous system .....	614
Movement disorders (8A00-8A0Z) .....	615
Disorders with neurocognitive impairment as a major feature (8A20-8A2Z) .....	626
Multiple sclerosis or other white matter disorders (8A40-8A4Z) .....	627
Epilepsy or seizures (8A60-8A6Z) .....	634
Headache disorders (8A80-8A8Z) .....	642
Cerebrovascular diseases (8B00-8B2Z) .....	645
Intracranial haemorrhage (8B00-8B0Z) .....	645
Cerebral ischaemia (8B10-8B1Z) .....	647
Spinal cord disorders excluding trauma (8B40-8B4Z) .....	656
Motor neuron diseases or related disorders (8B60-8B6Z) .....	658
Disorders of nerve root, plexus or peripheral nerves (8B80-8C4Z) .....	661
Disorders of cranial nerves (8B80-8B8Z) .....	661
Nerve root or plexus disorders (8B90-8B9Z) .....	663
Polyneuropathy (8C00-8C0Z) .....	664
Mononeuropathy (8C10-8C1Z) .....	666
Hereditary neuropathy (8C20-8C2Z) .....	668
Diseases of neuromuscular junction or muscle (8C60-8D0Z) .....	670
Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z) .....	670
Primary disorders of muscles (8C70-8C7Z) .....	671

Secondary myopathies (8C80-8C8Z).....	678
Cerebral palsy (8D20-8D2Z).....	680
Nutritional or toxic disorders of the nervous system (8D40-8D4Z).....	682
Disorders of cerebrospinal fluid pressure or flow (8D60-8D6Z).....	685
Disorders of autonomic nervous system (8D80-8D8Z).....	688
Human prion diseases (8E00-8E0Z) .....	691
Disorders of consciousness (8E20-8E2Z) .....	692
Other disorders of the nervous system (8E40-8E4Y).....	693
Postprocedural disorders of the nervous system (8E60-8E66) .....	698
CHAPTER 09 .....	700
Diseases of the visual system.....	700
Disorders of the ocular adnexa or orbit (9A00-9A4Z).....	701
Disorders of eyelid or peri-ocular area (9A00-9A0Z).....	701
Disorders of lacrimal apparatus (9A10-9A1Z).....	707
Disorders of orbit (9A20-9A2Z).....	708
Disorders of the eyeball - anterior segment (9A60-9B3Z).....	711
Disorders of conjunctiva (9A60-9A6Z) .....	711
Disorders of the cornea (9A70-9A7Z) .....	714
Disorders of the anterior chamber (9A80-9A8Z) .....	717
Disorders of the anterior uvea (9A90-9A9Z).....	717
Functional disorders of the pupil (9B00-9B0Z) .....	719
Disorders of lens (9B10-9B1Z) .....	720
Disorders of the eyeball - posterior segment (9B50-9C0Z) .....	722
Disorders of sclera (9B50-9B5Z).....	722
Disorders of the choroid (9B60-9B6Z) .....	723
Disorders of the retina (9B70-9B7Z) .....	724
Disorders of the vitreous body (9B80-9B8Z) .....	731
Disorders of the eyeball affecting both anterior and posterior segments (9C20-9C2Z) .....	731
Disorders of the visual pathways or centres (9C40-9C4Z).....	732
Glaucoma or glaucoma suspect (9C60-9C6Z) .....	734
Strabismus or ocular motility disorders (9C80-9C8Z).....	739
Disorders of refraction or accommodation (9D00-9D0Z).....	744
Postprocedural disorders of eye or ocular adnexa (9D20-9D25) .....	745
Impairment of visual functions (9D41-9D7Z).....	746

Subjective visual experiences (9D50-9D5Z).....	748
Vision impairment (9D90-9D9Z) .....	749
CHAPTER 10 .....	752
Diseases of the ear or mastoid process .....	752
Diseases of external ear (AA00-AA6Z).....	753
Infectious diseases of external ear (AA00-AA0Z).....	753
Otitis externa (AA10-AA3Z).....	754
Noninfectious inflammation of external ear (AA10-AA1Z).....	754
Noninflammatory disorders of the external ear (AA40-AA4Z) .....	755
Diseases of middle ear or mastoid (AA80-AB1Z).....	756
Otitis media (AA80-AB0Z) .....	756
Nonsuppurative otitis media (AA80-AA8Z).....	756
Suppurative otitis media (AA90-AA9Z) .....	756
Diseases of inner ear (AB30-AB3Z) .....	760
Disorders with hearing impairment (AB50-AB5Z) .....	764
Disorders of ear, not elsewhere classified (AB70-AB7Y) .....	765
Postprocedural disorders of ear or mastoid process (AB90-AB93).....	766
CHAPTER 11 .....	767
Diseases of the circulatory system.....	767
Hypertensive diseases (BA00-BA04.Z) .....	768
Hypotension (BA20-BA2Z) .....	770
Ischaemic heart diseases (BA40-BA6Z).....	770
Acute ischaemic heart disease (BA40-BA4Z) .....	770
Chronic ischaemic heart disease (BA50-BA5Z) .....	772
Diseases of coronary artery (BA81-BA8Z).....	775
Pulmonary heart disease or diseases of pulmonary circulation (BB00-BB0Z).....	776
Pericarditis (BB20-BB2Z) .....	779
Acute or subacute endocarditis (BB40-BB4Z).....	780
Heart valve diseases (BB60-BC0Z) .....	781
Mitral valve disease (BB60-BB6Z) .....	781
Aortic valve disease (BB70-BB7Z) .....	783
Tricuspid valve disease (BB80-BB8Z) .....	784
Pulmonary valve disease (BB90-BB9Z) .....	785
Diseases of the myocardium or cardiac chambers (BC40-BC4Z).....	789

Cardiac arrhythmia (BC60-BC9Z) .....	794
Ventricular rhythm disturbance (BC70-BC7Z) .....	797
Supraventricular rhythm disturbance (BC80-BC8Z).....	798
Heart failure (BD10-BD1Z) .....	802
Diseases of arteries or arterioles (BD30-BD5Z) .....	803
Chronic arterial occlusive disease (BD40-BD4Z) .....	804
Diseases of veins (BD70-BD7Z) .....	810
Disorders of lymphatic vessels or lymph nodes (BD90-BD9Z).....	815
Postprocedural disorders of circulatory system (BE10-BE1F.1) .....	818
CHAPTER 12 .....	823
Diseases of the respiratory system .....	823
Upper respiratory tract disorders (CA00-CA0Z).....	824
Certain lower respiratory tract diseases (CA20-CA2Z) .....	834
Lung infections (CA40-CA4Z) .....	841
Lung diseases due to external agents (CA60-CA8Z).....	848
Pneumonitis (CA70-CA7Z).....	850
Respiratory diseases principally affecting the lung interstitium (CB00-CB0Z) .....	854
Pleural, diaphragm or mediastinal disorders (CB20-CB2Z).....	860
Postprocedural disorders of the respiratory system (CB60-CB64).....	866
CHAPTER 13 .....	867
Diseases of the digestive system .....	867
Diseases or disorders of orofacial complex (DA00-DA0Z) .....	868
Diseases of oesophagus (DA20-DA2Z).....	885
Diseases of the stomach or the duodenum (DA40-DA7Z).....	893
Diseases of stomach (DA40-DA4Z) .....	893
Diseases of duodenum (DA50-DA5Z).....	898
Ulcer of stomach or duodenum (DA60-DA63.Z).....	902
Diseases of small intestine (DA90-DA9Z).....	906
Diseases of appendix (DB10-DB1Z).....	914
Diseases of large intestine (DB30-DB3Z) .....	916
Diseases of anal canal (DB50-DB7Z) .....	923
Acquired anatomical alterations of the anal canal (DB50-DB5Z) .....	923
Haemorrhoids or perianal venous conditions (DB60-DB6Z).....	925
Diseases of liver (DB90-DB9Z).....	928

Diseases of gallbladder or biliary tract (DC10-DC1Z).....	940
Diseases of pancreas (DC30-DC3Z) .....	943
Diseases of peritoneum (DC50-DC5Z) .....	946
Diverticular disease of intestine (DC70-DD1Z) .....	948
Diverticular disease of small intestine (DC70-DC72.Z) .....	948
Diverticular disease of large intestine (DC80-DC82.Z).....	949
Diverticular disease of intestine of overlapping sites (DC90-DC90) .....	951
Diverticular disease of unspecified part of intestine (DD00-DD02.Z).....	951
Ischaemic vascular disorders of intestine (DD30-DD3Z).....	952
Hernias (DD50-DD5Z).....	953
Inflammatory bowel diseases (DD70-DD7Z).....	955
Functional gastrointestinal disorders (DD90-DD9Z) .....	957
Postprocedural disorders of digestive system (DE10-DE13) .....	962
<b>CHAPTER 14 .....</b>	<b>964</b>
Diseases of the skin.....	964
Certain skin disorders attributable to infection or infestation (EA00-EA6Y).....	965
Certain skin disorders attributable to viral infection (EA00-EA3Z) .....	965
Viral exanthems (EA00-EAOY) .....	965
Certain dermatoses with suspected viral aetiology (EA10-EA12) .....	966
Dermatoses from distant or systemic viral infection (EA20-EA20) .....	966
Certain skin disorders attributable to bacterial infection (EA40-EA5Z).....	967
Predominantly tropical or subtropical bacterial infections affecting skin (EA40-EA40).....	967
Inflammatory dermatoses (EA80-EB7Y) .....	970
Dermatitis and eczema (EA80-EA8Z) .....	970
Papulosquamous dermatoses (EA90-EA95) .....	976
Urticaria, angioedema and other urticarial disorders (EB00-EB0Y) .....	980
Inflammatory erythemas and other reactive inflammatory dermatoses (EB10-EB31).....	982
Neutrophilic dermatoses (EB20-EB2Y).....	984
Immunobullous diseases of the skin (EB40-EB4Y) .....	985
Cutaneous lupus erythematosus (EB50-EB5Z).....	988
Scarring or sclerosing inflammatory dermatoses (EB60-EB61.Z) .....	989
Metabolic and nutritional disorders affecting the skin (EB90-EB9Y) .....	990
Genetic and developmental disorders affecting the skin (EC10-EC7Y) .....	994
Genetic syndromes affecting the skin (EC10-EC1Y).....	994

Genetically-determined epidermolysis bullosa (EC30-EC3Z).....	998
Genetic disorders affecting dermal collagen, elastin or other matrix proteins (EC40-EC4Y).....	999
Specified developmental anomalies affecting the skin (EC50-EC5Y) .....	1000
Sensory and psychological disorders affecting the skin (EC90-ED3Y) .....	1000
Disturbances of cutaneous sensation (EC90-EC9Y) .....	1000
Mental conditions affecting the skin (ED00-ED2Y).....	1003
Self-inflicted skin disorders (ED00-ED0Y) .....	1003
Neurological conditions affecting the skin (ED30-ED3Y) .....	1004
Skin disorders involving specific cutaneous structures (ED50-EG02).....	1005
Disorders of the epidermis and epidermal appendages (ED50-EE21).....	1005
Disorders of epidermal keratinisation (ED50-ED5Y).....	1005
Disorders of skin colour (ED60-ED6Y) .....	1007
Disorders of hair (ED70-ED7Y) .....	1010
Disorders of the hair follicle (ED80-ED9Y) .....	1014
Acne and related disorders (ED80-ED81.Y) .....	1014
Disorders of eccrine sweat glands or sweating (EE00-EEOY) .....	1018
Disorders of the nail or perionychium (EE10-EE1Z).....	1019
Disorders of epidermal integrity (EE20-EE21) .....	1022
Disorders of the dermis and subcutis (EE40-EFOY).....	1023
Disorders of cutaneous connective tissue (EE40-EE7Y).....	1023
Poikiloderma (EE50-EE50).....	1024
Fibromatoses and keloids (EE60-EE6Y).....	1025
Histiocytic-granulomatous disorders of the skin (EE80-EE8Y).....	1026
Benign dermal lymphocytic or lymphoplasmacytic infiltrations or proliferations (EE90-EE91) .....	1027
Disorders of subcutaneous fat (EF00-EFOY).....	1027
Disorders of cutaneous blood and lymphatic vessels (EF20-EG02).....	1029
Malformations involving cutaneous blood vessels (EF20-EF2Z).....	1029
Purpura or bruising (EF30-EF3Z) .....	1030
Dermatoses attributable to hyperviscosity or microvascular occlusion (EF50-EF5Y) .....	1031
Dermatoses resulting from vascular insufficiency (EF60-EF9Y).....	1031
Dermatoses due to venous disease (EF70-EF7Z) .....	1032
Functional vascular disorders of the skin (EG00-EG02) .....	1032
Skin disorders involving certain specific body regions (EG30-EG9Z).....	1033

Skin disorders involving the head and neck (EG30-EG4Z) .....	1033
Disorders of the external ear involving the skin (EG40-EG4Z).....	1034
Inflammatory disorders of the external ear (EG40-EG4Z).....	1034
Skin disorders involving the genital and perianal regions (EG60-EG7Y).....	1034
Dermatoses of the anus, perianal area or perineum (EG60-EG63.Z) .....	1034
Skin disorders associated with pregnancy, the neonatal period and infancy (EH10-EH40.Z).....	1036
Skin disorders specific to the perinatal or neonatal period (EH10-EH3Y) .....	1036
Neonatal skin infection (EH10-EH1Z).....	1036
Adverse cutaneous reactions to medication (EH60-EH7Z).....	1038
Drug eruptions (EH60-EH6Z).....	1038
Skin disorders provoked by external factors (EH90-EK5Y) .....	1043
Dermatoses provoked or exacerbated by exposure to cold (EJ0Y-EJ0Y).....	1046
Dermatoses provoked by heat or electricity (EJ10-EJ1Y) .....	1046
Dermatoses provoked by light or UV radiation (EJ20-EJ6Y) .....	1047
Chronic effects of ultraviolet radiation on the skin (EJ20-EJ2Y) .....	1047
Acute effects of ultraviolet radiation on normal skin (EJ40-EJ4Z).....	1048
Dermatoses due to ionizing radiation (EJ71-EJ7Z).....	1049
Phototoxic reactions to skin contact with photoactive agents (EK20-EK2Z) .....	1054
Benign proliferations, neoplasms and cysts of the skin (EK70-EK71.Z).....	1055
Disorders of the skin of uncertain or unpredictable malignant potential (EK90-EK92) .....	1057
Cutaneous markers of internal disorders (EL10-EL3Y) .....	1059
Cutaneous markers of internal malignancy (EL10-EL1Y) .....	1059
Postprocedural disorders of the skin (EL50-EL80) .....	1059
Adverse cutaneous effects of therapeutic ionizing irradiation (EL60-EL63).....	1060
Complications of cutaneous cosmetic procedures (EL73-EL73.6).....	1061
CHAPTER 15 .....	1063
Diseases of the musculoskeletal system or connective tissue .....	1063
Arthropathies (FA00-FA5Z) .....	1064
Osteoarthritis (FA00-FA0Z) .....	1064
Infection related arthropathies (FA10-FA1Z).....	1065
Inflammatory arthropathies (FA20-FA2Z).....	1067
Certain specified joint disorders or deformities of limbs (FA30-FA3Z).....	1072
Conditions associated with the spine (FA70-FB1Z).....	1077
Structural disorders of spine (FA70-FA7Z) .....	1077

Degenerative condition of spine (FA80-FA8Z).....	1079
Inflammation of spine (FA90-FA9Z).....	1081
Spondylopathies (FB00-FB0Z).....	1082
Soft tissue disorders (FB30-FB6Z).....	1083
Disorders of muscles (FB30-FB3Z) .....	1083
Disorders of synovium or tendon (FB40-FB4Z).....	1085
Miscellaneous specified soft tissue disorders (FB50-FB56.6).....	1087
Osteopathies or chondropathies (FB80-FB8Z).....	1091
CHAPTER 16 .....	1098
Diseases of the genitourinary system.....	1098
Diseases of the female genital system (GA00-GA6Z) .....	1099
Inflammatory disorders of the female genital tract (GA00-GA0Z) .....	1099
Noninflammatory disorders of female genital tract (GA12-GA1Z).....	1105
Abnormal uterine or vaginal bleeding (GA20-GA2Z) .....	1111
Dermatoses of female genitalia (GA40-GA4Y).....	1121
Diseases of the male genital system (GA80-GB0Z).....	1122
Dermatoses of male genitalia (GA80-GA81.Y).....	1122
Diseases of prostate (GA90-GA91.Z) .....	1123
Disorders of breast (GB20-GB2Z).....	1130
Diseases of the urinary system (GB40-GC2Z) .....	1132
Glomerular diseases (GB40-GB4Z).....	1132
Renal tubulo-interstitial diseases (GB50-GB5Z).....	1134
Kidney failure (GB60-GB6Z) .....	1137
Urolithiasis (GB70-GB7Z) .....	1139
Cystic or dysplastic kidney disease (GB80-GB8Z) .....	1141
Certain specified diseases of urinary system (GC00-GC0Y) .....	1146
Other conditions of the genitourinary system (GC40-GC51.Z).....	1152
Female pelvic floor dysfunction (GC40-GC4Z).....	1152
Postprocedural disorders of genitourinary system (GC70-GC7B) .....	1158
CHAPTER 17 .....	1160
Conditions related to sexual health .....	1160
Sexual dysfunctions (HA00-HA0Z) .....	1160
Sexual pain disorders (HA20-HA2Z) .....	1166
Gender incongruence (HA60-HA6Z) .....	1168

CHAPTER 18 .....	1170
Pregnancy, childbirth or the puerperium .....	1170
Abortive outcome of pregnancy (JA00-JA0Z) .....	1170
Oedema, proteinuria, or hypertensive disorders in pregnancy, childbirth, or the puerperium (JA20-JA2Z).....	1176
Obstetric haemorrhage (JA40-JA4Z) .....	1179
Certain specified maternal disorders predominantly related to pregnancy (JA60-JA6Z).....	1182
Maternal care related to the fetus, amniotic cavity or possible delivery problems (JA80-JA8Z).1187	
Complications of labour or delivery (JB00-JB0Z) .....	1193
Delivery (JB20-JB2Z).....	1202
Complications predominantly related to the puerperium (JB40-JB4Z) .....	1204
Certain obstetric conditions, not elsewhere classified (JB60-JB6Z) .....	1208
CHAPTER 19 .....	1213
Certain conditions originating in the perinatal period .....	1213
Fetus or newborn affected by maternal factors or by complications of pregnancy, labour or delivery (KA00-KA0Z) .....	1214
Disorders of newborn related to length of gestation or fetal growth (KA20-KA2Z) .....	1224
Birth injury (KA40-KA4Z) .....	1230
Infections of the fetus or newborn (KA60-KA6Z).....	1236
Haemorrhagic or haematological disorders of fetus or newborn (KA80-KA8Z).....	1240
Neurological disorders specific to the perinatal or neonatal period (KB00-KB0Z).....	1247
Respiratory disorders specific to the perinatal or neonatal period (KB20-KB2Z).....	1249
Cardiovascular disorders present in the perinatal or neonatal period (KB40-KB4Z) .....	1255
Transitory endocrine or metabolic disorders specific to fetus or newborn (KB60-KB6Z) .....	1256
Digestive system disorders of fetus or newborn (KB80-KB8Z) .....	1260
Genitourinary system disorders specific to the perinatal or neonatal period (KC00-KC0Z) .....	1264
Disorders involving the integument of fetus or newborn (KC20-KC9Z) .....	1264
Skin disorders associated with prematurity (KC30-KC3Y) .....	1266
Iatrogenic injuries involving the skin of the neonate (KC50-KC7Y) .....	1267
Postnatal iatrogenic skin injury (KC50-KC5Z).....	1267
Disturbances of temperature regulation of newborn (KD10-KD1Z).....	1268
Certain disorders originating in the perinatal period (KD30-KD3Y).....	1268
CHAPTER 20 .....	1274
Developmental anomalies .....	1274

Structural developmental anomalies primarily affecting one body system (LA00-LD0Z) .....	1274
Structural developmental anomalies of the nervous system (LA00-LA0Z) .....	1274
Structural developmental anomalies of the eye, eyelid or lacrimal apparatus (LA10-LA1Z) ...	1281
Structural developmental anomalies of the ear (LA20-LA2Z) .....	1286
Structural developmental anomalies of the face, mouth or teeth (LA30-LA5Z) .....	1288
Clefts of lip, alveolus or palate (LA40-LA4Z) .....	1291
Structural developmental anomalies of the neck (LA60-LA6Z) .....	1293
Structural developmental anomalies of the respiratory system (LA70-LA7Z).....	1293
Structural developmental anomalies of the circulatory system (LA80-LA9Z) .....	1297
Structural developmental anomaly of heart or great vessels (LA80-LA8Z) .....	1297
Structural developmental anomalies of the diaphragm, abdominal wall or umbilical cord (LB00-LB0Z) .....	1319
Structural developmental anomalies of the digestive tract (LB10-LB1Z).....	1320
Structural developmental anomalies of the liver, biliary tract, pancreas or spleen (LB20-LB2Z) .....	1326
Structural developmental anomalies of the urinary system (LB30-LB3Z) .....	1328
Structural developmental anomalies of the female genital system (LB40-LB4Z).....	1332
Structural developmental anomalies of the male genital system (LB50-LB5Z) .....	1337
Structural developmental anomalies of the breast (LB60-LB6Z).....	1340
Structural developmental anomalies of the skeleton (LB70-LB9Z) .....	1340
Congenital deformities of fingers or toes (LB80-LB81.Z).....	1347
Structural developmental anomalies of the skin (LC00-LC7Z).....	1353
Developmental hamartomata of the epidermis and epidermal appendages (LC00-LC0Y) ..	1353
Developmental anomalies of skin pigmentation (LC10-LC1Y).....	1354
Hamartomata derived from dermal connective tissue (LC20-LC2Y) .....	1354
Developmental defects of hair or nails (LC30-LC31).....	1354
Developmental anomalies of cutaneous vasculature (LC50-LC5Z).....	1354
Congenital anomalies of skin development (LC60-LC60) .....	1355
Structural developmental anomalies of the adrenal glands (LC80-LC8Z) .....	1355
Multiple developmental anomalies or syndromes (LD20-LD2Z) .....	1356
Chromosomal anomalies, excluding gene mutations (LD40-LD7Z) .....	1380
Sex chromosome anomalies (LD50-LD5Z) .....	1390
CHAPTER 21 .....	1396
Symptoms, signs or clinical findings, not elsewhere classified.....	1396

Symptoms of blood, blood-forming organs, or the immune system (MA00-MA0Y) .....	1397
Symptoms, signs or clinical findings of blood, blood-forming organs, or the immune system (MA10-MA3Y) .....	1397
Clinical findings in blood, blood-forming organs, or the immune system (MA10-MA1Y).....	1397
Symptoms, signs or clinical findings of endocrine, nutritional or metabolic diseases (MA50-MA6Y)	
.....	1402
Results of function studies of the endocrine, nutritional or metabolic diseases (MA50-MA51)	
.....	1402
Symptoms, signs or clinical findings of speech or voice (MA80-MB0Y) .....	1403
Symptoms or signs involving speech or voice (MA80-MA8Y).....	1403
Mental or behavioural symptoms, signs or clinical findings (MB20-MB2Y).....	1405
Symptoms, signs or clinical findings of the nervous system (MB40-MB9Y).....	1423
Symptoms or signs involving the nervous system (MB40-MB6Y) .....	1423
Paralytic symptoms (MB50-MB5Z) .....	1429
Clinical findings in the nervous system (MB70-MB7Y).....	1432
Symptoms, signs or clinical findings of the visual system (MC10-MC2Y).....	1433
Symptoms or signs involving the visual system (MC10-MC1Y) .....	1433
Symptoms, signs or clinical findings of ear or mastoid process (MC40-MC6Y).....	1434
Symptoms or signs involving the ear or mastoid process (MC40-MC4Y).....	1434
Symptoms, signs or clinical findings of the circulatory system (MC80-MC9Y).....	1435
Symptoms or signs involving the circulatory system (MC80-MC8Y) .....	1435
Symptoms, signs or clinical findings of the respiratory system (MD10-MD6Y) .....	1438
Symptoms or signs involving the respiratory system (MD10-MD3Y) .....	1438
Haemorrhage from respiratory passages (MD20-MD2Z) .....	1440
Clinical findings in the respiratory system (MD40-MD4Y).....	1443
Symptoms, signs or clinical findings of the digestive system or abdomen (MD80-ME4Y).....	1444
Symptoms or signs involving the digestive system or abdomen (MD80-ME1Y) .....	1444
Symptoms related to the upper gastrointestinal tract (MD90-MD9Y).....	1446
Symptoms related to the lower gastrointestinal tract or abdomen (ME00-ME0Y) .....	1447
Clinical findings in the digestive system (ME20-ME2Y) .....	1450
Symptoms, signs or clinical findings involving the skin (ME60-ME6Y) .....	1454
Symptoms or signs involving the skin (ME60-ME6Y).....	1454
Symptoms, signs or clinical findings of the musculoskeletal system (ME80-MF1Y) .....	1460
Symptoms or signs of the musculoskeletal system (ME80-ME8Y) .....	1460
Clinical findings in the musculoskeletal system (ME90-ME9Y).....	1465

Symptoms, signs or clinical findings of the genitourinary system (MF30-MG0Y) .....	1467
Symptoms, signs or clinical findings involving the female genital system (MF30-MF3Y) .....	1467
Symptoms, signs or clinical findings involving the male genital system (MF40-MF4Y).....	1468
Symptoms, signs or clinical findings involving the urinary system (MF50-MF5Y).....	1469
Clinical findings in specimens from female genital organs (MF60-MF6Z).....	1473
Clinical findings in specimens from male genital organs (MF70-MF7Z) .....	1473
Clinical findings in specimens from the urinary system (MF80-MF8Z).....	1474
Clinical findings on examination of urine, without diagnosis (MF90-MF9Y) .....	1475
General symptoms, signs or clinical findings (MG20-MG9Y).....	1478
General symptoms (MG20-MG4Y) .....	1478
Pain (MG30-MG3Z) .....	1482
Finding of microorganism resistant to antimicrobial drugs (MG50-MG5Z) .....	1500
Clinical findings in specimens from other specified organs, systems and tissues (MG60-MG6Y)	
.....	1515
Abnormal results, not elsewhere classified (MG70-MG7Z).....	1515
III-defined and unknown causes of mortality (MH10-MH15).....	1516
CHAPTER 22 .....	1518
Injury, poisoning or certain other consequences of external causes .....	1518
Injuries to the head (NA00-NA0Z) .....	1519
Injuries to the neck (NA20-NA6Z) .....	1534
Injury of nerves or spinal cord at neck level (NA30-NA4Z).....	1537
Injury of spinal cord at neck level (NA30-NA3Z).....	1537
Injury of nerves at neck level (NA40-NA4Z).....	1537
Injuries to the thorax (NA80-NB3Z) .....	1540
Injury of nerves or spinal cord at thorax level (NA90-NB2Z).....	1543
Injury of spinal cord at thorax level (NA90-NA9Z) .....	1543
Injury of nerves at thorax level (NB00-NB0Y) .....	1543
Injuries to the abdomen, lower back, lumbar spine or pelvis (NB50-NB9Z) .....	1549
Injury of nerves or lumbar spinal cord at abdomen, lower back or pelvis level (NB60-NB7Z).1551	
Injury of spinal cord at abdomen, lower back or pelvis level (NB60-NB6Z) .....	1551
Injury of nerves at abdomen, lower back or pelvis level (NB70-NB7Z) .....	1552
Injuries to the shoulder or upper arm (NC10-NC1Z) .....	1562
Injuries to the elbow or forearm (NC30-NC3Z).....	1567
Injuries to the wrist or hand (NC50-NC5Z) .....	1572

Injuries to the hip or thigh (NC70-NC7Z) .....	1581
Injuries to the knee or lower leg (NC90-NC9Z).....	1587
Injuries to the ankle or foot (ND10-ND1Z).....	1594
Injuries involving multiple body regions (ND30-ND37) .....	1601
Injuries to unspecified part of trunk, limb or body region (ND50-ND5Z).....	1602
Effects of foreign body entering through natural orifice (ND70-ND7Z) .....	1604
Burns (ND90-NE2Z) .....	1607
Burns of external body surface, specified by site (ND90-ND9Z).....	1607
Burns of eye or internal organs (NE00-NE0Z).....	1610
Burns of multiple or unspecified body regions (NE10-NE11) .....	1611
Frostbite (NE40-NE4Z) .....	1611
Harmful effects of substances (NE60-NE6Z).....	1612
Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z) ....	1613
Other or unspecified effects of external causes (NF00-NF0Z).....	1618
CHAPTER 23 .....	1623
External causes of morbidity or mortality .....	1623
Unintentional causes (PA00-PB6Z) .....	1623
Unintentional transport injury event (PA00-PA5Z) .....	1623
Unintentional land transport road traffic injury event (PA00-PA0Z).....	1624
Unintentional land transport off-road nontraffic injury event (PA10-PA1Z).....	1625
Unintentional land transport injury event unknown whether road traffic or off-road nontraffic (PA20-PA2Z).....	1626
Unintentional railway transport injury event (PA30-PA3Z).....	1627
Unintentional water transport injury event (PA40-PA4Z) .....	1627
Unintentional fall (PA60-PA6Z) .....	1628
Unintentional contact with person, animal or plant (PA70-PA7Z) .....	1628
Unintentional exposure to object, not elsewhere classified (PA80-PA8Z).....	1629
Unintentional immersion, submersion or falling into water (PA90-PA9Z).....	1629
Unintentional threat to breathing (PB00-PB0Z) .....	1630
Unintentional exposure to thermal mechanism (PB10-PB1Z).....	1630
Unintentional exposure to or harmful effects of substances (PB20-PB36) .....	1631
Unintentional exposure to or harmful effects of drugs, medicaments or biological substances (PB20-PB29) .....	1631
Unintentional exposure to or harmful effects of substances chiefly nonmedicinal as to source (PB30-PB36) .....	1632

Unintentional exposure to other mechanism (PB50-PB5B) .....	1632
Intentional self-harm (PB80-PD3Z) .....	1633
Intentional self-harm by transport injury event (PB80-PC2Z) .....	1633
Intentional self-harm by water transport injury event (PB90-PB9Z).....	1633
Intentional self-harm by air or space transport injury event (PC00-PC0Z).....	1634
Intentional self-harm by fall or jump (PC30-PC3Z) .....	1634
Intentional self-harm by contact with person, animal or plant (PC40-PC4Z).....	1634
Intentional self-harm by exposure to object, not elsewhere classified (PC50-PC5Z).....	1635
Intentional self-harm by immersion, submersion or falling into water (PC60-PC6Z).....	1635
Intentional self-harm by threat to breathing (PC70-PC7Z).....	1636
Intentional self-harm by exposure to thermal mechanism (PC80-PC8Z) .....	1636
Intentional self-harm by exposure to or harmful effects of substances (PC90-PD05) .....	1637
Intentional self-harm by exposure to or harmful effects of drugs, medicaments or biological substances (PC90-PC99).....	1637
Intentional self-harm by exposure to or harmful effects of substances chiefly nonmedicinal as to source (PD00-PD05).....	1637
Intentional self-harm by exposure to other mechanism (PD20-PD29) .....	1638
Assault (PD50-PF2Z).....	1638
Assault by transport events (PD50-PD9Z).....	1638
Assault by water transport injury event (PD60-PD6Z).....	1639
Assault by air or space transport injury event (PD70-PD7Z) .....	1639
Assault by causing a fall or jump (PE00-PE0Z) .....	1639
Assault by contact with person, animal or plant (PE10-PE1Z).....	1640
Assault by exposure to object not elsewhere classified (PE20-PE4Z) .....	1640
Assault by being cut or pierced by sharp object (PE30-PE3Z) .....	1640
Assault by immersion, submersion or falling into water (PE50-PE5Z) .....	1641
Assault by threat to breathing (PE60-PE6Z).....	1641
Assault by exposure to thermal mechanism (PE70-PE7Z) .....	1641
Assault by exposure to or harmful effects of substances (PE80-PE95) .....	1642
Assault by exposure to or harmful effects of drugs, medicaments or biological substances (PE80-PE8Z).....	1642
Assault by exposure to or harmful effects of substances chiefly nonmedicinal as to source (PE90-PE95).....	1643
Assault by exposure to other mechanism (PF10-PF1B).....	1643
Undetermined intent (PF40-PH8Z) .....	1644

Transport injury event of undetermined intent (PF40-PG4Z) .....	1644
Land transport road traffic injury event of undetermined intent (PF40-PF4Z) .....	1644
Land transport off-road nontraffic injury event of undetermined intent (PF50-PF5Z) .....	1645
Land transport injury event of undetermined intent, unknown whether road traffic or off-road nontraffic (PF60-PF6Z) .....	1646
Railway transport injury event of undetermined intent (PF70-PF7Z) .....	1647
Water transport injury event of undetermined intent (PF80-PG1Z) .....	1647
Water transport injury event of undetermined intent with water vessel damaged, disabled or destroyed (PF80-PF8Z) .....	1647
Water transport injury event of undetermined intent with water vessel not damaged, disabled or destroyed (PF90-PF9Z) .....	1648
Air or space transport injury event of undetermined intent (PG20-PG2Z) .....	1648
Fall or jump with undetermined intent (PG50-PG5Z).....	1648
Contact with person, animal or plant with undetermined intent (PG60-PG6Z).....	1648
Contact with object, not elsewhere classified with undetermined intent (PG70-PH0Z) .....	1649
Struck by projectile from firearm of undetermined intent (PG70-PG7Z).....	1649
Cut or pierced by sharp object of undetermined intent (PG90-PG9Z).....	1649
Immersion, submersion or falling into water with undetermined intent (PH10-PH1Z) .....	1650
Threat to breathing with undetermined intent (PH20-PH2Z) .....	1650
Exposure to thermal mechanism with undetermined intent (PH30-PH3Z).....	1651
Exposure to or harmful effects of substances, undetermined intent (PH40-PH56).....	1651
Exposure to or harmful effects of undetermined intent of drugs, medicaments or biological substances (PH40-PH49).....	1651
Exposure to or harmful effects of undetermined intent of substances chiefly nonmedicinal as to source (PH50-PH56).....	1652
Exposure to other mechanism with undetermined intent (PH70-PH7B) .....	1652
Exposure to extreme forces of nature (PJ00-PJ0Z).....	1653
Maltreatment (PJ20-PJ2Z) .....	1654
Legal intervention (PJ40-PJ4Z) .....	1654
Armed conflict (PJ60-PK6Z).....	1655
Explosion of marine weapons during armed conflict (PJ60-PJ6Z) .....	1655
Attack on or destruction of aircraft during armed conflict (PJ70-PJ7Z) .....	1655
Other explosions or fragments during armed conflict (PJ80-PJ8Z) .....	1655
Fires, conflagrations or hot substances during armed conflict (PJ90-PJ9Z) .....	1656

Firearm discharge or other forms of conventional warfare during armed conflict (PK00-PK0Z) .....	1656
Use of nuclear weapons during armed conflict (PK10-PK1Z) .....	1656
Use of biological weapons during armed conflict (PK20-PK2Z).....	1656
Chemical weapons or other forms of unconventional warfare during armed conflict (PK30-PK3Z) .....	1656
Injury event occurring after cessation of armed conflict (PK40-PK4Z).....	1657
Causes of healthcare related harm or injury (PK80-PL14.Z).....	1657
Surgical or other medical procedures associated with injury or harm in diagnostic or therapeutic use (PK80-PK8Z).....	1657
Surgical or other medical devices, implants or grafts associated with injury or harm in therapeutic use (PK90-PK9C.4) .....	1673
Substances associated with injury or harm in therapeutic use (PL00-PL0Z) .....	1693
CHAPTER 24 .....	1703
Factors influencing health status or contact with health services .....	1703
Reasons for contact with the health services (QA00-QD3Z) .....	1703
Contact with health services for purposes of examination or investigation (QA00-QA0Z) ....	1703
Contact with health services for counselling (QA10-QA1Z).....	1710
Contact with health services for reasons associated with reproduction (QA20-QA4Z) .....	1712
Contact with health services for procreative management (QA30-QA3Z).....	1712
Health care related circumstances influencing the episode of care without injury or harm (QA50-QB0Z) .....	1721
Circumstances associated with a surgical or other medical procedure influencing the episode of care, without injury or harm (QA50-QA5Z) .....	1721
Circumstances associated with a surgical or other medical device influencing the episode of care without injury or harm (QA60-QA6Z) .....	1722
Circumstances associated with exposure to a drug, medicament or biological substance influencing the episode of care without injury or harm (QA70-QA7Z) .....	1723
Circumstances associated with other aspects of care influencing the episode of care without injury or harm (QA80-QA8Z).....	1725
Factors related to medical facilities and other health care (QB10-QB1Z).....	1727
Donors of organs or tissues (QB20-QB2Z) .....	1728
Fitting, adjustment or management of devices (QB30-QB3Z) .....	1728
Dependence on enabling machines or devices (QB40-QB4Z) .....	1730
Presence of device, implants or grafts (QB50-QB5Z) .....	1731
Surgical or postsurgical states (QB60-QB6Z) .....	1732

Convalescence (QB70-QB7Z) .....	1734
Contact with health services for specific surgical interventions (QB80-QB8Z) .....	1734
Contact with health services for nonsurgical interventions not involving devices (QB90-QB9Z) .....	1735
Contact with health services related to immunizations or certain other prophylactic measures (QC00-QC0Z) .....	1738
Interventions not carried out (QC10-QC1Z) .....	1740
Contact with health services associated with the health of others (QC20-QC2Z) .....	1740
Personal or family history or late effect of prior health problems (QC40-QC8Z).....	1741
Personal history of health problems (QC40-QC4Z) .....	1741
Family history of health problems (QC60-QC6Z) .....	1743
Risk factors associated with infectious or certain other conditions (QC90-QD2Z) .....	1744
Carrier of infectious disease agent (QD00-QD0Z).....	1745
Concern about body appearance (QD30-QD3Z).....	1746
Factors influencing health status (QD50-QF2Z).....	1746
Problems associated with finances (QD50-QD5Z).....	1746
Problems associated with drinking water or nutrition (QD60-QD6Z) .....	1746
Problems associated with the environment (QD70-QD7Z) .....	1746
Problems associated with employment or unemployment (QD80-QD8Z).....	1747
Problems associated with education (QD90-QD9Z) .....	1749
Problems associated with social or cultural environment (QE00-QE0Z).....	1749
Problems associated with health behaviours (QE10-QE2Z) .....	1750
Hazardous substance use (QE10-QE1Z).....	1750
Problems associated with social insurance or welfare (QE30-QE3Z) .....	1755
Problems associated with the justice system (QE40-QE4Z) .....	1756
Problems associated with relationships (QE50-QE5Z).....	1756
Problems associated with absence, loss or death of others (QE60-QE6Z).....	1758
Problems associated with harmful or traumatic events (QE80-QE8Z) .....	1759
Problems associated with upbringing (QE90-QE9Z) .....	1760
Acquired absence of body structure (QF00-QF0Z) .....	1761
Difficulty or need for assistance with activities (QF20-QF2Z).....	1762
CHAPTER 25 .....	1764
Codes for special purposes .....	1764
International provisional assignment of new diseases of uncertain aetiology and emergency use (RA00-RA09).....	1764

National provisional assignment of new diseases of uncertain aetiology (RA20-RA26) .....	1765
CHAPTER 26 .....	1767
Supplementary Chapter Traditional Medicine Conditions .....	1767
CHAPTER V .....	1790
Supplementary section for functioning assessment.....	1790
WHODAS 2.0 36-item version.....	1790
Cognition [WHODAS] .....	1791
Mobility [WHODAS] .....	1791
Self-care [WHODAS].....	1792
Getting along [WHODAS] .....	1792
Life activities [WHODAS].....	1793
Participation and impact of health problems [WHODAS].....	1794
Brief Model Disability Survey.....	1794
Mental functions [BMDS].....	1795
Sensory functions and pain [BMDS].....	1795
Generic functioning domains.....	1795
Mental functions.....	1795
Sensory functions and pain.....	1797
Voice and speech functions .....	1798
Functions of the cardiovascular, haematological, immunological and respiratory systems....	1798
Functions of the digestive, metabolic and endocrine systems.....	1798
Genitourinary and reproductive functions .....	1799
Neuromusculoskeletal and movement-related functions .....	1799
Functions of the skin and related structures .....	1800
Learning and applying knowledge .....	1800
General tasks and demands.....	1800
Communication.....	1801
Mobility .....	1801
Self-care .....	1802
Domestic life .....	1804
Interpersonal interactions and relationships.....	1805
Major life areas .....	1805
Community, social and civic life.....	1806
CHAPTER X .....	1807

Extension Codes .....	1807
Severity Scale Value .....	1808
Generic Severity Scale Value.....	1808
Mild Moderate Severe Scale Value.....	1808
Clinical Staging Scale Value .....	1808
Grading Scale Value .....	1809
Phase Scale Value.....	1809
Problem Scale Value .....	1809
Disease Specific Severity Scale Value.....	1810
Tumour spread simplified Scale Value.....	1810
Tumour spread staging Scale Value .....	1810
Histological Grading Scale Value.....	1810
NYHA Functional Classification: Class I-IV.....	1811
Chronic Obstructive Lung Disease Criteria: GOLD 1-4 .....	1811
Peripheral arterial disease (PAD) Severity Classification by Fontaine .....	1811
Endometriosis Severity Scale Value .....	1811
Vocal Cord Paralysis Severity Scale Value.....	1812
Sepsis Severity Scale Value .....	1812
Peripheral arterial disease (PAD) Severity Classification by Rutherford .....	1812
Pain Severity Scale Value .....	1813
Pain intensity.....	1813
Pain-related distress .....	1813
Pain-related interference.....	1814
Presence of psychosocial factors Scale Value.....	1814
Adult Nutritional Status Scale Value .....	1814
Coronary atherosclerosis Severity Scale Value .....	1815
Anaphylaxis Severity Scale Value .....	1815
Temporality .....	1815
Course of the Condition .....	1815
Pattern, Activity, or Clinical Status.....	1815
Intermittent-Persistent Scale Value.....	1815
Course .....	1816
Acute-Subacute-Chronic Scale Value.....	1816
Onset.....	1816

Time in Life .....	1816
Duration of pregnancy .....	1818
Aetiology .....	1818
Causality .....	1818
Occupational relevance .....	1818
Infectious Agents .....	1819
Other Pathogens .....	1854
Topology Scale Value .....	1855
Relational .....	1855
Distribution .....	1855
Laterality .....	1856
Regional.....	1856
Anatomy and topography .....	1856
Functional anatomy .....	1856
Haematopoietic system .....	1856
Immune system.....	1857
Lymphoid organs.....	1857
Endocrine system.....	1862
Nervous system.....	1863
Nerve.....	1879
Number of Nerves.....	1884
Visual system .....	1884
Auditory system .....	1886
Circulatory system .....	1888
Lymphatic system .....	1912
Respiratory system.....	1915
Digestive system .....	1919
Integumentary system .....	1927
Musculoskeletal system.....	1928
Bones.....	1928
Joints and ligaments.....	1941
Number of joints .....	1950
Number of Ligaments.....	1950
Cartilage .....	1951

Muscles .....	1951
Tendons.....	1959
Genitourinary system.....	1966
Urinary system .....	1966
Reproductive system.....	1968
Surface topography.....	1971
Partonomic view .....	1986
Walls in the Body .....	1986
Body Tissues.....	1987
Body Cavities.....	1988
Histopathology.....	1989
Acinar cell neoplasms .....	1989
Acinar cell neoplasms, benign.....	1989
Acinar cell neoplasms, malignant .....	1990
Acinar cell neoplasms, uncertain whether benign or malignant .....	1990
Adenomas and adenocarcinomas.....	1990
Adenomas, benign .....	1990
Adenocarcinomas in situ.....	1994
Adenocarcinomas, malignant .....	1995
Adenomas and adenocarcinomas, uncertain whether benign or malignant .....	2003
Adnexal and skin appendage neoplasms.....	2004
Adnexal and skin appendage neoplasms, benign.....	2004
Adnexal and skin appendage neoplasms, in situ .....	2005
Adnexal and skin appendage neoplasms, malignant.....	2005
Adnexal and skin appendage neoplasms, uncertain whether benign or malignant .....	2006
Basal cell neoplasms .....	2006
Basal cell neoplasms, benign .....	2006
Basal cell neoplasms, malignant .....	2006
Basal cell neoplasms, uncertain whether benign or malignant .....	2007
Blood vessel tumours.....	2008
Blood vessel tumours, benign.....	2008
Blood vessel tumours, malignant.....	2009
Blood vessel tumours, uncertain whether benign or malignant .....	2009
Complex epithelial neoplasms .....	2010

Complex epithelial neoplasms, benign .....	2010
Complex epithelial neoplasms, malignant.....	2010
Complex mixed and stromal neoplasms.....	2010
Complex mixed and stromal neoplasms, benign .....	2010
Complex mixed and stromal neoplasms, malignant.....	2011
Complex mixed and stromal neoplasms, uncertain whether benign or malignant .....	2013
Cystic, mucinous and serous neoplasms.....	2013
Cystic, mucinous and serous neoplasms, benign.....	2013
Cystic, mucinous and serous neoplasms, in situ.....	2014
Cystic, mucinous and serous neoplasms, malignant .....	2015
Cystic, mucinous and serous neoplasms, uncertain whether benign or malignant .....	2016
Ductal and lobular neoplasms .....	2016
Ductal and lobular neoplasms, benign.....	2016
Ductal and lobular neoplasms, in situ.....	2017
Ductal and lobular neoplasms, malignant .....	2018
Epithelial neoplasms, NOS .....	2020
Epithelial neoplasms, benign .....	2020
Epithelial neoplasms, in situ .....	2020
Epithelial neoplasms, malignant .....	2020
Epithelial neoplasms, uncertain whether benign or malignant.....	2022
Fibroepithelial neoplasms.....	2022
Fibroepithelial neoplasms, benign.....	2022
Fibroepithelial neoplasms, malignant.....	2023
Fibroepithelial neoplasms, uncertain whether benign or malignant .....	2023
Fibromatous neoplasms.....	2023
Fibromatous neoplasms, benign.....	2023
Fibromatous neoplasms, malignant.....	2025
Fibromatous neoplasms, uncertain whether benign or malignant .....	2026
Germ cell neoplasms.....	2027
Germ cell neoplasms, benign.....	2027
Germ cell neoplasms, in situ .....	2027
Germ cell neoplasms, malignant.....	2027
Germ cell neoplasms, uncertain whether benign or malignant .....	2028
Giant cell tumours.....	2029

Giant cell tumours, benign.....	2029
Giant cell tumours, malignant.....	2029
Giant cell tumours, uncertain whether benign or malignant.....	2029
Gliomas .....	2029
Gliomas, benign .....	2029
Gliomas, malignant .....	2029
Gliomas, uncertain whether benign or malignant .....	2033
Granular cell tumours and alveolar soft part sarcomas .....	2033
Granular cell tumours and alveolar soft part sarcomas, benign .....	2033
Granular cell tumours and alveolar soft part sarcomas, malignant .....	2034
Lipomatous neoplasms .....	2034
Lipomatous neoplasms, benign .....	2034
Lipomatous neoplasms, malignant .....	2034
Lipomatous neoplasms, uncertain whether benign or malignant.....	2035
Lymphatic vessel tumours .....	2035
Lymphatic vessel tumours, benign .....	2035
Lymphatic vessel tumours, malignant .....	2036
Lymphatic vessel tumours, uncertain whether benign or malignant.....	2036
Meningiomas .....	2036
Meningiomas, benign .....	2036
Meningiomas, malignant .....	2037
Meningiomas, uncertain whether benign or malignant.....	2037
Mesonephromas .....	2037
Mesonephromas, benign .....	2037
Mesonephromas, malignant.....	2037
Mesonephromas, uncertain whether benign or malignant .....	2037
Mesothelial neoplasms .....	2038
Mesothelial neoplasms, benign .....	2038
Mesothelial neoplasms, malignant .....	2038
Mesothelial neoplasms, uncertain whether benign or malignant.....	2038
Miscellaneous bone tumours.....	2038
Miscellaneous bone tumours, benign.....	2038
Miscellaneous bone tumours, malignant .....	2039
Miscellaneous tumours.....	2039

Miscellaneous tumours, benign.....	2039
Miscellaneous tumours, malignant.....	2039
Miscellaneous tumours, uncertain whether benign or malignant .....	2040
Mucoepidermoid neoplasms .....	2040
Mucoepidermoid neoplasms, malignant.....	2040
Mucoepidermoid neoplasms, uncertain whether benign or malignant.....	2040
Myomatous neoplasms.....	2040
Myomatous neoplasms, benign.....	2040
Myomatous neoplasms, malignant.....	2041
Myomatous neoplasms, uncertain whether benign or malignant .....	2042
Myxomatous neoplasms.....	2042
Myxomatous neoplasms, benign .....	2042
Myxomatous neoplasms, malignant.....	2042
Nerve sheath tumours .....	2043
Nerve sheath tumours, benign .....	2043
Nerve sheath tumours, malignant .....	2044
Nerve sheath tumours, uncertain whether benign or malignant.....	2044
Neuroepitheliomatous neoplasms.....	2044
Neuroepitheliomatous neoplasms, benign.....	2044
Neuroepitheliomatous neoplasms, malignant .....	2045
Neuroepitheliomatous neoplasms, uncertain whether benign or malignant .....	2046
Nevi and melanomas .....	2046
Nevi and melanomas, benign.....	2046
Nevi and melanomas, in situ.....	2048
Nevi and melanomas, malignant .....	2048
Nevi and melanomas, uncertain whether benign or malignant .....	2049
Odontogenic tumours .....	2049
Odontogenic tumours, benign.....	2049
Odontogenic tumours, malignant.....	2050
Odontogenic tumours, uncertain whether benign or malignant .....	2051
Osseous and chondromatous neoplasms .....	2051
Osseous and chondromatous neoplasms, benign .....	2051
Osseous and chondromatous neoplasms, malignant .....	2052
Osseous and chondromatous neoplasms, uncertain whether benign or malignant.....	2053

Paragangliomas and glomus tumours.....	2053
Paragangliomas and glomus tumours, benign.....	2053
Paragangliomas and glomus tumours, malignant .....	2053
Paragangliomas and glomus tumours, uncertain whether benign or malignant .....	2054
Soft tissue tumours and sarcomas, NOS.....	2054
Soft tissue tumours and sarcomas, NOS, benign .....	2054
Soft tissue tumours and sarcomas, NOS, malignant.....	2055
Soft tissue tumours and sarcomas, NOS, uncertain whether benign or malignant .....	2055
Specialized gonadal neoplasms .....	2055
Specialized gonadal neoplasms, benign.....	2055
Specialized gonadal neoplasms, malignant .....	2056
Specialized gonadal neoplasms, uncertain whether benign or malignant .....	2056
Squamous cell neoplasms.....	2058
Squamous cell neoplasms, benign .....	2058
Squamous cell neoplasms, in situ .....	2058
Squamous cell neoplasms, malignant.....	2059
Synovial-like neoplasms .....	2061
Synovial-like neoplasms, benign .....	2061
Synovial-like neoplasms, malignant .....	2061
Thymic epithelial neoplasms.....	2061
Thymic epithelial neoplasms, benign.....	2061
Thymic epithelial neoplasms, malignant .....	2061
Thymic epithelial neoplasms, uncertain whether benign or malignant .....	2062
Transitional cell papillomas and carcinomas .....	2062
Transitional cell papillomas and carcinomas, benign .....	2062
Transitional cell papillomas and carcinomas, in situ .....	2063
Transitional cell papillomas and carcinomas, malignant .....	2063
Transitional cell papillomas and carcinomas, uncertain whether benign or malignant.....	2063
Trophoblastic neoplasms .....	2064
Trophoblastic neoplasms, benign .....	2064
Trophoblastic neoplasms, malignant.....	2064
Trophoblastic neoplasms, uncertain whether benign or malignant.....	2064
Myelodysplastic syndromes.....	2064
Myelodysplastic syndromes, malignant.....	2064

Other haematologic disorders .....	2065
Other haematologic disorders, malignant.....	2065
Other haematologic disorders, uncertain whether benign or malignant.....	2065
Chronic myeloproliferative disorders .....	2065
Chronic myeloproliferative disorders, malignant.....	2065
Leukaemias .....	2066
leukaemias, NOS, malignant .....	2066
Lymphoid leukaemias, malignant .....	2067
Myeloid leukaemias, malignant .....	2068
Myeloid leukaemias, uncertain whether benign or malignant.....	2070
Other leukaemias, malignant.....	2070
Hodgkin and non-Hodgkin lymphomas.....	2070
Malignant lymphomas, NOS or diffuse .....	2070
Hodgkin lymphoma.....	2071
Non-Hodgkin lymphomas .....	2073
Immunoproliferative diseases .....	2077
Immunoproliferative diseases, malignant .....	2077
Immunoproliferative diseases, uncertain whether benign or malignant.....	2077
Plasma cell tumours.....	2078
Mast cell tumours .....	2078
Mast cell tumours, malignant .....	2078
Mast cell tumours, uncertain whether benign or malignant.....	2079
Neoplasms of histiocytes and accessory lymphoid cells.....	2079
Neoplasms of histiocytes and accessory lymphoid cells, malignant .....	2079
Neoplasms of histiocytes and accessory lymphoid cells, uncertain whether benign or malignant .....	2080
Dimensions of injury .....	2080
Dimensions of Burns .....	2080
Burns classified according to extent of body surface involved.....	2080
Extent of body surface with full thickness or deep full thickness burn .....	2081
Outcome of deep full thickness or complex burn.....	2081
Joint involvement in fracture .....	2082
Open fracture or closed fracture .....	2082
Fracture types .....	2082

Types of superficial injuries .....	2083
Dimensions of external causes .....	2084
Additional aspects of mechanism .....	2084
Exposure to other mechanism .....	2085
Activity when injured .....	2086
Sports, recreation or leisure activity .....	2087
Being taken care of .....	2087
Aspects of place of injury occurrence .....	2088
Type of place .....	2088
Part of place .....	2091
Objects, living things or substances involved in causing injury .....	2092
Land vehicle or means of land transport .....	2092
Mobile machinery or special purpose vehicle .....	2094
Watercraft or means of water transport .....	2094
Aircraft or means of air transport .....	2095
Utensil or container .....	2100
Item mainly for personal use .....	2100
Equipment mainly used in sports or recreational activity .....	2103
Weapon .....	2106
Person, animal or plant .....	2106
Building, building component, or related fitting .....	2109
Ground surface or surface conformation .....	2111
Material, not elsewhere classified .....	2111
Food, drink .....	2113
Alcohol use in injury event .....	2114
Psychoactive drug use in injury event .....	2115
Aspects of transport injury events .....	2115
Mode of transport of person injured in transport event .....	2115
Vehicle user role of person injured in transport event .....	2121
Counterpart in land transport crash .....	2122
Other mechanisms of transport injury without counterpart .....	2127
Aspects of sports injury events .....	2127
Type of sport or exercise activity .....	2127
Phase of sport or exercise activity .....	2135

Personal countermeasures in sport or exercise .....	2136
Environmental countermeasures in sport or exercise.....	2136
Aspects of occupational injury events .....	2137
Economic activity .....	2137
Occupation.....	2138
Aspects of assault and maltreatment .....	2138
Perpetrator-victim relationship .....	2138
Gender of perpetrator .....	2140
Context of assault and maltreatment.....	2140
Aspects of intentional self-harm events .....	2142
Proximal risk-factors for intentional self-harm.....	2142
Previous non-fatal intentional self harm .....	2143
Intention to die aspect of self-harm .....	2144
Aspects of armed conflict .....	2144
Type of armed conflict .....	2144
Role of injured person in armed conflict .....	2144
Type of legal intervention.....	2144
Aspects of incidents related to devices .....	2145
Investigation conclusion of events related to devices.....	2180
Findings of investigations related to devices.....	2180
Cause investigation and type of investigation.....	2191
Medical device component.....	2194
Biological and chemical medical device component .....	2194
Electrical and magnetic medical device component .....	2195
Measurement medical device component .....	2200
Mechanical medical device component .....	2202
Optical medical device component .....	2213
Safety medical device component.....	2214
Other component of medical device .....	2215
Consciousness .....	2215
Glasgow Coma Scale Eye opening score .....	2215
Glasgow Coma Scale Motor score .....	2216
Glasgow Coma Scale Verbal score .....	2216
Pupil reaction score .....	2216

Substances .....	2217
Medicaments .....	2217
Agents primarily affecting the gastrointestinal system .....	2217
Gastric acid secretion suppressants.....	2217
Histamine H <sub>2</sub> -receptor antagonists.....	2217
Other drugs for peptic ulcer and gastro-oesophageal reflux disease.....	2218
Drugs for functional gastrointestinal disorders .....	2219
Antidiarrhoeal drugs .....	2220
Digestants .....	2221
Antinauseants, antiemetics and emetics.....	2222
Other agents primarily affecting gastrointestinal system .....	2222
Other antacids and anti-gastric-secretion drugs .....	2223
Other laxatives .....	2224
Saline and osmotic laxatives .....	2225
Drugs for constipation .....	2226
Laxatives.....	2226
Propulsives .....	2228
Antipropulsives .....	2229
Agents primarily affecting blood constituents and immune system .....	2229
Antineoplastic agents.....	2229
Antineoplastic antimetabolites.....	2230
Antineoplastic natural products and derivatives .....	2231
Monoclonal antibodies .....	2232
Other antineoplastic drugs .....	2234
Immunostimulants .....	2241
Immunosuppressive agents .....	2243
Anticoagulants and antithrombotics .....	2246
Platelet aggregation inhibitors.....	2246
Anticoagulants .....	2248
Other fibrinolysis-affecting drugs .....	2249
Anticoagulant antagonists, vitamin K and other coagulants .....	2249
Natural blood and blood products.....	2250
Iron and its compounds .....	2252
Vitamin B12, folic acid and other anti-megaloblastic-anaemia preparations .....	2254

Enzymes .....	2254
Drugs used in hereditary angioedema.....	2255
Local hemostatics.....	2255
Other haematological agents.....	2256
Agents affecting genitourinary system, sex and anabolic hormones .....	2256
Other gynaecologicals.....	2256
Intrauterine and intravaginal contraceptives .....	2256
Estrogens and progestogens.....	2256
Estrogen receptor modulators.....	2259
Progesterone receptor modulators .....	2260
Androgens and anabolic congeners.....	2260
Other urologicals.....	2261
Drugs used in benign prostatic hypertrophy .....	2262
Hormones and their synthetic substitutes and antagonists, not elsewhere classified .....	2262
Anterior pituitary [adenohypophyseal] hormones and analogues.....	2262
Posterior pituitary hormones and analogues .....	2263
Hypothalamic hormones and analogues .....	2264
Gonadotropin releasing hormones and analogues.....	2264
Prolactin inhibitors.....	2265
Glucocorticoids and synthetic analogues .....	2265
Anticorticosteroids.....	2266
Antigonadotrophins, antiestrogens, antiandrogens, not elsewhere classified .....	2266
Thyroid hormones and substitutes .....	2268
Antithyroid drugs .....	2268
Iodine therapy.....	2269
Parathyroid hormones and analogues.....	2269
Antiparathyroid agents .....	2269
Insulin and antidiabetic drugs.....	2269
Sulfonamides (heterocyclic).....	2271
Agents affecting bones, joints and other connective tissue, not elsewhere classified .....	2274
Bisphosphonates.....	2274
Bone morphogenetic proteins .....	2274
Enzymes affecting bones, joints and other connective tissue, not elsewhere classified .	2274
Agents primarily affecting water and nutrition-balance and metabolism .....	2275

Drugs affecting uric acid metabolism and other antigout preparations .....	2275
Mineral salts and supplements, not elsewhere classified .....	2276
Electrolytic, caloric and water-balance agents .....	2279
Diuretics .....	2281
Loop [high-ceiling] diuretics.....	2283
Mineralocorticoids .....	2284
Vitamins and antioxidants .....	2284
Enzymes and digestants .....	2286
Agents in bile and liver therapy .....	2287
Antiobesity preparations .....	2288
Drugs used to treat enzyme deficiencies and disorders of aminoacid, glycolipid and glycoprotein metabolism .....	2289
Agents primarily affecting the cardiovascular system.....	2290
Agents acting on the renin-angiotensin system .....	2290
Antihyperlipidemic and antiarteriosclerotic drugs .....	2291
Calcium-channel blockers .....	2294
Cardiac stimulants.....	2295
Predominantly beta-adrenoreceptor agonists .....	2296
Antiarrhythmics .....	2299
Other antihypertensive drugs.....	2300
Vasodilators used in cardiac diseases .....	2303
Peripheral vasodilators .....	2305
Other agents primarily affecting the cardiovascular system .....	2307
Vasoprotectives .....	2308
Agents used in antivaricose therapy.....	2309
Drugs primarily affecting the autonomic nervous system.....	2309
Adrenergic agonists.....	2309
Adrenergic antagonists .....	2311
Alpha-adrenoreceptor antagonists.....	2311
Beta-adrenoreceptor antagonists.....	2311
Parasympatholytics [anticholinergics and antimuscarinics] and spasmolytics .....	2313
Parasympathomimetics [cholinergics] .....	2319
Anticholinesterase agents.....	2319
Ganglionic blocking drugs .....	2320

Drugs used in addictive disorders .....	2321
Antivertigo and motion sickness preparations .....	2321
Agents primarily acting on smooth and skeletal muscles and the respiratory system .....	2321
Oxytocic drugs.....	2321
Muscle relaxants .....	2322
Other drugs acting on muscles .....	2324
Expectorants and mucolytics .....	2326
Antitussives .....	2328
Respiratory stimulants .....	2332
Systemic antibiotics, anti-infectives and antiparasitics .....	2333

# CHAPTER 01

---

## Certain infectious or parasitic diseases

This chapter has 342 four-character categories.

Code range starts with 1A00

This chapter includes certain conditions caused by pathogenic organisms or microorganisms, such as bacteria, viruses, parasites or fungi.

**Exclusions:** Infection arising from device, implant or graft, not elsewhere classified (NE83.1)

**Coded Elsewhere:** Infections of the fetus or newborn (KA60-KA6Z)

Human prion diseases (8E00-8E0Z)

Pneumonia (CA40)

This chapter contains the following top level blocks:

- Gastroenteritis or colitis of infectious origin
- Predominantly sexually transmitted infections
- Mycobacterial diseases
- Certain staphylococcal or streptococcal diseases
- Pyogenic bacterial infections of the skin or subcutaneous tissues
- Certain zoonotic bacterial diseases
- Other bacterial diseases
- Human immunodeficiency virus disease
- Viral infections of the central nervous system
- Non-viral and unspecified infections of the central nervous system
- Dengue
- Certain arthropod-borne viral fevers
- Certain zoonotic viral diseases
- Certain other viral diseases
- Influenza
- Viral hepatitis
- Viral infections characterised by skin or mucous membrane lesions
- Mycoses
- Parasitic diseases
- Sepsis
- Sequelae of infectious diseases

## Gastroenteritis or colitis of infectious origin (1A00-1A40.Z)

**Coded Elsewhere:** Intestinal fungal infections

### Bacterial intestinal infections (1A00-1A0Z)

Any condition of the intestines, caused by an infection with a bacterial source.

**Exclusions:** Bacterial foodborne intoxications (1A10-1A1Z)

**Coded Elsewhere:** Abdominal actinomycosis (1C10.1)

Listerial gastroenteritis (1C1A.Y)

**1A00**

#### **Cholera**

Cholera is a potentially epidemic and life-threatening infection of the intestine, characterised by extreme watery (secretory) diarrhoea often accompanied by vomiting, with rapid depletion of body fluids and salt that may result in hypovolemic shock and acidosis. Cholera outbreaks are caused by toxigenic strains of *Vibrio cholerae* serogroups O1 and O139. Serogroup O1 has two biovars; classical and eltor. *Vibrio cholerae* O1, biovar cholerae is classical type. *Vibrio cholerae* O1, biovar eltor is eltor type.

**Inclusions:** cholera syndrome

**1A01**

#### **Intestinal infection due to other Vibrio**

**1A02**

#### **Intestinal infections due to Shigella**

A disease caused by an infection with the gram-negative bacteria genus *Shigella*. This disease is characterised by an acute onset of small volume diarrhoea, accompanied by fever and nausea. This disease may also present with toxæmia, vomiting, cramps, and tenesmus. Transmission is by ingestion of contaminated food, or direct contact. Confirmation is by identification of *Shigella* in a faecal sample.

**Coded Elsewhere:** Sepsis due to shigella with septic shock (1C41)

**1A03**

#### **Intestinal infections due to Escherichia coli**

Any condition of the gastrointestinal system, caused by an infection with the gram-negative bacteria *Escherichia coli*.

**1A03.0**

#### **Enteropathogenic *Escherichia coli* infection**

An infection of the gastrointestinal system, caused by the gram-negative bacteria *Escherichia coli*. It is characterised by acute, profuse, watery diarrhoea. Transmission is by the faecal-oral route from contaminated food, water, or fomites. Confirmation is by identification of enteropathogenic *Escherichia coli* (EPEC) in a faecal sample.

**1A03.1**

#### **Enterotoxigenic *Escherichia coli* infection**

A condition of the gastrointestinal system, caused by an infection with the gram-negative bacteria *Escherichia coli*. This condition is characterised by acute, watery diarrhoea due to toxins released from the bacteria. Transmission is by the faecal-oral route from ingestion of contaminated food, water, or fomites. Confirmation is by identification of the *Escherichia coli* in faecal sample.

- 1A03.2 Enteroinvasive Escherichia coli infection**  
A condition of the gastrointestinal system, caused by an infection with the gram-negative bacteria Escherichia coli. This condition is characterised by acute and profuse diarrhoea (that may be haemorrhagic), fever, and abdominal cramps. Transmission is by the faecal-oral route from ingestion of contaminated food or water. Confirmation is by identification of the Escherichia coli in a faecal sample.
- 1A03.3 Enterohaemorrhagic Escherichia coli infection**
- 1A03.Y Intestinal infections due to other specified Escherichia coli**
- 1A03.Z Intestinal infections due to Escherichia coli, unspecified**
- 1A04 Intestinal infections due to Clostridioides difficile**  
A disease of the colon, caused by an infection with the gram-positive bacteria Clostridioides difficile (formerly known as Clostridium difficile). This disease is characterised by colitis, diarrhoea, abdominal pain, and fever. Transmission is commonly by direct or indirect contact, or from a disturbance of the normal bacterial flora of the colon. Confirmation is by identification of Clostridioides difficile in a faecal sample.
- Exclusions:** Necrotising enterocolitis of newborn (KB88)
- 1A05 Intestinal infections due to Yersinia enterocolitica**  
A disease of the intestinal tract, caused by an infection with the gram-negative bacteria Yersinia enterocolitica. This disease commonly presents with a fever, diarrhoea, or abdominal pain. This disease may also lead to a systemic infection. Transmission is by the faecal-oral route from the ingestion of contaminated food or water, or direct contact with infected individuals or animal. Confirmation is by identification of Yersinia enterocolitica in a faecal sample.
- Exclusions:** Extraintestinal yersiniosis (1B9A)
- Coded Elsewhere:** Postinfectious arthropathy in enteritis due to Yersinia enterocolitica (1A05)
- 1A06 Gastroenteritis due to Campylobacter**
- 1A07 Typhoid fever**  
A condition caused by an infection with the gram-negative bacteria Salmonella typhi. This condition is characterised by an acute sustained fever. This condition may present with weakness, stomach pains, headache, loss of appetite, or flat, rose-coloured spots. Transmission is by the faecal-oral route from the ingestion of contaminated food or water. Confirmation is by identification of Salmonella typhi in a faecal or blood sample.
- 1A07.0 Typhoid peritonitis**
- 1A07.Y Other specified typhoid fever**
- 1A07.Z Typhoid fever, unspecified**

**1A08****Paratyphoid fever**

A condition caused by an infection with the gram-negative bacteria *Salmonella paratyphi*. This condition is characterised by an acute sustained fever. The individual may feel weak, have stomach pains, headache, loss of appetite, or a rash of flat, rose-coloured spots. Transmission is by ingestion of contaminated food or water. Confirmation is by identification of *Salmonella paratyphi* in a faecal or blood sample.

**1A09****Infections due to other *Salmonella*****Coding Note:**

Infection or foodborne intoxication due to any *Salmonella* species other than *S. typhi* and *S. paratyphi*

**1A09.0*****Salmonella enteritis***

This refers to inflammation of the small intestine due to infection with bacteria of the genus *Salmonella*, a member of the family Enterobacteriaceae. Bacteria of the genus *Salmonella* are rod-shaped, Gram-negative, non-spore-forming and predominantly motile.

**1A09.Y****Infections due to other *Salmonella* in other organs****Coding Note:**

Infection or foodborne intoxication due to any *Salmonella* species other than *S. typhi* and *S. paratyphi*

**1A09.Z*****Salmonella infection, unspecified*****Coding Note:**

Infection or foodborne intoxication due to any *Salmonella* species other than *S. typhi* and *S. paratyphi*

**1A0Y****Other specified bacterial intestinal infections****1A0Z****Bacterial intestinal infections, unspecified**

Bacterial foodborne intoxications (1A10-1A1Z)

Any condition caused by an infection with a bacterial source. Transmission is by ingestion of contaminated food.

**Exclusions:**

*salmonella* foodborne intoxication and infection (1A09)

*Listeriosis* (1C1A)

Harmful effects of or exposure to noxious substances, Substances chiefly nonmedicinal as to source, Other noxious substances eaten as food (NE61)

*Ichthyotoxicosis* not specified as bacterial (NE61)

**1A10****Foodborne staphylococcal intoxication****1A11****Botulism**

A disease caused by an infection with the gram-positive bacteria *Clostridium botulinum*. This disease commonly presents with abdominal pain, vomiting, acute paralysis, blurred vision, diplopia, and may be fatal. Transmission is by ingestion of contaminated food, direct contact, or from accidental overdose. Confirmation is by identification of *Clostridium botulinum* in a faecal or food sample.

- 1A11.0** **Foodborne intoxication by botulinum toxin**
- 1A11.1** **Other forms of botulism**
- 1A11.Z** **Botulism, unspecified**
- 1A12** **Foodborne Clostridium perfringens intoxication**
  - Inclusions:** enteritis necroticans
  - foodborne Clostridium welchii intoxication
- 1A13** **Foodborne Bacillus cereus intoxication**
- 1A1Y** **Other specified bacterial foodborne intoxications**
- 1A1Z** **Bacterial foodborne intoxications, unspecified**

**Viral intestinal infections (1A20-1A2Z)**

Any condition of the intestines, caused by an infection with a viral source.

- Exclusions:** influenza with involvement of gastrointestinal tract (1E32)
- Coded Elsewhere:** Herpes simplex virus duodenitis (1F00.Y)
- Human immunodeficiency virus disease enteritis (1C62.2)

- 1A20** **Enteritis due to Adenovirus**

A disease of the intestinal tract, caused by an infection with adenovirus. This disease is characterised by a fever, diarrhoea, or vomiting. Transmission is by the faecal-oral route.
- 1A21** **Gastroenteritis due to Astrovirus**
- 1A22** **Gastroenteritis due to Rotavirus**

A disease of the gastrointestinal tract, caused by an infection with rotavirus. This disease is characterised by acute onset of vomiting, non-haemorrhagic diarrhoea, and abdominal pain. Transmission is by ingestion of contaminated food or water, direct contact, or through fomites. Confirmation is by identification of rotavirus.
- 1A23** **Enteritis due to Norovirus**

A disease of the gastrointestinal tract, caused by an infection with norovirus. This disease is characterised by acute onset of vomiting, non-haemorrhagic diarrhoea, and abdominal pain. Transmission is by ingestion of contaminated food or water, direct contact, or through fomites. Confirmation is by identification of norovirus.
- 1A24** **Intestinal infections due to Cytomegalovirus**

A condition of the intestinal tract, caused by an infection with cytomegalovirus. The condition is characterised by diarrhoea, fever, abdominal pain, or haematochezia. Transmission is by direct contact with infected body fluids.
- 1A2Y** **Other specified viral intestinal infections**
- 1A2Z** **Viral intestinal infections, unspecified**

**Protozoal intestinal infections (1A30-1A3Z)**

Any condition of the intestines, caused by an infection with a protozoal parasitic source.

**1A30**

**Infections due to *Balantidium coli***

Any condition caused by an infection with the protozoan parasite *Balantidium coli*.

**1A31**

**Giardiasis**

A condition caused by an infection with the protozoan parasite *Giardia*. This condition is characterised by gastroenteritis, or may be asymptomatic. Transmission is by the faecal-oral route from the ingestion of contaminated food or water. Confirmation is by identification of *Giardia* in a faecal sample.

**1A32**

**Cryptosporidiosis**

Any condition caused by an infection with the protozoan parasite *Cryptosporidium*.

**1A33**

**Cystoisosporiasis**

A disease caused by the protozoan parasite *Cystoisospora belli*. This disease is characterised by watery diarrhoea, fever, abdominal pain, nausea, or malaise. Transmission is by the faecal-oral route, commonly through the ingestion of contaminated food or water. Confirmation is by identification of *Cystoisospora belli* in a faecal sample.

**1A33.0**

**Cystoisosporiasis of small intestine**

*Inclusions:*            Infection due to *Isopora belli*  
                            Infection due to *Isopora hominis*

**1A33.1**

**Cystoisosporiasis of colon**

*Isosporiasis* of colon is a large intestinal inflammation caused by the protozoan *Isospora belli*.

**1A33.Y**

**Other specified cystoisosporiasis**

**1A33.Z**

**Cystoisosporiasis, unspecified**

**1A34**

**Sarcocystosis**

Any condition caused by an infection with the protozoan parasite *Sarcocystis*.

*Inclusions:*            Sarcosporidiosis

**1A35**

**Blastocystosis**

**1A36**

**Amoebiasis**

*Inclusions:*            Infection due to *Entamoeba histolytica*

**1A36.0**

**Intestinal infections due to *Entamoeba***

<b>1A36.00</b>	Acute amoebiasis A disease caused by an infection with the protozoan parasite Entamoeba histolytica. This disease is characterised by fever, abdominal pain, tenesmus, or diarrhoea containing blood. Transmission is by the faecal-oral route or ingestion of contaminated food or water. Confirmation is by identification of Entamoeba histolytica in a faecal or blood sample.
	<b>Inclusions:</b> amoebic dysentery
<b>1A36.01</b>	Amoeboma of intestine <b>Coded Elsewhere:</b> Amoeboma of large intestine (1A36.0Z)
<b>1A36.0Z</b>	Intestinal infections due to Entamoeba, unspecified
<b>1A36.1</b>	<b>Extraintestinal infections due to Entamoeba</b>
<b>1A36.10</b>	Amoebic liver abscess <b>Inclusions:</b> Hepatic amoebiasis
<b>1A36.11</b>	Amoebic lung abscess
<b>1A36.12</b>	Cutaneous amoebiasis
<b>1A36.1Y</b>	Amoebiasis of other specified sites
<b>1A36.Z</b>	Amoebiasis, unspecified
<b>1A3Y</b>	<b>Other specified protozoal intestinal infections</b>
<b>1A3Z</b>	<b>Protozoal intestinal infections, unspecified</b>
<b>1A40</b>	<b>Gastroenteritis or colitis without specification of infectious agent</b> <b>Inclusions:</b> enteritis septic gastroenteritis septic <b>Exclusions:</b> Noninfectious neonatal diarrhoea (KB8C) noninfective diarrhoea (ME05.1)
<b>1A40.0</b>	<b>Gastroenteritis or colitis without specification of origin</b> There is no mention whether the gastroenteritis or colitis is infectious or non-infectious.
<b>1A40.Z</b>	<b>Infectious gastroenteritis or colitis without specification of infectious agent</b>

## Predominantly sexually transmitted infections (1A60-1A9Z)

**Exclusions:** Nonspecific and nongonococcal urethritis (GC02.1)  
Arthropathy following genitourinary infection (FA11.2)

**Coded Elsewhere:** Sexually transmissible viral hepatitis  
Herpes simplex labialis (1F00.01)  
Herpes simplex gingivostomatitis (1F00.02)  
Vulvovaginal candidosis (1F23.10)  
Candida balanoposthitis (1F23.11)  
Human immunodeficiency virus disease (1C60-1C62.Z)  
Other infections with a predominantly sexual mode of transmission complicating pregnancy, childbirth or the puerperium (JB63.3)  
Candidosis of external genitalia (1F23.1Z)  
Anogenital molluscum contagiosum (1E76)

## Syphilis (1A60-1A6Z)

A predominantly sexually transmitted infection caused by *Treponema pallidum* ssp. *pallidum*.

**Coded Elsewhere:** Syphilis complicating pregnancy, childbirth or the puerperium (JB63.1)

### 1A60

#### **Congenital syphilis**

A disease caused by an infection with the gram-negative bacteria *Treponema pallidum pallidum* in utero. This disease may present with clinical signs depending on the stage of disease. Transmission is by vertical transmission.

### 1A60.0

#### **Early congenital syphilis, symptomatic**

A disease affecting newborns or children up to 2 years of age, caused by an infection with the gram-negative bacteria *Treponema pallidum pallidum* in utero. This disease is characterised by premature birth, hepatosplenomegaly, skeletal abnormalities, and bullous skin disease. Transmission is by vertical transmission.

### 1A60.1

#### **Early congenital syphilis, latent**

### 1A60.2

#### **Late congenital syphilitic oculopathy**

This is a late congenital, sexually transmitted infection caused by the spirochete bacterium *Treponema pallidum* subspecies *pallidum*. This diagnosis is with oculopathy.

### 1A60.3

#### **Late congenital neurosyphilis**

Neurological sequelae of longstanding (> 2 years) untreated congenital neurosyphilis include mental delay, hydrocephalus, seizures, cerebral infarction and cranial nerve palsies.

### 1A60.4

#### **Other late congenital syphilis, symptomatic**

### 1A60.5

#### **Late congenital syphilis, latent**

### 1A60.Z

#### **Congenital syphilis, unspecified**

**1A61****Early syphilis**

A disease caused by an infection with the gram-negative bacteria *Treponema pallidum pallidum*, including primary and secondary stages of syphilis, and early latent syphilis of less than 2 years duration. This disease is characterised by a single chancre in the primary stage, and diffuse rash in the secondary stage. Transmission is commonly by sexual contact.

**Exclusions:** Early congenital syphilis (1A60)

**1A61.0****Primary genital syphilis**

A disease caused by an infection with the gram-negative bacteria *Treponema pallidum pallidum*. This disease is characterised by a single chancre in the genital region. Transmission is commonly by sexual contact.

**1A61.1****Primary anal syphilis****1A61.2****Primary syphilis of other sites****1A61.3****Secondary syphilis of skin or mucous membranes**

A disease caused by an infection with *Treponema pallidum pallidum*. This disease is characterised by lesions of the skin and mucous membranes. Transmission is commonly by sexual contact.

**1A61.4****Secondary syphilis of other sites**

A disease caused by an infection with the gram-negative bacteria *Treponema pallidum pallidum*. This disease is characterised by less common symptoms of syphilis, including hepatitis, kidney disease, arthritis, periostitis, optic neuritis, uveitis, or interstitial keratitis. Transmission is commonly by sexual contact.

**1A61.5****Latent early syphilis**

A disease caused by an infection with the gram-negative bacteria *Treponema pallidum pallidum*. This disease is characterised by serologic proof of infection without symptoms of disease less than 1 year after secondary syphilis. Transmission is commonly by sexual contact.

**1A61.Y****Other specified early syphilis****1A61.Z****Early syphilis, unspecified****1A62****Late syphilis**

A disease caused by an infection with the gram-negative bacteria *Treponema pallidum pallidum*. This disease is characterised by gummas, neurological abnormalities, or cardiac abnormalities. Clinical signs normally manifest approximately 3-15 years after initial infection. Transmission is commonly by sexual contact.

**Exclusions:** Late congenital syphilis (1A60)

<b>1A62.0</b>	<b>Neurosyphilis</b> A disease of the brain or spinal cord caused by an infection with the gram-negative bacteria <i>Treponema pallidum pallidum</i> . This disease is characterised by four different forms: meningovascular, tabes dorsalis, general paresis, or may be asymptomatic. Clinical signs normally manifest approximately 4-25 years after initial infection. Transmission is commonly by sexual contact.
<b>1A62.00</b>	Asymptomatic neurosyphilis
<b>1A62.01</b>	Symptomatic late neurosyphilis A diverse constellation of neuropsychiatric signs resulting from prolonged untreated or inadequately treated syphilis. The protean clinical manifestations include chronic, insidious meningeal inflammation with cranial nerve palsy, cognitive and/or behavioural impairment, ataxia, stroke, seizures and visual or auditory impairment.
	<b>Coded Elsewhere:</b> Dementia due to neurosyphilis (6D85.Y) Meningitis due to <i>Treponema pallidum</i> (1D01.0Y)
<b>1A62.0Z</b>	Neurosyphilis, unspecified
<b>1A62.1</b>	<b>Cardiovascular late syphilis</b> This is a late, sexually transmitted infection caused by the spirochete bacterium <i>Treponema pallidum</i> subspecies <i>pallidum</i> . This diagnosis is involving the cardiovascular area.
<b>1A62.2</b>	<b>Symptomatic late syphilis of other sites</b>
<b>1A62.20</b>	Ocular late syphilis This is a late, sexually transmitted infection caused by the spirochete bacterium <i>Treponema pallidum</i> subspecies <i>pallidum</i> . This diagnosis is with ocular.
<b>1A62.21</b>	Late syphilis involving the musculoskeletal system This is a late, sexually transmitted infection caused by the spirochete bacterium <i>Treponema pallidum</i> subspecies <i>pallidum</i> . This diagnosis is involving the musculoskeletal system.
<b>1A62.22</b>	Late syphilis of skin or mucous membranes This is a late, sexually transmitted infection caused by the spirochete bacterium <i>Treponema pallidum</i> subspecies <i>pallidum</i> . This diagnosis is involving the skin and mucous membranes.
<b>1A62.2Y</b>	Symptomatic late syphilis of other specified sites
<b>1A62.2Z</b>	Symptomatic late syphilis of unspecified site
<b>1A62.Y</b>	<b>Other specified late syphilis</b>
<b>1A62.Z</b>	<b>Late syphilis, unspecified</b>

**1A63****Latent syphilis, unspecified as early or late**

A disease caused by an infection with the gram-negative bacteria *Treponema pallidum pallidum*. This disease is characterised by serologic proof of infection without symptoms of disease. Transmission is commonly by sexual contact.

*Inclusions:* Positive serological reaction for syphilis

**1A6Z****Syphilis, unspecified**

Gonococcal infection (1A70-1A7Z)

A condition caused by an infection with the gram-negative bacteria *Neisseria gonorrhoeae*. Transmission is by sexual contact. Confirmation is by identification of *Neisseria gonorrhoeae*.

**Coded Elsewhere:** Gonorrhoea complicating pregnancy, childbirth or the puerperium (JB63.2)

**1A70****Gonococcal genitourinary infection****1A70.0****Gonococcal infection of lower genitourinary tract without periurethral or accessory gland abscess**

*Exclusions:* Gonococcal infection of lower genitourinary tract with periurethral or accessory gland abscess (1A70.1)

**1A70.00**

Gonorrhoea of penis

**1A70.0Y**

Other specified gonococcal infection of lower genitourinary tract without periurethral or accessory gland abscess

**1A70.0Z**

Gonococcal infection of lower genitourinary tract without periurethral or accessory gland abscess, unspecified

**1A70.1****Gonococcal infection of lower genitourinary tract with periurethral or accessory gland abscess****1A70.Y****Gonococcal infection of other specified genitourinary organ****1A70.Z****Gonococcal genitourinary infection, unspecified****1A71****Gonococcal pelviperitonitis**

This is an inflammation of the peritoneum, the thin tissue that lines the inner wall of the abdomen and covers most of the abdominal organs.

**1A72****Gonococcal infection of other sites****1A72.0****Gonococcal infection of musculoskeletal system**

This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea. This diagnosis is of the musculoskeletal system.

**1A72.1****Gonococcal infection of rectum**

This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea of the rectum.

- 1A72.2 Gonococcal infection of anus**  
This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea. This diagnosis is of the anus.
- 1A72.3 Gonococcal pharyngitis**
- 1A72.4 Gonococcal infection of eye**  
This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea. This diagnosis is of the eye.
- Coded Elsewhere:** Neonatal conjunctivitis or dacryocystitis due to Neisseria gonorrhoeae (KA65.0)
- 1A72.Y Gonococcal infection of other specified sites**
- 1A73 Disseminated gonococcal infection**  
Disseminated gonococcal infection occurs when there is bacteremic dissemination of Neisseria gonorrhoeae from its initial focus of infection in female pelvic organs. It manifests as pain and swelling around one or more joints, intermittent crops of erythematous papules and pustules on the limbs, fever and rigors. Blood cultures may be but are not always positive.
- 1A7Z Gonococcal infection, unspecified**

#### Sexually transmissible infections due to chlamydia (1A80-1A8Z)

An infection with the gram-negative bacteria Chlamydia trachomatis. This infection may be asymptomatic or characterised by fever, painful urination, urinary urgency, dyspareunia, vaginal bleeding or discharge, pain in the abdomen in females and by fever, urethritis, painful urination, discharge from the penis, swollen or tender testicles in males. Transmission is by anal, vaginal, or oral sex. Confirmation is by identification of Chlamydia trachomatis.

- 1A80 Chlamydial lymphogranuloma**  
A disease of the inguinal lymph glands, caused by an infection with the gram-negative bacteria Chlamydia trachomatis. This disease is characterised by a genital ulcer, buboes, abscesses in the groin, blood in faeces, tenesmus, or proctocolitis. Transmission is by sexual contact. Confirmation is by identification of Chlamydia trachomatis in a blood sample or by polymerase chain reaction tests.
- Inclusions:** Durand-Nicolas-Favre disease
- 1A81 Non-ulcerative sexually transmitted chlamydial infection**
- Exclusions:** Neonatal chlamydial pneumonia (KB24)  
Neonatal conjunctivitis due to Chlamydia (KA65.0)  
Chlamydial lymphogranuloma (1A80)  
Chlamydial peritonitis (1C21)  
Trachoma (1C23)

- 1A81.0 Chlamydial infection of lower genitourinary tract**

- 1A81.1** **Chlamydial infection of internal reproductive organs**
- 1A81.Y** **Non-ulcerative sexually transmitted chlamydial infection of other specified site**
- 1A81.Z** **Non-ulcerative sexually transmitted chlamydial infection of unspecified site**
- 1A8Y** **Other specified sexually transmissible infections due to chlamydia**
- 1A8Z** **Sexually transmissible infections due to chlamydia, unspecified**
- 1A90** **Chancroid**  
A disease caused by an infection with the gram-negative bacteria *Haemophilus ducreyi*. This disease is characterised by painful ulcer(s) on the genitalia. Transmission is by sexual contact. Confirmation is by identification of *Haemophilus ducreyi* from the ulcer exudate.
- Inclusions:** Ulcus molle
- 1A91** **Granuloma inguinale**  
A disease caused by infection with the gram-negative bacterium *Klebsiella granulomatis*. It commonly presents with painless genital ulceration following contact with an infected sexual partner. Small, painless nodules appear after an incubation period of about 10–40 days; later the nodules break down to create open, fleshy, oozing ulcers which gradually extend, mutilating the infected tissue. The lesions occur at the region of contact and are typically found on the shaft of the penis, the labia, or the perineum.
- Inclusions:** Donovanosis
- 1A92** **Trichomoniasis**  
A disease caused by an infection with the protozoan parasite *Trichomonas*. This disease presents with symptoms depending on the site of infection.
- Coded Elsewhere:** Intestinal trichomoniasis (1A3Y)
- 1A93** **Sexually transmissible infestations**  
**Coded Elsewhere:** Scabies (1G04)  
Pubic infestation by *Pthirus pubis* (1G03)
- 1A94** **Anogenital herpes simplex infection**  
A condition of the anogenital region, caused by an infection with herpes simplex virus type 1 or 2. This condition is characterised by vesicles, or may be asymptomatic. Transmission is by sexual contact. Confirmation is by identification of herpes simplex virus type 1 or 2.
- 1A94.0** **Herpes simplex infection of genitalia or urogenital tract**  
Herpes simplex infection affecting the vulva and vagina in women and the penis in men. It is more commonly due to infection with Herpes simplex type 2 virus than with type 1 virus.

- 1A94.1**      **Herpes simplex infection of perianal skin or rectum**  
Herpes simplex infection of perianal skin and rectum. This is commonly due to Herpes simplex virus type 2 and acquired through anal sexual contact.
- 1A94.Z**      **Anogenital herpes simplex infection without further specification**
- 1A95**      **Anogenital warts**  
Anogenital warts are due to an infection of anogenital skin and mucous membranes by certain human papilloma viruses, most commonly HPV subtypes 6, 11, 16 and 18. Transmission is predominantly by sexual contact. They manifest typically as flat plaques or papillomatous, keratinous growths on and adjacent to the external genitalia and anus. Some HPV subtypes, including types 16 and 18, are oncogenic and predispose to the development of anogenital cancers.  
**Coded Elsewhere:** Anogenital verrucous carcinoma of Buschke and Lowenstein (2C31.0)
- 1A95.0**      **Anal warts**  
Infection of the anus or perianal skin by human papillomavirus (HPV). Although the majority of such infections are sexually transmitted and caused by HPV subtypes responsible for genital warts, autoinoculation from common warts, especially on the hands in children, may also cause perianal warts.  
**Inclusions:**      Condylomata acuminata of anus
- 1A95.1**      **Genital warts**  
Infection of anogenital mucosa or skin by the human papillomavirus. The infection is commonly asymptomatic but manifests typically as flat, papular or pedunculated growths depending on the site of infection. Transmission is normally by sexual contact.
- 1A95.2**      **Extragenital condylomata acuminata**  
Anogenital warts transmitted to extragenital sites (i.e. beyond the anogenital region). This may be through autoinoculation of anogenital wart virus to moist, intertriginous sites on the abdomen or under the breasts, or as a result of sexual activity, particularly to the lips and oral cavity.  
**Inclusions:**      Anogenital warts affecting sites other than the anogenital area
- 1A95.Z**      **Anogenital warts, unspecified**
- 1A9Y**      **Other specified predominantly sexually transmitted infections**
- 1A9Z**      **Predominantly sexually transmitted infections, unspecified**

## Mycobacterial diseases (1B10-1B2Z)

### Tuberculosis (1B10-1B1Z)

A disease caused by an infection with bacteria of the *Mycobacterium tuberculosis* complex. This disease presents with symptoms depending on the site of infection. Transmission is commonly by inhalation of infected respiratory secretions.

**Inclusions:** Infections due to *Mycobacterium tuberculosis* and *Mycobacterium bovis*

**Exclusions:** Pneumoconiosis associated with tuberculosis (CA60.3)

**Coded Elsewhere:** Congenital tuberculosis (KA61.0)

Tuberculosis complicating pregnancy, childbirth or the puerperium (JB63.0)

HIV disease clinical stage 1 associated with tuberculosis (1C60.0)

HIV disease clinical stage 2 associated with tuberculosis (1C60.1)

HIV disease clinical stage 3 associated with tuberculosis (1C60.2)

HIV disease clinical stage 4 associated with tuberculosis (1C60.3)

Human immunodeficiency virus disease associated with tuberculosis (1C60)

Tuberculosis of orbit (9A22.2)

#### 1B10

### Tuberculosis of the respiratory system

This is a progressive or chronic disease resulting from infection with the bacterium *Mycobacterium tuberculosis* or other bacteria in the *M. tuberculosis* complex: *M. bovis*, *M. africanum*, *M. canetti*, *M. microti* and *M. pinnipedii*. The infection is limited to the respiratory system.

#### 1B10.0

### Respiratory tuberculosis, confirmed

A disease of the respiratory tract, caused by an infection with the bacteria *Mycobacterium tuberculosis*, which has been confirmed by laboratory testing. This disease is characterised by chronic cough, and sputum production that may be haemorrhagic. Transmission is commonly by inhalation of infected respiratory secretions. Confirmation is by identification of *Mycobacterium tuberculosis* in clinical samples.

#### 1B10.1

### Respiratory tuberculosis, not confirmed

A disease of the respiratory tract, caused by an infection with the bacteria *Mycobacterium tuberculosis*, which has not been confirmed. This disease is characterised by a chronic cough, and sputum production that may be haemorrhagic. Transmission is commonly by inhalation of infected respiratory secretions.

#### 1B10.Z

### Respiratory tuberculosis, without mention of bacteriological or histological confirmation

**1B11****Tuberculosis of the nervous system**

A disease of the central nervous system, caused by an infection with bacteria of the Mycobacterium tuberculosis complex. This disease is characterised by neurological deficits depending on the site affected. Transmission is through haematogenous spread to the nervous system after inhalation of infected respiratory secretions. Confirmation is by identification of bacteria of the Mycobacterium tuberculosis complex in the cerebrospinal fluid.

**1B11.0****Tuberculous meningitis**

A disease of the meninges, caused by an infection with the bacteria Mycobacterium tuberculosis. This disease is characterised by fever, headache, or neurological deficits. Transmission is through haematogenous spread to the meninges after inhalation of infected respiratory secretions. Confirmation is by identification of Mycobacterium tuberculosis in the cerebrospinal fluid.

**Inclusions:**      Tuberculous leptomeningitis

**1B11.1****Tuberculous meningoencephalitis****1B11.2****Meningeal tuberculoma**

Meningeal tuberculomas are conglomerate caseous foci within the meninges of the brain, caused by dissemination of tuberculosis to the central nervous system.

**Inclusions:**      Tuberculoma of meninges

**1B11.3****Tuberculous granuloma of brain****1B11.Y****Tuberculosis of other specified part of nervous system****1B11.Z****Tuberculosis of the nervous system, unspecified****1B12****Tuberculosis of other systems and organs****1B12.0****Tuberculosis of heart**

Mycobacterium tuberculosis infection involving the heart and pericardium

**1B12.1****Tuberculosis of eye**

Tuberculosis involving the eye. This may manifest in multiple different ways including keratoconjunctivitis, episcleritis, anterior uveitis and posterior uveitis

**Exclusions:**      lupus vulgaris of eyelid (1B12.8)

**1B12.2****Tuberculosis of ear**

This is a common, and in many cases lethal, infectious disease caused by various strains of mycobacteria, usually Mycobacterium tuberculosis. This diagnosis is of the ear.

**Exclusions:**      tuberculosis of skin of external ear (1B12.8)

    Tuberculous mastoiditis (1B12.40)

**1B12.3****Tuberculosis of endocrine glands**

Infection of endocrine glands by Mycobacterium tuberculosis with resultant endocrine disturbances including adrenal or pituitary failure.

**Coded Elsewhere:** Tuberculous Addison disease (1B12.3)

- 1B12.4** **Tuberculosis of the musculoskeletal system**  
**Coded Elsewhere:** Mycobacterial infection of vertebra (FA90.1)
- 1B12.40** Tuberculosis of bones or joints  
A disease of the bones and joints, caused by an infection with the bacteria *Mycobacterium tuberculosis*. This disease commonly presents with bone pain, joint inflammation, loss of movement or feeling in the affected bone or joint, and weak bones prone to fracture. Transmission is through haematogenous spread to the bones and joints after inhalation of infected respiratory secretions. Confirmation is by identification of *Mycobacterium tuberculosis* in biopsy samples of the affected site.
- 1B12.41** Tuberculous myositis
- 1B12.4Y** Tuberculosis of other specified part of the musculoskeletal system
- 1B12.4Z** Tuberculosis of the musculoskeletal system, unspecified
- 1B12.5** **Tuberculosis of the genitourinary system**  
Tuberculosis involving the urinary tract and/or reproductive organs. The primary site of infection is most commonly the kidney as a result of haematogenous spread from distant sites: infection may then spread further down the urinary tract and/or to the reproductive organs. Genital infection may be sexually transmitted.
- 1B12.6** **Tuberculous peripheral lymphadenopathy**  
A disease of the peripheral lymph nodes, caused by an infection with the bacteria *Mycobacterium tuberculosis*. This disease is characterised by inflammation of the peripheral lymph nodes, typically the cervical lymph nodes. Transmission is through haematogenous spread to the peripheral lymph nodes after inhalation of infected respiratory secretions. Confirmation is by identification of *Mycobacterium tuberculosis* from lymph node biopsies.
- Inclusions:** Tuberculous adenitis
- Exclusions:** Tuberculosis of intrathoracic lymph nodes, confirmed bacteriologically or histologically (1B10.0)  
Tuberculosis of intrathoracic lymph nodes, without mention of bacteriological or histological confirmation (1B10)
- 1B12.7** **Tuberculosis of the digestive system**  
Tuberculosis of the digestive tract or hepatobiliary system
- 1B12.8** **Cutaneous tuberculosis**  
Tuberculosis involving the skin and mucous membranes including lupus vulgaris, scrofuloderma and periorificial tuberculosis.
- Exclusions:** Tuberculids (EA40-EA5Z)  
Skin complications of BCG immunisation (EA51)
- Coded Elsewhere:** Acute miliary cutaneous tuberculosis (1B13.0)
- 1B12.Y** **Tuberculosis of other specified organ or site**
- 1B13** **Miliary tuberculosis**

- 1B13.0 Acute miliary tuberculosis of a single specified site**  
A disease caused by an infection with the bacteria Mycobacterium tuberculosis that is disseminated through the body, and affecting a specific body site. This disease is characterised by numerous small lesions of 1-5 millimetre(s) in any organ, and fever. Transmission is commonly by inhalation of infected respiratory secretions. Confirmation is by radiography, CT, ultrasonography, and identification of Mycobacterium tuberculosis, depending on the site affected.
- 1B13.1 Acute miliary tuberculosis of multiple sites**  
A disease caused by an infection with the bacteria Mycobacterium tuberculosis that is disseminated through the body, and affecting multiple body sites. This disease is characterised by numerous small lesions of 1-5 millimetre(s) in more than one organ, and fever. Transmission is commonly by inhalation of infected respiratory secretions. Confirmation is by radiography, advanced imaging, ultrasonography, and identification of Mycobacterium tuberculosis, depending on the sites affected.
- 1B13.2 Acute miliary tuberculosis, unspecified site**
- 1B13.Y Other specified miliary tuberculosis**
- 1B13.Z Miliary tuberculosis, unspecified**
- 1B14 Latent tuberculosis**
- 1B1Y Other specified tuberculosis**
- 1B1Z Tuberculosis, unspecified**
- 1B20 Leprosy**  
A disease caused by an infection with Mycobacterium leprae. This disease commonly presents with a long asymptomatic period followed by granulomatous lesions of the skin, respiratory tract, and peripheral nerves. Transmission is commonly by droplet transmission. Confirmation is by identification of Mycobacterium leprae with skin biopsy.  
*Inclusions:* Infection due to Mycobacterium leprae
- 1B20.0 Paucibacillary leprosy**
- 1B20.1 Multibacillary leprosy**
- 1B20.2 Leprosy reactions**
- 1B20.20 Type I leprosy reaction**  
This phenomenon, also named “upgrading reaction,” occurs in borderline leprosy states and is associated with an increase in cell-mediated immunity. It occurs typically within the first 6 months of treatment in previously untreated patients but may be related to stress, intercurrent infections, or pregnancy. Clinical features include inflammatory swelling, erythema and occasionally ulceration of existing lesions, constitutional symptoms and neuritis. If the neuritis is not treated promptly permanent motor nerve damage may ensue.

- 1B20.21** Type II leprosy reaction  
This phenomenon, also named downgrading reaction, occurs in borderline leprosy states and is associated with a decrease in cell-mediated immunity with a shift towards the lepromatous end of the clinical spectrum.
- 1B20.3** **Complications of leprosy**
- 1B20.Z** **Leprosy, unspecified**
- 1B21** **Infections due to non-tuberculous mycobacteria**  
Any condition caused by an infection with Mycobacteria excluding infections due to *Mycobacterium tuberculosis* complex and *Mycobacterium leprae*. These conditions commonly present with lung disease; however, symptoms are dependent on the site of infection. Transmission is by direct contact with non-tuberculous Mycobacteria in the environment. Confirmation is by identification of non-tuberculous Mycobacteria from the affected site(s).
- Exclusions:** Leprosy (1B20)  
Tuberculosis (1B10-1B1Z)
- 1B21.0** **Pulmonary infection due to non-tuberculous mycobacterium**  
A condition of the pulmonary system, caused by an infection with the bacteria *Mycobacterium* (excluding infections due to *Mycobacterium tuberculosis* and *Mycobacterium leprae*). This disease is characterised by cough, fever, weight loss, and fatigue. Transmission is by direct contact with *Mycobacterium* in the environment.
- 1B21.1** **Non-tuberculous mycobacterial lymphadenitis**
- 1B21.2** **Cutaneous non-tuberculous mycobacterial infection**  
**Exclusions:** Leprosy (1B20)  
Tuberculosis (1B10-1B1Z)
- 1B21.20** ***Mycobacterium ulcerans* infection**  
*Mycobacterium ulcerans* infection (Buruli ulcer) typically presents as a subcutaneous nodule which breaks down to form a deep painless ulcer which commonly reaches a size of 15 cm in diameter but may extend further to cause extensive tissue damage. The organism is found in wetlands of tropical and subtropical regions of the world, particularly Africa [Dermatology TAG].
- 1B21.2Y** Cutaneous infection due to other specified non-tuberculous mycobacteria
- 1B21.2Z** Cutaneous infection due to unspecified non-tuberculous mycobacteria
- 1B21.3** **Disseminated non-tuberculous mycobacterial infection**
- 1B21.4** **Gastrointestinal non-tuberculous mycobacterial infection**
- 1B21.Y** **Non-tuberculous mycobacterial infection of other specified site**
- 1B21.Z** **Non-tuberculous mycobacterial infection of unspecified site**
- 1B2Y** **Other specified mycobacterial diseases**

**1B2Z**

**Mycobacterial diseases, unspecified**

Certain staphylococcal or streptococcal diseases (1B40-1B5Z)

**Coded Elsewhere:** Toxic shock syndrome (1C45)

Streptococcal tonsillitis (CA03.0)

Rheumatic myocarditis (BC42.3)

Chronic rheumatic pericarditis (BB21)

Acute staphylococcal tonsillitis (CA03.Y)

Acute rheumatic fever (1B40-1B42)

A disease of the connective tissue, caused by an infection with the gram-positive bacteria Streptococcus pyogenes (the disease may also affect the heart, joints, central nervous system, subcutaneous tissues, or skin). This disease is characterised by fever, polyarthritis, carditis, subcutaneous nodules, or erythema marginatum. Transmission is through haematogenous spread to other parts of the body after direct or indirect contact. Confirmation is by electrocardiography, sedimentation rate, or identification of Streptococcus pyogenes in a blood sample.

**Coded Elsewhere:** Erythema marginatum rheumaticum (EA50.0)

**1B40**

**Acute rheumatic fever without mention of heart involvement**

**1B40.0**

**Rheumatic arthritis, acute or subacute**

**1B40.Y**

**Other specified acute rheumatic fever without mention of heart involvement**

**1B40.Z**

**Acute rheumatic fever without mention of heart involvement, unspecified**

**1B41**

### **Acute rheumatic fever with heart involvement**

A disease of the cardiovascular system, caused as a result of rheumatic fever. Rheumatic heart disease is characterised by repeated inflammation with fibrinous repair. This disease may present with cardinal anatomic changes of the valve including leaflet thickening, commissural fusion, and shortening and thickening of the tendinous cords. Inflammation and valve scarring may also occur. Confirmation is by a thoracic radiography or echocardiography.

- Exclusions:**
- Rheumatic mitral valve stenosis (BB60.0)
  - Rheumatic mitral valve insufficiency (BB61.0)
  - Rheumatic mitral valve prolapse (BB62.0)
  - Rheumatic mitral stenosis with insufficiency (BB63.0)
  - Rheumatic aortic valve stenosis (BB70.0)
  - Rheumatic aortic valve insufficiency (BB71.0)
  - Rheumatic aortic stenosis with insufficiency (BB72.0)
  - Rheumatic tricuspid valve stenosis (BB80.0)
  - Rheumatic tricuspid valve insufficiency (BB81.0)
  - Rheumatic tricuspid valve stenosis with insufficiency (BB82.0)
  - Rheumatic pulmonary valve stenosis (BB90.0)
  - Rheumatic pulmonary valve insufficiency (BB91.0)
  - Rheumatic pulmonary valve stenosis with insufficiency (BB92.0)

**1B41.0**

### **Acute rheumatic pericarditis**

A disease of the pericardium, caused by acute rheumatic fever. This disease is characterised by fever, dry cough, rapid heart rate, fatigue, or low blood pressure. Confirmation is by echocardiography, or thoracic radiography.

**1B41.1**

### **Acute rheumatic endocarditis**

A disease of the endocardium, caused as a result of acute rheumatic fever. This disease is characterised by a high fever, chills, shortness of breath, rapid or irregular heartbeat, coughing up of blood, abdominal pain or septicaemia. This disease commonly presents with valvular involvement. Confirmation is by echocardiography.

**1B41.10**

Rheumatic aortitis

**1B41.1Y**

Other specified acute rheumatic endocarditis

**1B41.1Z**

Acute rheumatic endocarditis, unspecified

**1B41.2**

### **Acute rheumatic myocarditis**

Acute rheumatic myocarditis is cardiac inflammation associated with acute rheumatic fever triggered by an autoimmune reaction to group A streptococci infection resulting in pancarditis involving inflammation of the myocardium, endocardium, and epicardium, usually with left-sided valvar involvement.

**1B41.Y**

### **Other acute rheumatic heart disease**

**1B41.Z      Acute rheumatic heart disease, unspecified**

**1B42      Rheumatic chorea**

***Exclusions:***      Huntington chorea (8A01.10)

**1B50      Scarlet fever**

A disease caused by an infection with the gram-positive bacteria Streptococcus pyogenes. This disease is characterised by a sore throat, fever, and a red rash. Transmission is commonly by inhalation of infected respiratory secretions, direct skin contact, or indirect contact.

***Inclusions:***      Scarlatina NOS

***Exclusions:***      streptococcal sore throat (1B51)

Staphylococcal scarlatina (EA50.3)

**1B51      Streptococcal pharyngitis**

A disease of the pharynx, caused by an infection with the gram-positive bacteria Streptococcus pyogenes. This disease is characterised by fever, sore throat, tonsillar exudates, or large cervical lymph nodes. Transmission is commonly by inhalation of infected respiratory secretions, or indirect contact. Confirmation is by identification of Streptococcus pyogenes from a throat swab.

***Inclusions:***      Streptococcal sore throat

***Exclusions:***      Scarlet fever (1B50)

**1B53      Meningitis due to Streptococcus**

A disease of the meninges, caused by an infection with the gram-positive bacteria genus Streptococcus. This disease commonly presents with nausea, vomiting, photophobia, and confusion. Transmission is through haematogenous spread to the meninges after inhalation of infected respiratory secretions. Confirmation is by identification of Streptococcus in the cerebrospinal fluid.

***Inclusions:***      Streptococcal meningitis

**1B54      Meningitis due to Staphylococcus**

A disease of the meninges, caused by an infection with the gram-positive bacteria genus Staphylococcus. This disease commonly presents with acute inflammation of the meninges causing headache, fever, stiff neck, or neurological deficits. Confirmation is by identification of Staphylococcus in the cerebrospinal fluid.

***Inclusions:***      Staphylococcal meningitis

**1B5Y      Other specified staphylococcal or streptococcal diseases**

**1B5Z      Staphylococcal or streptococcal diseases, unspecified**

## Pyogenic bacterial infections of the skin or subcutaneous tissues (1B70-1B7Z)

**Coded Elsewhere:** Acute bacterial paronychia (EE12.0)

**1B70**

### **Bacterial cellulitis, erysipelas or lymphangitis**

Diffuse, spreading infections of skin and soft tissues by a range of bacterial organisms, most commonly beta-haemolytic streptococci and *Staphylococcus aureus*. The clinical presentation is dependent not only on the organism but also on the manner in which it invades the tissues.

**Exclusions:** Eosinophilic cellulitis (EB30)

**1B70.0**

#### **Erysipelas**

**Exclusions:** postpartum or puerperal erysipelas (JB40)

**1B70.00**

Erysipelas of face

**1B70.01**

Erysipelas of external ear

A rapidly expanding diffuse superficial dermal streptococcal infection involving the external ear. In contrast with infective otitis externa, the skin of the auricle is often initially healthy except at a point of entry for beta-haemolytic streptococci (commonly at a fissure behind the ear or where the ear lobe is attached to the side of the head) and systemic features including fever and malaise are common.

**1B70.02**

Erysipelas of lower limb

**1B70.0Y**

Erysipelas of other specified site

**1B70.0Z**

Erysipelas, unspecified

**1B70.1**

### **Streptococcal cellulitis of skin**

**Exclusions:** Orbital cellulitis (9A21.0)

Cellulitis of external ear (AA01)

anal cellulitis (DB70.00)

vulvar cellulitis (GA00.0)

Cellulitis of penis (GB06)

Inflammatory disorders of scrotum (GB07.2)

perirectal cellulitis (DB36.10)

Superficial incisional site infection (NE81.20)

**1B70.2**

### **Staphylococcal cellulitis of skin**

**Exclusions:** Orbital cellulitis (9A21.0)

Cellulitis of external ear (AA01)

anal cellulitis (DB70.00)

vulvar cellulitis (GA00.0)

Cellulitis of penis (GB06)

Inflammatory disorders of scrotum (GB07.2)

perirectal cellulitis (DB36.10)

Superficial incisional site infection (NE81.20)

- 1B70.3 Ascending bacterial lymphangitis**  
A complication of a focal acute pyogenic bacterial infection in which the draining lymphatics become red, inflamed and tender as the result of ascending infection. It is most commonly caused by *Streptococcus pyogenes*.
- 1B70.Y Bacterial cellulitis or lymphangitis due to other specified bacterium**
- 1B70.Z Bacterial cellulitis or lymphangitis due to unspecified bacterium**
- 1B71 Necrotising fasciitis**
- 1B71.0 Streptococcal necrotising fasciitis**  
**Exclusions:** Neonatal necrotising fasciitis (1B71.2)  
**Coded Elsewhere:** Neonatal streptococcal necrotising fasciitis (1B71.2)
- 1B71.1 Polymicrobial necrotising fasciitis**  
**Exclusions:** Neonatal necrotising fasciitis (1B71.2)
- 1B71.2 Neonatal necrotising fasciitis**  
Neonatal necrotising fasciitis is a life-threatening acute necrotising infection of fascia, subcutaneous tissues, and overlying skin similar to the condition seen in adults. It is rare in neonates but, in contrast to the adult form, tends to affect otherwise healthy babies. It has followed omphalitis, mastitis and postoperative wound infection, though preceding sites of infection are not always found. It has more commonly been associated with *Staphylococcus aureus* than with streptococcal infection. Gram-negative organisms have also been implicated. It may cause extensive tissue destruction and mortality is high.
- 1B71.Y Necrotising fasciitis due to other specified bacterial infection**
- 1B71.Z Necrotising fasciitis, unspecified**
- 1B72 Impetigo**  
A condition of the skin, commonly caused by a secondary infection with the gram-positive bacteria *Staphylococcus aureus* or group A beta haemolytic streptococci. This condition is characterised by bullous or non-bullous symptoms. Transmission is by direct contact with an infected individual. Confirmation is by identification of the infectious agent in a skin sample.  
**Exclusions:** impetigo herpetiformis (EA90.40)  
Staphylococcal scalded skin syndrome (EA50.2)  
**Coded Elsewhere:** Otitis externa in impetigo (AA3Y)

- 1B72.0** **Bullous impetigo**  
Bullous impetigo is a contagious superficial infection of the skin caused by certain strains of *Staphylococcus aureus* which release toxins into the local environment which are capable of cleaving desmoglein I, a protein involved in intercellular adhesion of epidermal keratinocytes. In contrast to the very superficial, rapidly shed and rarely observed blisters of non-bullous impetigo, the bullae of bullous impetigo are tense and well demarcated, sometimes reaching several centimetres in diameter before rupture.
- Coded Elsewhere:** Neonatal bullous impetigo (EH11)
- 1B72.1** **Non-bullous impetigo**  
Non-bullous impetigo is due to superficial skin infection with either *Streptococcus pyogenes* or *Staphylococcus aureus* or both. The very superficial blisters which form in the upper epidermis are soon shed and rarely seen (cf. bullous impetigo) so that it normally presents with areas of superficial oozing and crusting on the skin surface. It often follows minor skin injury or on skin damaged by a preexisting dermatosis such as atopic eczema or scabies.
- 1B72.2** **Secondary impetiginisation of the skin**  
Secondary infection of dermatoses such as atopic eczema by streptococci or staphylococci.
- Coding Note:** Code also the causing condition
- 1B72.Y** **Other specified impetigo**
- 1B72.Z** **Impetigo, unspecified**
- 1B73** **Ecthyma**  
Ecthyma is a superficial ulcerative bacterial pyoderma. It is characterised by small, purulent, shallow, punched-out ulcers with thick, brown-black crusts and surrounding erythema. The commonest form is caused by beta-haemolytic streptococci, often in association with *Staphylococcus aureus*. It is associated with poor hygiene and malnutrition. Ecthyma gangrenosum is an uncommon severe variant caused by *Pseudomonas aeruginosa*.
- 1B73.0** **Streptococcal ecthyma**
- 1B73.1** **Staphylococcal ecthyma**  
Ecthyma due to a monoinfection with *Staphylococcus aureus*. It is less common than streptococcal ecthyma.
- 1B73.2** **Ecthyma gangrenosum**  
Ecthyma gangrenosum is a potentially life-threatening infection of skin in patients who are immunocompromised through disease or immunosuppressive therapy. It is most commonly caused by *Pseudomonas aeruginosa* though a variety of other organisms may be implicated. It is characterised by usually painless erythematous macules or plaques which progress to haemorrhagic blistering and necrosis of the skin. Lesions may be multiple and widely disseminated, though the anogenital area is a common site. *Pseudomonas* can frequently be cultured from the blood.
- Coded Elsewhere:** Neonatal ecthyma gangrenosum (EH11)

- 1B73.Y**      **Other specified ecthyma**
- 1B73.Z**      **Ecthyma, unspecified**
- 1B74**      **Superficial bacterial folliculitis**  
Bacterial infection of the follicular ostium manifested as follicular papules and pustules with perifollicular erythema. The most commonly isolated organisms are coagulase-negative staphylococci and *Staphylococcus aureus*. The infection may be acute but is more commonly subacute or chronic; individual lesions heal without scarring. Commonly affected sites include the scalp, beard area, thighs and buttocks.
- 1B74.0**      ***Staphylococcus aureus* superficial folliculitis**  
Infection of the follicular ostium with *Staphylococcus aureus*. There is a predilection for hairy areas including the scalp, beard and thighs.
- 1B74.Y**      **Superficial bacterial folliculitis due to other specified organism**
- 1B74.Z**      **Superficial bacterial folliculitis due to unspecified organism**
- 1B75**      **Deep bacterial folliculitis or pyogenic abscess of the skin**  
Single or multiple focal infections of skin and soft tissues most commonly centred on the hair follicle and most commonly due to *Staphylococcus aureus*. Pyogenic abscesses may develop in other locations in skin which has been injured as a result of either trauma or surgery.
- 1B75.0**      **Furuncle**  
A localised infection of a hair follicle by *Staphylococcus aureus*. It manifests as a painful swollen purulent mass centred on a hair follicle.
- 1B75.1**      **Carbuncle**  
A deep follicular pyogenic staphylococcal skin infection involving a group of adjacent hair follicles. It manifests as a painful boggy mass containing multiple purulent discharging sinuses.
- 1B75.2**      **Furunculosis**  
The presence of multiple furuncles, this condition is associated with disorders such as malnutrition and diabetes mellitus. Treatment-resistant furunculosis may be associated with Panton-Valentine leucocidin-producing *Staphylococcus aureus*.
- 1B75.3**      **Pyogenic abscess of the skin**  
A pus-producing abscess of the skin most commonly due to bacterial infection by *Staphylococcus aureus*. It is prone to develop where the normal anatomy is disturbed as in pilonidal disease, an epidermoid cyst or around foreign bodies such as surgical sutures.
- Coded Elsewhere:** Sacrococcygeal pilonidal abscess (EG63.2)  
Infected epidermoid cyst (EK70.00)

<b>1B75.4</b>	<b>Chronic deep bacterial folliculitis</b> A chronic pyogenic infection by <i>Staphylococcus aureus</i> involving the whole depth of the hair follicle. Sycosis occurs mostly in males after puberty, and commonly involves the follicles of the beard. Most cases begin in the third or fourth decade. Unknown host factors appear to be important in the chronicity of the infection. Extensive follicular destruction and scarring may ensue (lupoid sycosis).
	<b>Coded Elsewhere:</b> Folliculitis cruris pustulosa atrophicans (ED81.0)
<b>1B75.Z</b>	<b>Deep bacterial folliculitis or pyogenic abscess of the skin, unspecified</b>
<b>1B7Y</b>	<b>Other specified pyogenic bacterial infection of skin or subcutaneous tissue</b>
<b>1B7Z</b>	<b>Pyogenic bacterial infection of skin or subcutaneous tissue, unspecified</b>

### Certain zoonotic bacterial diseases (1B90-1B9Z)

This is a group of bacterial diseases that are transmitted to humans by contact with infected vertebrate animals.

<b>1B90</b>	<b>Rat-bite fevers</b> Any disease caused by an infection with the gram-negative bacteria <i>Streptobacillus moniliformis</i> or gram-negative bacteria <i>Spirillum minus</i> . This disease presents with symptoms depending on the bacterial agent. Transmission is through the bite of an infected rat or rodent.
<b>1B90.0</b>	<b>Spirillosis</b> A disease caused by an infection with the gram-negative bacteria <i>Spirillum minus</i> . This disease is initially characterised by local inflammation, followed by fever, lymphadenitis, and headache. Transmission is commonly by direct contact through the bite or scratch of an infected rat. Confirmation is by identification of <i>Spirillum</i> in blood or tissue samples.  <b>Inclusions:</b> Sodoku
<b>1B90.1</b>	<b>Streptobacillosis</b> A disease caused by an infection with the gram-negative bacteria <i>Streptobacillus moniliformis</i> . This disease is characterised by systemic illness with fever, chills, rash, and polyarthralgias. Transmission is commonly by direct contact through the bite or scratch of an infected rat. Confirmation is by identification of <i>Streptobacillus</i> in blood or joint samples.  <b>Inclusions:</b> Epidemic arthritic erythema Haverhill fever Streptobacillary rat-bite fever

**1B91**

### **Leptospirosis**

A disease caused by an infection with the gram-negative bacteria Leptospira. In the first phase, this disease is characterised by generalised illness (fever, chills, or myalgias) or individuals may be asymptomatic; in the second phase, the heart, liver, kidneys, or brain may be affected by the infection (symptoms are dependent on the site affected). Transmission is by ingestion of contaminated food or water, droplet transmission, or direct cutaneous contact. Confirmation is by identification of Leptospira in samples from the affected individual.

**1B92**

### **Glanders**

A disease caused by an infection with the gram-negative bacteria Burkholderia mallei. This disease presents with symptoms depending on the route of infection. Transmission is by contact with tissues or body fluids from infected animals (typically horses), or inhalation of infected aerosol. Confirmation is by identification of Burkholderia mallei in blood, sputum, urine, or skin samples.

**Inclusions:** Infection due to Pseudomonas mallei

**1B93**

### **Plague**

A disease caused by an infection with the gram-negative bacteria Yersinia pestis. This disease presents with symptoms depending on the site of infection, and may be fatal. Transmission is through the bite of an infected flea, by direct contact, or by droplet transmission.

**1B93.0**

#### **Bubonic plague**

A disease caused by an infection with the gram-negative bacteria Yersinia pestis. This disease commonly presents with an infection of the lymph nodes leading to swelling and pain. This disease may also present with gangrene of the extremities, chills, malaise, high fever, muscle cramps, or seizures. Transmission is through the bite of an infected flea, by direct contact, or by droplet transmission.

**1B93.1**

#### **Cellulocutaneous plague**

Cellulocutaneous plague is a zoonotic disease caused by Yersinia pestis (formerly known as Pasteurella pestis) involving the skin around the flea bite which transmitted the pathogen.

**1B93.2**

#### **Pneumonic plague**

Pneumonic plague is a zoonotic disease caused by Yersinia pestis (formerly known as Pasteurella pestis) involving the lung. The lungs are seeded by hematogenous spread or from inhalation of the pathogen.

**1B93.3**

#### **Plague meningitis**

Plague meningitis is a zoonotic disease caused by Yersinia pestis (formerly known as Pasteurella pestis) that involves the central nervous system.

**1B93.Y**

#### **Other specified plague**

**1B93.Z**

#### **Plague, unspecified**

**1B94**

### **Tularaemia**

A disease caused by an infection with *Francisella tularensis*. This disease is characterised by fever, chills, headache, and weakness, as well as other symptoms depending on the route of infection. Transmission is through the bite of an infected tick or deer fly, by ingestion of contaminated water or food, airborne transmission, or by direct contact with infected animals. Confirmation is by identification of *Francisella tularensis*, or the presence of antibodies to *Francisella tularensis*, in a blood or sputum sample.

**Inclusions:**

- deer-fly fever
- rabbit fever
- infection due to *Francisella tularensis*

**1B94.0**

### **Ulceroglandular tularaemia**

**1B94.Y**

### **Other specified tularaemia**

**1B94.Z**

### **Tularaemia, unspecified**

**1B95**

### **Brucellosis**

A disease caused by an infection with the gram-negative bacteria *Brucella*. This disease is characterised by fever, muscular pain, or sweating. Transmission is by ingestion of unpasteurized milk and soft cheeses made from infected animals. Confirmation is by identification of *Brucella* or antibodies to *Brucella*.

**Inclusions:**

- Malta fever
- Mediterranean fever
- undulant fever

**Coded Elsewhere:** Spondylitis in brucellosis (FA13)

**1B96**

### **Erysipeloid**

A disease caused by an infection with the gram-positive bacteria *Erysipelothrix rhusiopathiae*. This disease is characterised by localised cellulitis. Transmission is by direct cutaneous contact with *Erysipelothrix rhusiopathiae*, often in individuals handling seafood and raw meat.

**1B97**

### **Anthrax**

A disease caused by an infection with the gram-positive bacteria *Bacillus anthracis*. This disease presents with clinical signs depending on the route of infection. Transmission is by inhalation, ingestion, or cutaneous contact with *Bacillus anthracis* spores. Confirmation is by identification of *Bacillus anthracis* in a sample, or detection of antibodies or toxins.

**1B98**

### **Cat-scratch disease**

A disease commonly caused by an infection with the gram-negative bacteria *Bartonella henselae*. This disease is characterised by regional lymphadenopathy, or fever. Transmission is commonly from the scratch or bite of a cat infested with fleas infected with *Bartonella henselae*.

**Inclusions:**

- Cat-scratch fever
- Rochalimaea henselae* infection

**1B99**

### **Pasteurellosis**

A disease caused by an infection with the gram-negative bacteria Pasteurella. This disease is characterised by local cellulitis and may lead to other clinical signs depending on the route of infection. Transmission is commonly by direct contact through the bite, scratch, or lick from an infected animal, inhalation of infected respiratory secretions, or ingestion of contaminated meat. Confirmation is by identification of Pasteurella from the affected individual.

**1B9A**

### **Extraintestinal yersiniosis**

A disease caused by an infection with the gram-negative bacteria Yersinia enterocolitica, excluding infections in the intestinal tract. This disease presents with symptoms depending on the site of infection, and may lead to a systemic infection. Transmission is by the faecal-oral route from the ingestion of contaminated food or water, or direct contact with infected animals or humans. Confirmation is by identification of Yersinia enterocolitica from affected tissues.

**Exclusions:** Enteritis due to Yersinia enterocolitica (1A05)  
Plague (1B93)

**1B9Z**

### **Unspecified zoonotic bacterial disease**

## **Other bacterial diseases (1C10-1C4Z)**

**Coded Elsewhere:** Other bacterial infections of the fetus or newborn (KA61)

Bacterial duodenitis (DA51.6Y)

**1C10**

### **Actinomycosis**

A disease commonly caused by an infection with the gram-positive bacteria Actinomyces. This disease is characterised by painful abscesses in the mouth, lungs, and gastrointestinal tract. Actinomycosis is an endogenous infection whose causative bacteria originate from the patient's oral and pharyngeal flora. It can spread by continuity and hematogenously. Confirmation is by identification of Actinomyces in infected tissue or fluid samples.

**Exclusions:** Actinomycetoma (1C43)

**1C10.0**

### **Pulmonary actinomycosis**

This is a pulmonary infectious bacterial disease caused by Actinomyces species such as *Actinomyces israelii* or *A. gerencseriae*. It can also be caused by *Propionibacterium propionicus*, and the condition is likely to be polymicrobial aerobic-anaerobic infection.

**1C10.1**

### **Abdominal actinomycosis**

This is a cervicofacial infectious bacterial disease caused by Actinomyces species such as *Actinomyces israelii* or *A. gerencseriae*. It can also be caused by *Propionibacterium propionicus*, and the condition is likely to be polymicrobial aerobic anaerobic infection.

<b>1C10.2</b>	<b>Cervicofacial actinomycosis</b> Cervicofacial actinomycosis is the commonest clinical form of actinomycosis, a sporadically occurring endogenous polymicrobial inflammatory process in which fermentative actinomycetes of the genera <i>Actinomyces</i> (especially <i>A. israelii</i> and <i>A. gerencseriae</i> ), <i>Propionibacterium</i> and <i>Bifidobacterium</i> act as the principal pathogens. The typical presentation is a slowly progressive development from painless tissue infiltration and induration of soft tissues of the face and neck to multiple abscesses and draining sinus tracts discharging pus. Actinomycosis is a major factor and indicator of poor prognosis in infected osteoradionecrosis of the jaws following radiation therapy for head and neck cancer.
<b>1C10.3</b>	<b>Primary cutaneous actinomycosis</b>
<b>1C10.Y</b>	<b>Other specified forms of actinomycosis</b>
<b>1C10.Z</b>	<b>Actinomycosis, unspecified</b>
<b>1C11</b>	<p><b>Bartonellosis</b> Any infection caused by the gram-negative bacteria <i>Bartonella</i>. <b>Coded Elsewhere:</b> Cat-scratch disease (1B98)</p>
<b>1C11.0</b>	<b>Carrion disease</b> Infection by <i>Bartonella bacilliformis</i> which can present as a systemic illness, Oroya fever, or as a benign skin eruption, verruga peruana.
<b>1C11.00</b>	Oroya fever A disease commonly caused by an infection with the gram-negative bacteria <i>Bartonella bacilliformis</i> . This disease is characterised by severe haemolytic anaemia and transient immunosuppression. This disease may present with fever, malaise, or jaundice. Transmission is through the bite of infected sandflies from the genus <i>Lutzomyia</i> . Confirmation is by identification of <i>Bartonella bacilliformis</i> in a blood sample.
<b>1C11.01</b>	Verruga peruana A disease caused by an infection with the gram-negative bacteria <i>Bartonella bacilliformis</i> . This disease is characterised by multiple nodular and red-to-purple vascular skin lesions, subsequent to Oroya fever. Transmission is through the bite of infected sandflies from the genus <i>Lutzomyia</i> .
<b>1C11.1</b>	<b>Trench fever</b> A disease caused by an infection with the gram-negative bacteria <i>Bartonella quintana</i> . This disease is characterised by fever, headache, rash, bone pain, or may be asymptomatic. Transmission is through the bite of infected body lice. Confirmation is by identification of <i>Bartonella quintana</i> in a blood sample. <i>Bartonella quintana</i> was formerly known as <i>Rickettsia quintana</i> . <b>Inclusions:</b> Quintan fever
<b>1C11.Y</b>	<b>Other forms of bartonellosis</b>
<b>1C11.Z</b>	<b>Bartonellosis, unspecified</b>

**1C12****Whooping cough**

A disease of the upper respiratory tract, caused by an infection with the gram-negative bacteria *Bordetella*. This disease typically presents with paroxysmal cough, inspiratory whoop, and fainting or vomiting after coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of *Bordetella* from nasopharyngeal samples or sputum, or detection of antibodies against *Bordetella*.

**1C12.0****Whooping cough due to *Bordetella pertussis***

A disease of the upper respiratory tract, caused by an infection of the gram-negative bacteria *Bordetella pertussis*. This disease typically presents with paroxysmal cough, inspiratory whoop, and fainting or vomiting after coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of *Bordetella pertussis* from nasopharyngeal samples or sputum, or detection of antibodies against *Bordetella pertussis*.

**1C12.1****Whooping cough due to *Bordetella parapertussis***

A disease of the upper respiratory tract, caused by an infection of the gram-negative bacteria *Bordetella parapertussis*. This disease typically presents with a mild clinical presentation of paroxysmal cough, inspiratory whoop, and fainting or vomiting after coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of *Bordetella parapertussis* from nasopharyngeal samples or sputum, or detection of antibodies against *Bordetella parapertussis*.

**1C12.Y****Other specified whooping cough****1C12.Z****Whooping cough, unspecified****1C13****Tetanus**

A disease of the skeletal muscle fibres, caused by an infection with the gram-positive bacteria *Clostridium tetani*. This disease is characterised by muscle spasms. Transmission is by direct contact of an open wound.

**Exclusions:**      Obstetrical tetanus (1C14)

                          Tetanus neonatorum (1C15)

**1C14****Obstetrical tetanus**

A disease caused by an infection with the gram-positive bacteria *Clostridium tetani*. This disease is characterised by a prolonged contraction of skeletal muscle fibres during pregnancy or within six weeks of termination of pregnancy. Transmission is by direct contact.

**1C15****Tetanus neonatorum**

A disease affecting neonates, caused by an infection with the gram-positive bacteria *Clostridium tetani*. This disease is characterised by systemic muscle spasms that arise within the first few days after delivery. Transmission is commonly by direct contact or lack of maternal immunity.

**1C16****Gas gangrene**

Gas gangrene or clostridial myonecrosis is a potentially fatal, rapidly progressive necrotizing infection of muscle and soft tissue resulting from bacterial invasion of healthy muscle from adjacent traumatized muscle or soft tissue. The infection originates in a wound contaminated with bacteria of the genus Clostridium. *C. perfringens* accounts for the majority of cases (over eighty percent), while *C. novyi*, *C. septicum*, and *C. histolyticum* cause most of the other cases.

**1C17****Diphtheria**

A disease commonly of the respiratory system, caused by an infection of the gram-positive bacteria *Corynebacterium diphtheriae*. This disease is characterised by sore throat, fever, and a pseudomembrane on the tonsils, pharynx, or nasal cavity. Transmission is by inhalation of infected respiratory secretions, or direct cutaneous contact. Confirmation is by identification of *Corynebacterium diphtheriae* from a throat swab or infected tissue, and by clinical signs.

**1C17.0****Pharyngeal or tonsillar diphtheria**

**Inclusions:** Diphtheritic membranous angina

**1C17.00**

Postdiphtheritic paralysis of uvula

**1C17.0Y**

Other specified pharyngeal or tonsillar diphtheria

**1C17.0Z**

Pharyngeal or tonsillar diphtheria, unspecified

**1C17.1****Nasal diphtheria****1C17.2****Laryngeal diphtheria**

localised infection of mucous membranes of the larynx caused by toxigenic strains of *Corynebacterium diphtheriae*; it is characterised by the presence of a pseudomembrane at the site of infection; diphtheria toxin, produced by *C. diphtheriae*, can cause myocarditis, polyneuritis, and other systemic toxic effects.

**Inclusions:** Diphtheritic laryngotracheitis

**1C17.3****Cutaneous diphtheria**

**Exclusions:** Erythrasma (1C44)

**1C17.Y**

Other specified diphtheria

**1C17.Z**

Diphtheria, unspecified

**1C18****Brazilian purpuric fever**

A disease affecting children, caused by an infection with the gram-negative bacteria *Haemophilus aegyptius*. This disease is characterised by fever, nausea, vomiting, purpuric lesions, and sepsis, that is preceded by conjunctivitis. Transmission may be by mechanical transmission from infected eye gnats, contact with discharge from infected individuals, or fomites used near the eyes. Confirmation is by identification of *Haemophilus influenzae* from blood.

**Inclusions:** Systemic *Haemophilus aegyptius* infection

**1C19**

### **Legionellosis**

Legionellosis varies in severity from a mild febrile illness to a serious and sometimes fatal form of pneumonia and is caused by exposure to Legionella species found in water, and potting mixes.

Legionellosis is a generic term describing the pneumonic and non-pneumonic forms of infection with Legionella.

**1C19.0**

### **Nonpneumonic Legionnaires' disease**

The non-pneumonic form (Pontiac fever) is an acute, self-limiting flu-like illness usually lasting 2–5 days. The incubation period is from a few and up to 48 hours. The main symptoms are fever, chills, headache, malaise and muscle pain (myalgia).

**1C19.1**

### **Legionnaires' disease**

Legionnaires' disease, the pneumonic form, has an incubation period of 2 to 10 days (but up to 16 days has been recorded in some outbreaks). Initially, symptoms are fever, loss of appetite, headache, malaise and lethargy. Some patients may also have muscle pain, diarrhoea and confusion. There is also usually an initial mild cough, but as many as 50% of patients can present phlegm. Blood-streaked phlegm or hemoptysis occurs in about one-third of the patients. The severity of disease ranges from a mild cough to a rapidly fatal pneumonia. Death occurs through progressive pneumonia with respiratory failure and/or shock and multi-organ failure.

**1C19.Z**

### **Legionellosis, unspecified**

**1C1A**

### **Listeriosis**

A disease caused by an infection with the gram-positive bacteria Listeria. This disease commonly presents with fever and muscle aches, followed by gastrointestinal symptoms.

**Inclusions:** listerial foodborne infection

**Coded Elsewhere:** Neonatal listeriosis (KA61.1)

**1C1A.0**

### **Cutaneous listeriosis**

This is a bacterial infection caused by a Gram-positive, motile bacterium, Listeria monocytogenes. Listeriosis occurs primarily in newborn infants, elderly patients, and patients who are immunocompromised.

**1C1A.1**

### **Listerial meningitis or meningoencephalitis**

A disease of the meninges or brain, caused by an infection with the gram-positive bacteria Listeria. This disease is characterised by fever, headache, or neurological deficits. Transmission is through haematogenous spread to the meninges from ingestion of contaminated food. Confirmation is by identification of Listeria from cerebrospinal fluid.

**1C1A.Y**

### **Other specified listeriosis**

**1C1A.Z**

### **Listeriosis, unspecified**

**1C1B****Nocardiosis**

A disease caused by an infection with the gram-positive bacteria Nocardia. This disease presents with symptoms depending on the site of infection (commonly lung, brain, or skin). Transmission is by inhalation of Nocardia from soil or water, or by direct cutaneous contact. Confirmation is by identification of Nocardia in samples from affected sites.

**1C1B.0****Pulmonary nocardiosis**

A disease of the respiratory system, caused by an infection with the gram-positive bacteria Nocardia. This disease is characterised by chest pain, haemoptysis, fever, weight loss, and cough. Transmission is by inhalation of Nocardia from soil or water. Confirmation is by identification of Nocardia in sputum samples, or lung biopsy.

**1C1B.1****Cutaneous nocardiosis**

Cutaneous nocardiosis may be due to direct infection of the skin where it presents either as a solitary cold abscess or as a lymphangitic process in which infection spreads up lymphatic channels to form a linear array of suppurative nodules. Skin involvement is also present in a third of cases of systemic nocardiosis.

***Inclusions:***      Actinomycetoma due to Nocardia species (1C43)

**1C1B.Y****Other specified forms of nocardiosis****1C1B.Z****Nocardiosis, unspecified****1C1C****Meningococcal disease**

This illness is severe and includes infections of the lining of the brain and spinal cord (meningitis) and generalised bloodstream infections (bacteraemia or septicaemia).

Meningococcus bacteria are spread through the exchange of respiratory and throat secretions like spit (e.g., by living in close quarters, kissing). Meningococcal disease can be treated with antibiotics, but quick medical attention is extremely important. Keeping up to date with recommended vaccines is the best defence against meningococcal disease.

***Inclusions:***      Meningococcal infection

**1C1C.0****Meningococcal meningitis**

A condition of the meninges, caused by an infection with the gram-negative bacteria Neisseria meningitidis. This condition is characterised by high fever, stiff neck, severe headache, vomiting, purpura, photophobia, and sometimes chills, altered mental status, or seizures. Transmission is through haematogenous spread to the meninges after droplet transmission or direct contact. Confirmation is by identification of Neisseria meningitidis in CSF (cerebrospinal fluid), for example, by agglutination test or polymerase chain reaction.

***Inclusions:***      Meningitis due to Neisseria meningitidis

<b>1C1C.1</b>	<b>Waterhouse-Friderichsen syndrome</b> A syndrome characterised by adrenal insufficiency due to bleeding into the adrenal glands (mostly bilateral but sometimes also unilateral) due to the severe infection, commonly caused by an infection with meningococcus ( <i>Neisseria meningitidis</i> ). However, it can also be caused by infections with other bacteria such as <i>Streptococcus pneumoniae</i> or <i>Haemophilus influenzae</i> or even due to some severe viral infections.  This syndrome may present with fever, chills, vomiting, myalgia, or rash, with progression to disseminated intravascular coagulation. Transmission of the underlying infections is by direct contact or droplet transmission.  <i>Inclusions:</i> meningococcal haemorrhagic adrenalitis
<b>1C1C.2</b>	<b>Meningococcaemia</b> A condition caused by an infection with the gram-negative bacteria <i>Neisseria meningitidis</i> that leads to a severe systemic inflammatory response. This condition is characterised by fever, rash, and myalgia. Transmission is by direct contact or droplet transmission. Confirmation is by identification of <i>Neisseria meningitidis</i> in blood samples.
<b>1C1C.20</b>	Acute meningococcaemia A condition caused by an infection with the gram-negative bacteria <i>Neisseria meningitidis</i> that leads to a severe systemic inflammatory response. This condition is characterised by fever, chills, myalgia, nausea, or petechial rash, with progression to shock and disseminated intravascular coagulation. Transmission is by direct contact or droplet transmission. Confirmation is by identification of <i>Neisseria meningitidis</i> in blood samples.
<b>1C1C.2Y</b>	Other specified meningococcaemia
<b>1C1C.2Z</b>	Meningococcaemia, unspecified
<b>1C1C.Y</b>	<b>Other specified meningococcal disease</b>
<b>1C1C.Z</b>	<b>Meningococcal disease, unspecified</b>
<b>1C1D</b>	<b>Yaws</b> An infectious disease caused by <i>Treponema pallidum</i> subsp. <i>pertenue</i> which mainly affects children in rural communities in the humid tropics. It affects the skin and bones, is spread by skin to skin contact, and is not sexually transmitted, but cannot be distinguished serologically from syphilis.

<b>1C1D.0</b>	<b>Primary yaws</b> Primary yaws results from primary inoculation of <i>Treponema pallidum</i> subsp. <i>pertenue</i> into the skin, manifesting 2-12 weeks later as a localised papule (initial, primary or 'mother' yaw) before developing into a large non-tender ulcerating nodule, often resembling a raspberry (hence the name 'framboesia'). The primary lesion is most commonly located on the legs and ankles may also be found on the buttocks, arms, hands, and face. It usually heals after 3–6 months and is still present at the onset of the secondary stage in only a minority (9-15%).
	<b>Inclusions:</b> Chancre of yaws Primary framboesia
<b>1C1D.1</b>	<b>Secondary yaws</b> Secondary yaws results from lymphatic and haematogenous spread of <i>Treponema pallidum</i> subsp. <i>pertenue</i> spirochaetes from the initial inoculation site and appears from a few weeks to 2 years after the primary infection. The commonest initial symptoms are non-specific and include arthralgia and malaise. Secondary skin lesions consist of multiple papules and nodules similar to the initial lesion but smaller. They may be localised, regional or generalised; they may ulcerate and on moist areas may mimic syphilitic condylomata lata. Hyperkeratotic plaques on the palms and soles may develop painful fissures and secondary infection, resulting in a characteristic 'crab-like' gait.
<b>1C1D.2</b>	<b>Tertiary yaws</b> Tertiary yaws develops in <10% of untreated infected individuals after an interval of 5 years or more. The late stage skin lesions are characterised by gummatous nodules with necrotic tissue destruction, followed by debilitating scarring and contracture. Destructive osteitis can result in ulceration of the palate and nasopharynx ('gangosa'), or bowing of the tibia (sabre shins). Hypertrophic periostitis at periarticular sites can lead to exostosis of the paranasal maxillae ('goundou').
<b>1C1D.3</b>	<b>Latent yaws</b> Latent yaws is defined as yaws with no clinical signs and only serological evidence of infection (reactive treponemal and non-treponemal tests). Infectious relapses may occur in latent cases for up to 5 and, rarely, 10 years. The total duration of infectivity for an untreated yaws patient, including relapses, is thought to be about 12-18 months.
	<b>Inclusions:</b> Yaws without clinical manifestations, with positive serology
<b>1C1D.Z</b>	<b>Yaws, unspecified</b>
<b>1C1E</b>	<b>Pinta</b> A disease of the skin, caused by an infection with the gram-negative bacteria <i>Treponema pallidum</i> carateum. This disease is characterised by hyperkeratosis and hyperpigmentation. Transmission may be by direct contact.
<b>1C1E.0</b>	<b>Primary lesions of pinta</b> The primary stage of pinta is characterised by a sparse eruption of cutaneous papules and erythematous scaly plaques. This stage may last for months to years.
	<b>Inclusions:</b> Primary chancre of pinta

- 1C1E.1** **Intermediate lesions of pinta**  
The intermediate stage of pinta develops months to years after the primary stage and is characterised by more extensive lesions (known as pintids) which gradually change from pink to blue, black or grey and become atrophic.
- Inclusions:** Pintids
- 1C1E.2** **Late lesions of pinta**  
Late lesions of pinta are confined to the skin and are characterised by dyschromia and atrophy. They typically take between two and four years to develop following initial infection. The skin appears mottled and atrophic with numerous irregular and variegated hypermelanotic, hypomelanotic and amelanotic patches typically involving the wrists, palms, ankles, and elbows, as well as the skin around and within old lesions.
- Inclusions:** Hypomelanosis due to late pinta
- 1C1E.3** **Mixed lesions of pinta**
- 1C1E.Z** **Pinta, unspecified**
- 1C1F** **Endemic non-venereal syphilis**  
Endemic non-venereal syphilis is caused by *Treponema pallidum* subspecies *endemicum* and is transmitted by skin-to-skin or mouth-to-mouth contact rather than sexual contact. Children are at greatest risk of infection. Clinical features are similar to venereal syphilis with a primary ulcer (usually in the mouth or on the nipples of breast-feeding women nursing infected children) and, in the secondary stage, a generalised papular rash, oral mucous patches, condylomata lata and generalised lymphadenopathy. Late stage infection is characterised by destructive gummatous (gangosa), bones and skin.
- Inclusions:** Bejel  
Endemic syphilis  
Njovera
- 1C1G** **Lyme borreliosis**  
A tick-borne infection by the spirochaete *Borrelia burgdorferi*. Lyme borreliosis typically presents with a characteristic rash, erythema chronicum migrans, at an average of seven days after a bite from an infected tick. The rash may be accompanied by flu-like symptoms. Disseminated infection may cause meningitis, cranial neuropathies and carditis amongst other manifestations. Late disease, months to years after initial infection, may present with a pauciarticular arthritis or with encephalomyelitis.
- Coding Note:** Use additional code if desired, to identify any associated condition.  
Use additional code, if desired, to identify any sequelae. The extension code 'Cause of late effect' is used in addition to both codes to show the relationship between the causative condition and the resulting sequelae.
- 1C1G.0** **Early cutaneous Lyme borreliosis**  
*Borrelia burgdorferi* infection involving the skin, typically as erythema migrans, the commonest presentation of Lyme disease.
- Coding Note:** Use additional code if desired, to identify any associated condition.

<b>1C1G.1</b>	<b>Disseminated Lyme borreliosis</b>
<b>Coding Note:</b>	Use additional code if desired, to identify any associated condition.
<b>1C1G.10</b>	Lyme neuroborreliosis
<b>1C1G.11</b>	Lyme carditis
<b>1C1G.12</b>	Ophthalmic Lyme borreliosis
<b>1C1G.13</b>	Lyme arthritis
<b>1C1G.14</b>	Late cutaneous Lyme borreliosis
<b>1C1G.1Y</b>	Other specified disseminated Lyme borreliosis
<b>Coding Note:</b>	Use additional code if desired, to identify any associated condition.
<b>1C1G.1Z</b>	Disseminated Lyme borreliosis, unspecified
<b>Coding Note:</b>	Use additional code if desired, to identify any associated condition.
<b>1C1G.Y</b>	<b>Other specified Lyme borreliosis</b>
<b>Coding Note:</b>	Use additional code if desired, to identify any associated condition.
	Use additional code, if desired, to identify any sequelae. The extension code 'Cause of late effect' is used in addition to both codes to show the relationship between the causative condition and the resulting sequelae.
<b>1C1G.Z</b>	<b>Lyme borreliosis, unspecified</b>
<b>Coding Note:</b>	Use additional code if desired, to identify any associated condition.
	Use additional code, if desired, to identify any sequelae. The extension code 'Cause of late effect' is used in addition to both codes to show the relationship between the causative condition and the resulting sequelae.
<b>1C1H</b>	<b>Necrotising ulcerative gingivitis</b>
	Necrotising ulcerative gingivitis (NUG) is a condition affecting the gums that is caused by a bacterial infection. It is a form of periodontal (gum) disease. But unlike other forms, it typically develops quickly and causes moderate to severe pain. "Necrotising" means that the condition destroys tissue. "Ulcerative" refers to sores that can appear on the gums.
	<b>Inclusions:</b> Fusospirochaetal gangrene
<b>1C1H.0</b>	<b>Other Vincent infections</b>
<b>1C1H.Y</b>	<b>Other specified necrotising ulcerative gingivitis</b>
<b>1C1H.Z</b>	<b>Necrotising ulcerative gingivitis, unspecified</b>
<b>1C1J</b>	<b>Relapsing fever</b>

<b>1C1J.0</b>	<b>Tick-borne relapsing fever</b> A disease caused by an infection with the bacteria Borrelia. This disease is characterised by repeated episodes of fever, with the febrile episode lasting for approximately 3 days, followed by the afebrile state of approximately 7 days. Transmission is through the bite of an infected soft tick (from the genus <i>Ornithodoros</i> ). Confirmation is by identification of spirochete bacteria from a blood smear, bone marrow, or cerebrospinal fluid.  <b>Inclusions:</b> Relapsing fever due to any <i>Borrelia</i> species other than <i>Borrelia recurrentis</i>
<b>1C1J.1</b>	<b>Louse-borne relapsing fever</b> A spirochaetal infection caused by the human to human transmission of <i>Borrelia recurrentis</i> by the human body louse. Epidemics are associated with poor living conditions as may result from famine or war. Episodic fever may progress to severe jaundice, haemorrhage, confusion and death. Confirmation is by identification of <i>Borrelia</i> in blood films.  <b>Inclusions:</b> Relapsing fever due to <i>Borrelia recurrentis</i>
<b>1C1J.Z</b>	<b>Relapsing fever, unspecified</b>
Other diseases due to chlamydiae (1C20-1C2Z)	
<b>1C20</b>	<b>Chlamydial conjunctivitis</b> Chlamydial conjunctivitis is a sexually transmitted infection of conjunctiva caused by bacteria <i>Chlamydia trachomatis</i> . Bacteria can be passed from an infected mother to baby during vaginal childbirth. The symptoms include that one or both eyes will be red with a sticky discharge and swollen eyelids.  <b>Inclusions:</b> Paratrachoma
<b>1C21</b>	<b>Chlamydial peritonitis</b> This is a sexually transmitted infection that causes an inflammation of the peritoneum, the thin tissue that lines the inner wall of the abdomen and covers most of the abdominal organs.
<b>1C22</b>	<b>Infections due to Chlamydia psittaci</b> Any condition caused by an infection with the gram-negative bacteria <i>Chlamydia psittaci</i> . These conditions are characterised by variable clinical presentations such as fever, cough, headaches, chills, fatigue, nausea, vomiting, diarrhoea, or pneumonia. Transmission is commonly by inhalation of aerosol contaminated with body fluids from infected birds, or direct contact with infected birds. Confirmation is by identification of <i>Chlamydia psittaci</i> .  <b>Inclusions:</b> Psittacosis Ornithosis Parrot fever  <b>Coded Elsewhere:</b> Pneumonia in chlamydia psittaci infection (CA40.0Y)

**1C23****Trachoma**

A disease caused by an infection with the gram-negative bacteria Chlamydia trachomatis. This disease is characterised by a roughening of the inner surfaces of the eyes, and inflammation that may lead to superficial vascularization of the cornea (pannus) and scarring of the conjunctiva. Long term effects include blindness or other visual impairments. Transmission is by direct or indirect contact with the eyes or nose of an infected individual.

**1C23.0****Initial stage of trachoma**

This refers to the initial stage of an infectious disease caused by the Chlamydia trachomatis bacterium which produces a characteristic roughening of the inner surface of the eyelids.

**Inclusions:** Trachoma dubium

**1C23.1****Active stage of trachoma**

This refers to the active stage of an infectious disease caused by the Chlamydia trachomatis bacterium which produces a characteristic roughening of the inner surface of the eyelids.

**1C23.Y****Other specified trachoma****1C23.Z****Trachoma, unspecified****1C2Y****Other specified diseases due to chlamydiae****1C2Z****Diseases due to chlamydiae, unspecified****Rickettsioses (1C30-1C3Z)**

Any disease caused by an infection with the gram-negative bacteria Rickettsia. These diseases commonly present with fever, malaise, and rash. Transmission is commonly through the bite of an infected flea, louse, mite, or tick.

**Coded Elsewhere:** Trench fever (1C11.1)

**1C30****Typhus fever**

A disease caused by an infection with the gram-negative bacteria Rickettsia. This disease is characterised by fever, delirium, back pain, or arthralgia. Transmission is commonly through the bite of an infected flea, louse, mite, or tick.

**Exclusions:** Rickettsiosis due to Ehrlichia sennetsu (1C30-1C3Z)

**1C30.0****Epidemic louse-borne typhus fever due to Rickettsia prowazekii**

This is a form of typhus so named because the disease often causes epidemics following wars and natural disasters. The causative organism is Rickettsia prowazekii, transmitted by the human body louse (*Pediculus humanus corporis*). This diagnosis is due to a species of gram-negative, obligate intracellular parasitic, aerobic bacteria (belonging to the class Alphaproteobacteria) that is the aetiological agent of epidemic typhus, transmitted in the faeces of lice.

- 1C30.1 Recrudescent typhus**  
This is a form of typhus so named because the disease often causes epidemics following wars and natural disasters. The causative organism is Rickettsia prowazekii, transmitted by the human body louse (*Pediculus humanus corporis*).  
*Inclusions:* Brill-Zinsser disease
- 1C30.2 Typhus fever due to *Rickettsia typhi***
- 1C30.3 Typhus fever due to *Orientia tsutsugamushi***  
*Inclusions:* Tsutsugamushi fever
- 1C30.Y Other specified typhus fever**
- 1C30.Z Typhus fever, unspecified**
- 1C31 Spotted fever**  
A disease caused by an infection with the gram-negative bacteria Rickettsia. This disease is characterised by fever, eschar, or rash. Transmission is commonly through the bite of an infected tick.
- 1C31.0 Spotted fever due to *Rickettsia rickettsii***  
*Inclusions:* Rocky Mountain spotted fever  
Sao Paulo fever
- 1C31.1 Spotted fever due to *Rickettsia conorii***  
*Inclusions:* Boutonneuse fever  
Mediterranean tick fever  
African tick typhus  
Kenya tick typhus
- 1C31.2 Spotted fever due to *Rickettsia sibirica***  
*Inclusions:* North Asian tick fever  
Siberian tick typhus
- 1C31.3 Spotted fever due to *Rickettsia australis***  
*Inclusions:* Queensland tick typhus
- 1C31.Y Other specified spotted fever**
- 1C31.Z Spotted fever, unspecified**
- 1C32 Rickettsialpox**  
An acute febrile disease caused by *Rickettsia akari*, which is transmitted from its rodent host by the house-mouse mite *Liponyssoides sanguineus*. An initial skin lesion at the site of a mite bite, often associated with lymphadenopathy, is followed by fever; a disseminated skin rash appears, which generally does not involve the palms and the soles, and lasts only a few days. Death is uncommon.  
*Inclusions:* Kew Gardens spotted fever

**1C33****Q fever**

A disease caused by an infection with the gram-negative bacteria *Coxiella burnetti*. This disease is characterised by fever, or may be asymptomatic. Transmission is by inhalation of the bacteria, contact with contaminated milk, urine, faeces, vaginal mucus, or semen of infected animals, or through the bite of an infected tick.

**Inclusions:** Nine Mile fever

Infection due to *Coxiella burnetii*

Quadrilateral fever

**1C3Y****Other specified rickettsioses****1C3Z****Rickettsioses, unspecified****1C40****Campylobacteriosis**

Campylobacteriosis is caused by *Campylobacter* bacteria (curved or spiral, motile, non-spore-forming, Gram-negative rods). The disease is usually caused by *C. jejuni*, a spiral and comma shaped bacterium normally found in cattle, swine, and birds, where it is nonpathogenic, but the illness can also be caused by *C. coli* (also found in cattle, swine, and birds), *C. upsaliensis* (found in cats and dogs) and *C. lari* (present in seabirds in particular).

**1C41****Bacterial infection of unspecified site**

**Exclusions:** meningococcal infection NOS (1C1C)

chlamydial infection NOS (1C20-1C2Z)

rickettsial infection NOS (1C30-1C3Z)

spirochaetal infection NOS (1C10-1C4Z)

Infection arising from device, implant or graft, not elsewhere classified (NE83.1)

**Coded Elsewhere:** Acute meningococcaemia (1C1C.20)

Disseminated gonococcal infection (1A73)

**1C42****Melioidosis**

A disease caused by the saprophytic environmental gram-negative bacterium *Burkholderia pseudomallei* which is found in soil or water in humid tropical regions of the world, especially South-East Asia and northern Australia. It has protean manifestations ranging from fulminant septicaemia with fatal outcome to chronic low grade infection.

**1C43****Actinomycetoma**

Actinomycetoma is a chronic progressive subcutaneous infection caused by implantation of aerobic branching actinomycetes through a skin wound. These organisms are filamentous bacteria which live as saprophytes in soil or on plants; the commonest infecting agents are Nocardia brasiliensis, Actinomadura madurae and Streptomyces somaliensis. The earliest stage of infection is a firm painless nodule but with time the whole area becomes hard and swollen with multiple papules, pustules and draining sinuses on the skin surface. Extension to underlying bones and joints can result in gross deformity.

**Inclusions:** Mycetoma due to filamentous bacteria

**Exclusions:** Eumycetoma (1F29)

**1C44****Non-pyogenic bacterial infections of the skin**

Skin infection by bacteria which do not characteristically induce pus formation.

**1C45****Toxic shock syndrome**

**Exclusions:** endotoxic shock NOS (1G41)

**1C45.0 Streptococcal toxic shock syndrome****1C45.1 Staphylococcal toxic shock syndrome****1C45.Y Toxic shock syndrome due to other specified infectious agent****1C45.Z Toxic shock syndrome without specified infectious agent****1C4Y****Other specified bacterial diseases****1C4Z****Unspecified bacterial disease****Human immunodeficiency virus disease (1C60-1C62.Z)**

A case of HIV infection is defined as an individual with HIV infection irrespective of clinical stage including severe or stage 4 clinical disease (also known as AIDS) confirmed by laboratory criteria according to country definitions and requirements.

**Coded Elsewhere:** Congenital human immunodeficiency virus infection (KA62.6)

**1C60****Human immunodeficiency virus disease associated with tuberculosis**

**Coded Elsewhere:** Human immunodeficiency disease complicating pregnancy, childbirth or the puerperium (JB63.7)

**1C60.0****HIV disease clinical stage 1 associated with tuberculosis**

### 1C81

#### **Acute poliomyelitis**

A disease of the nervous system, caused by human poliovirus. This disease commonly presents with a fever, sore throat, headache, vomiting, or stiffness of the neck and back. This disease may present with an acute onset of flaccid paralysis. Transmission is commonly by the faecal-oral route or direct contact. Confirmation is by identification of poliovirus in a faecal sample or by a lumbar puncture.

**1C82**

### **Rabies**

A disease caused by infection with the rabies virus. This disease is characterised by fever, and headache, followed by neurological symptoms dominated by a furious or paralytic form.

**1C83**

### **Western equine encephalitis**

**1C84**

### **Eastern equine encephalitis**

**1C85**

### **Japanese encephalitis**

A disease of the brain, caused by an infection with flavivirus. This disease is characterised by fever, headache, meningism, hyperexcitability, or decreased consciousness. This disease may also present with neurological signs such as cranial nerve palsies, tremor and ataxia, parkinsonism, or upper limb paralysis. Transmission is through the bite of an infected mosquito. Confirmation is by identification of flavivirus in a serum sample or cerebrospinal fluid.

**1C86**

### **St Louis encephalitis**

**1C87**

### **Rocio viral encephalitis**

A disease of the brain, caused by an infection with Rocio virus. In the first phase, this disease is characterised by a fever, headache, vomiting, or conjunctivitis; in the second phase, this disease is characterised by neurological symptoms and muscle weakness. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Rocio virus in a serum or cerebrospinal fluid sample.

**1C88**

### **Murray Valley encephalitis**

A disease of the brain, caused by an infection with Murray Valley encephalitis virus. This disease is characterised by fever, headache, nausea, vomiting, tiredness, or may be asymptomatic. Severe cases may present with confusion, fatigue, lack of coordination, or encephalitis. Transmission is through the bite of an infected mosquito. Confirmation is by detection of anti-Murray Valley encephalitis antibodies in a serum sample.

**Inclusions:** Australian encephalitis

**1C8B**

### **California encephalitis**

**Inclusions:** California meningoencephalitis

**1C8C**

### **Venezuelan equine encephalitis**

**1C8D**

### **La Crosse encephalitis**

**1C8E****Viral meningitis, not elsewhere classified**

Any disease of the meninges, caused by an infection with a viral source.

**Coded Elsewhere:** Meningitis due to mumps virus (1D80.2)

Measles complicated by meningitis (1F03.2)

Herpes simplex meningitis (1F00.20)

Varicella meningitis (1E90.1)

Neonatal meningitis (KA65.4)

Meningitis due to human immunodeficiency virus (1C62.2)

Meningitis due to rubella virus (1F02.0)

Meningitis due to Arenavirus (1D61.Y)

Zoster meningitis (1E91.3)

Viral meningitis due to Epstein-Barr virus (1D81.0)

Viral meningitis due to Cytomegalovirus (1D82.Y)

**1C8E.1****Enteroviral meningitis**

A disease of the meninges, caused by an infection with enterovirus. This disease is characterised by high fever, headache, vomiting, nausea, stiff neck, photophobia, drowsiness, skin rash, confusion, seizures, or loss of consciousness. This disease may be asymptomatic in older adults. Transmission is through haematogenous spread to the meninges. Confirmation is by identification of enterovirus through a lumbar puncture, by agglutination tests, or by polymerase chain reaction.

**1C8E.2****Meningitis due to adenovirus**

A disease of the meninges, caused by an infection with adenovirus. This disease is characterised by high fever, headache, vomiting, nausea, stiff neck, photophobia, drowsiness, skin rash, confusion, seizures, or loss of consciousness. This disease may be asymptomatic in older adults. Transmission is through haematogenous spread to the meninges. Confirmation is by identification of adenovirus through a lumbar puncture, by agglutination tests, or by polymerase chain reaction.

**1C8E.Y****Other specified viral meningitis, not elsewhere classified****1C8E.Z****Viral meningitis, unspecified****1C8F****Lymphocytic choriomeningitis**

A disease of the meninges, caused by an infection with lymphocytic choriomeningitis virus. This disease is characterised by fever, stiffness of the neck, malaise, lack of appetite, myalgia, headache, nausea, vomiting, or is asymptomatic. This disease may also present with cough, sore throat, arthralgia, testicular pain, or parotid pain. Transmission is by direct contact with body fluids from an infected rodent, through the bite of an infected rodent, or by droplet transmission. Confirmation is by identification of lymphocytic choriomeningitis virus in a blood or tissue sample.

**Exclusions:** Encephalitis due to Lymphocytic choriomeningitis virus (1D61)  
meningoencephalitis due to Lymphocytic choriomeningitis virus (1D61)

**1C8G****Tick-borne encephalitis**

**1D03****Infectious abscess of the central nervous system**

A focal suppurative process of the brain parenchyma, the intracranial or spinal epidural or subdural space, and less commonly the spinal cord parenchyma. The suppurative process is most commonly associated with bacterial infection, and occasionally with fungal, protozoal, or parasitic infection. Brain abscesses develop most commonly by spread from a contiguous infected site (ear, paranasal sinuses, mastoid air cells, teeth), craniofacial osteomyelitis, and following open head trauma or previous neurosurgical procedure. Haematogenous spread from purulent pulmonary infections, bacterial endocarditis, or other sites of infection can also cause brain abscess. Patients with intracranial abscess present with variable combinations of headache, altered mental status, focal deficits, and seizures. Fever may be present. Patients with intraspinal abscess present with variable degrees of paraparesis or quadripareisis, sensory impairment below the level of the lesion, altered sphincter function, and back pain. The diagnosis is made by CT or MRI imaging, and may be confirmed by histological examination and culture of the abscess material following neurosurgical drainage. Lumbar puncture is usually contraindicated.

**Coding Note:** Code also the causing condition

**1D03.0           Intraspinal intramedullary abscess**

**Coding Note:** Code also the causing condition

**1D03.1           Intraspinal subdural abscess**

**Coding Note:** Code also the causing condition

**1D03.2           Intraspinal extradural abscess**

**Coding Note:** Code also the causing condition

**1D03.3           Intracranial abscess**

A condition of the cranial cavity, caused by an infection with a bacterial, viral, or fungal source. This condition is characterised by a focal accumulation of purulent material within the cranial cavity. This condition may present with fever, headache, and focal neurological deficits.

**Coding Note:** Code also the causing condition

**1D03.30          Deep cerebral hemispheric abscess**

**Coding Note:** Code also the causing condition

**1D03.31          Abscess of the corpus callosum**

**Coding Note:** Code also the causing condition

**1D03.32          Pituitary abscess**

**Coding Note:** Code also the causing condition

**1D03.33** Multiple or widespread intracranial abscess  
Multiple focal suppurative infections within the cranial cavity, including the epidural and subdural spaces, or in the brain, brainstem or cerebellum. The abscesses are typically surrounded by a vascularised capsule. Cerebritis describes nonencapsulated brain abscesses. The infective agent may be bacterial, fungal, or parasitic. The signs and symptoms are variable but typically present as an expanding mass lesion, over a variable period of time, with headache, fever, and a focal neurologic deficit. Seizures may occur. Diagnosis is made by neuroimaging and microbiological testings as Gram stain and culture of abscess material.

**Coding Note:** Code also the causing condition

**1D03.3Y** Other specified intracranial abscess

**Coding Note:** Code also the causing condition

**1D03.3Z** Intracranial abscess, unspecified

**Coding Note:** Code also the causing condition

**1D03.4** **Intraspinal epidural abscess**

A condition of the epidural space, caused by an infection with a bacterial, viral, fungal, or parasitic source. This condition is characterised by a focal accumulation of purulent material within the epidural space. This condition presents with symptoms depending on the location of the abscess. Transmission is through haematogenous spread of the infectious agent commonly from a cutaneous or mucosal source.

**Coding Note:** Code also the causing condition

**1D03.5** **Spinal cord abscess**

A condition of the spinal cord, caused by an infection with a bacterial, viral, or fungal source. This condition is characterised by a focal accumulation of purulent material within the spinal cord. This condition may present with fever, back pain, and neurological deficits. Transmission is through haematogenous spread of the infectious agent.

**Coding Note:** Code also the causing condition

**1D03.Y** **Other specified site of infectious abscess of the central nervous system**

## Dengue (1D20-1D2Z)

Dengue is a viral disease transmitted by the bite of a mosquito infected by dengue viruses. It is one disease entity with different clinical presentations and often with unpredictable clinical evolution and outcome. Most patients recover following a self-limiting non-severe clinical course like nausea, vomiting, rash, aches and pains, but a small proportion progress to severe disease, mostly characterised by plasma leakage with or without haemorrhage, although severe haemorrhages or severe organ impairment can occur, with or without dengue shock.

**1D20**

### Dengue without warning signs

*Inclusions:* Dengue haemorrhagic fever Grade 1

Dengue fever without warning signs

Dengue haemorrhagic fever without warning signs

**1D21**

### Dengue with warning signs

Clinical warning signs are: abdominal pain or tenderness, mucosal bleeding, lethargy and/or restlessness, rapid decrease in platelet count, increase in haematocrit. Other signs can include: persistent vomiting, visible fluid accumulation, liver enlargement more than 2 cm.

**1D22**

### Severe dengue

Clinical signs include: 1. Severe plasma leakage leading to shock (dengue shock syndrome - DSS) and/or fluid accumulation with respiratory distress; 2. severe bleeding as evaluated by clinician, 3. severe organ involvement: Liver AST or ALT  $\geq$  1000, CNS: impaired consciousness, involvement of other organs, as myocarditis or nephritis.

**1D2Z**

### Dengue fever, unspecified

## Certain arthropod-borne viral fevers (1D40-1D4Z)

Siberian tick-borne encephalitis (1C8G.2)

**1D40**

### Chikungunya virus disease

**1D41****Colorado tick fever****1D42****O'nyong-nyong fever****1D43****Oropouche virus disease**

A disease caused by an infection with Oropouche virus. This disease is characterised by fever, headache, neck and back pain, joint pain, or photophobia. This disease may also present with bronchitis, nausea, diarrhoea, abdominal pain or burning sensations all over the body. Transmission is through the bite of an infected mosquito or midge. Confirmation is by detection of the Oropouche virus specific antibodies in a serum sample.

*Inclusions:*           Oropouche fever

**1D44****Rift Valley fever**

A disease caused by an infection with Rift Valley fever virus. This disease is commonly asymptomatic. This disease may also present with fever, liver abnormalities, weakness, back pain, or dizziness. Transmission is through the bite of an infected mosquito. Confirmation is commonly by detection of Rift Valley fever virus specific IgM or IgG antibodies in a blood sample.

**1D45****Sandfly fever**

*Inclusions:*           pappataci fever  
                          phlebotomus fever

**1D46****West Nile virus infection**

A condition caused by an infection with West Nile virus. This condition is commonly asymptomatic. This condition may present with fever, headache, stiffness of the neck, stupor, disorientation, coma, tremors, convulsions, muscle weakness, or paralysis. Transmission is through the bite of an infected mosquito. Confirmation is by detection of IgG or IgM anti-West Nile virus antibodies in a serum sample.

*Inclusions:*           West Nile fever

**1D47****Yellow fever**

A condition caused by an infection with yellow fever virus. This condition is characterised by fever, chills, headache, myalgia, conjunctival congestion, or relative bradycardia. Severe conditions may also present with increasing fever, jaundice, renal failure, or bleeding. Transmission is through the bite of an infected mosquito. Confirmation is by detection of IgM anti-yellow fever virus antibodies in a serum sample.

**1D48****Zika virus disease**

Zika virus infection is caused by the bite of an infected Aedes mosquito. The most common symptoms of Zika virus infection are mild fever and exanthema (skin rash), usually accompanied by conjunctivitis, muscle or joint pain, and general malaise that begins 2-7 days after the bite of the infected mosquito.

**Coded Elsewhere:** Congenital Zika virus infection (KA62.0)

**1D49****Crimean-Congo haemorrhagic fever**

A disease caused by an infection with Crimean-Congo haemorrhagic fever virus. The incubation period ranges from 2 to 9 days. Symptoms/signs typically include high fever, headache, malaise, arthralgia, myalgia, nausea, abdominal pain, and rarely diarrhoea. Early signs typically include fever, hypotension, conjunctivitis, and cutaneous flushing or a skin rash. Later, patients may develop signs of progressive haemorrhagic diathesis, such as petechiae, mucous membrane and conjunctival haemorrhage, haematuria, hematemesis, and melena. Lethality may reach 30%. Transmission occurs via bites of infected ticks, by direct contact with infected animal blood, or iatrogenic transmission. Laboratory diagnosis of the infection during the acute phase of illness consists of detection of viral nucleic acid or by isolation of the virus or by demonstration of viral antigen by enzyme-linked immunoassay from serum or plasma samples. In samples collected later during the illness, diagnosis is confirmed by demonstration of specific IgG and IgM antibodies.

**1D4A****Omsk haemorrhagic fever**

A disease caused by an infection with the Omsk haemorrhagic fever virus. This disease is characterised by fever, chills, headache, gastrointestinal symptoms and bleeding, or muscle pain with vomiting. In severe cases, this disease may also present with encephalitis. Transmission is through the bite of an infected tick, by direct contact with an infected animal, by the faecal-oral route from an infected animal, or by ingestion of milk from infected goats or sheep. Confirmation is by detection of anti-Omsk haemorrhagic fever virus antibodies in a serum sample.

**1D4B****Kyasanur Forest disease**

A disease caused by an infection with Kyasanur Forest disease virus. This disease commonly presents with fever, chills, headache, muscle pain and vomiting, or gastrointestinal symptoms and bleeding. This disease may also present with neurological manifestations such as a severe headache, mental disturbances, tremors, or vision deficits. Transmission is through the bite of an infected tick or by direct contact with an infected animal. Confirmation is by identification of Kyasanur Forest disease virus in a serum sample.

**1D4C****Alkhurma haemorrhagic fever****1D4D****Ross River disease**

A disease caused by an infection with Ross River disease virus. This disease is characterised by arthralgia, with or without arthritis. This disease may also present with fever, fatigue, headache, swollen glands, arthralgia, or maculopapular rash commonly affecting the limbs and trunks. Transmission is through the bite of an infected mosquito. Confirmation is by detection of IgM or IgG anti-Ross River disease virus antibodies in a serum sample.

**Inclusions:**      Epidemic polyarthritis and exanthema

                          Ross River fever

**1D4E****Severe fever with thrombocytopenia syndrome****1D4Y****Other specified arthropod-borne viral fevers****1D4Z****Arthropod-borne viral fever, virus unspecified**

## Certain zoonotic viral diseases (1D60-1D6Z)

**Coded Elsewhere:** COVID-19, virus identified (RA01.0)

Encephalitis due to Arenavirus (1D61.Y)

**1D60**

### Filovirus disease

A severe disease with high lethality caused by filovirus infection. Filovirus disease is typically characterised by acute onset of fever with non-specific symptoms/signs (e.g., abdominal pain, anorexia, fatigue, malaise, myalgia, sore throat) usually followed several days later by nausea, vomiting, diarrhoea, and occasionally a variable rash. Hiccups may occur. Severe illness may include haemorrhagic manifestations (e.g., bleeding from puncture sites, ecchymoses, petechiae, visceral effusions), encephalopathy, shock/hypotension, multi-organ failure, spontaneous abortion in pregnant women when infected. Common laboratory findings include thrombocytopenia, elevated transaminase concentrations, electrolyte abnormalities, and signs of renal dysfunction. Individuals who recover may experience prolonged sequelae (e.g., arthralgia, neurocognitive dysfunction, uveitis sometimes followed by cataract formation), and clinical and subclinical persistent infection may occur in immune-privileged compartments (e.g., CNS, eyes, testes). Person-to-person transmission occurs by direct contact with blood, other bodily fluids, organs, or contaminated surfaces and materials with risk beginning at the onset of clinical signs and increasing with disease severity. Family members, sexual contacts, healthcare providers, and participants in burial ceremonies with direct contact with the deceased are at particular risk. The incubation period typically is 7–11 days (range ≈2–21 days).

**1D60.0**

### Ebola disease

A severe disease with high case fatality caused by infection with Ebola virus or a closely related virus. Ebola disease is typically characterised by acute onset of fever with non-specific symptoms/signs (e.g., abdominal pain, anorexia, fatigue, malaise, myalgia, sore throat) usually followed several days later by nausea, vomiting, diarrhoea, and occasionally a variable rash. Hiccups may occur. Severe illness may include haemorrhagic manifestations (e.g., bleeding from puncture sites, ecchymoses, petechiae, visceral effusions), encephalopathy, shock/hypotension, multi-organ failure, spontaneous abortion in infected pregnant women. Common laboratory findings include thrombocytopenia, elevated transaminase concentrations, electrolyte abnormalities, and signs of renal dysfunction. Individuals who recover may experience prolonged sequelae (e.g., arthralgia, neurocognitive dysfunction, uveitis sometimes followed by cataract formation), and clinical and subclinical persistent infection may occur in immune-privileged compartments (e.g., CNS, eyes, testes). Person-to-person transmission occurs by direct contact with blood, other bodily fluids, organs, or contaminated surfaces and materials with risk beginning at the onset of clinical signs and increasing with disease severity. Family members, sexual contacts, healthcare providers, and participants in burial ceremonies with direct contact with the deceased are at particular risk. The incubation period typically is 7–11 days (range ≈2–21 days).

**1D60.00**

#### Bundibugyo virus disease

Ebola disease caused by Bundibugyo virus.

**1D60.01**

#### Ebola virus disease

Ebola disease caused by Ebola virus.

<b>1D60.02</b>	Sudan virus disease Ebola disease caused by Sudan virus.
<b>1D60.03</b>	Atypical Ebola disease
<b>Coding Note:</b>	This code should be used in conjunction with codes that identify the causative virus. Unusual manifestations of disease include organ-specific (e.g. meningoencephalitis) or systemic inflammatory syndromes associated with viral recrudescence occurring after clinical recovery from acute disease. These manifestations may occur several months following infection. Additionally, this code may be used for unusual presentations of acute disease not included in the general description of Ebola disease.
<b>1D60.0Y</b>	Other specified Ebola disease
<b>1D60.0Z</b>	Ebola disease, virus unspecified
<b>1D60.1</b>	<b>Marburg disease</b>  A severe disease with high case fatality caused by infection with Marburg virus or a closely related virus. Marburg disease is typically characterised by acute onset of fever with non-specific symptoms/signs (e.g., abdominal pain, anorexia, fatigue, malaise, myalgia, sore throat) usually followed several days later by nausea, vomiting, diarrhoea, and occasionally a variable rash. Severe illness may include haemorrhagic manifestations (e.g., bleeding from puncture sites, ecchymoses, petechiae, visceral effusions), encephalopathy, shock/hypotension, multi-organ failure. Common laboratory findings include thrombocytopenia, elevated transaminase concentrations, electrolyte abnormalities, and signs of renal dysfunction. Individuals who recover may experience prolonged sequelae (e.g., arthralgia, neurocognitive dysfunction, uveitis), and clinical and subclinical persistent infection may occur in immune-privileged compartments (e.g., CNS, eyes, testes). Person-to-person transmission occurs by direct contact with blood, other bodily fluids, organs, or contaminated surfaces and materials with risk beginning at the onset of clinical signs and increasing with disease severity. Family members, sexual contacts, healthcare providers, and participants in burial ceremonies with direct contact with the deceased are at particular risk. The incubation period typically is 7–11 days (range ≈2–21 days).
<b>1D60.10</b>	Marburg virus disease Marburg disease caused by Marburg virus or Ravn virus.
<b>1D60.11</b>	Atypical Marburg disease
<b>Coding Note:</b>	This code should be used in conjunction with codes that identify the causative virus. Unusual manifestations of disease include organ-specific (e.g. orchitis, uveitis) or systemic inflammatory syndromes associated with viral recrudescence occurring after clinical recovery from acute disease. These manifestations may occur several months following infection. Additionally, this code may be used for unusual presentations of acute disease not included in the general description of Marburg disease.
<b>1D60.1Y</b>	Other specified Marburg disease
<b>1D60.1Z</b>	Marburg disease, virus unspecified
<b>1D60.Y</b>	<b>Other specified filovirus disease</b>

- 1D60.Z** **Filovirus disease, virus unspecified**
- 1D61** **Arenavirus disease**  
*Coded Elsewhere:* Lymphocytic choriomeningitis (1C8F)
- 1D61.0** **Argentinian haemorrhagic fever**  
A disease endemic to the Argentine Pampas that is caused by an infection with Junín virus and that is characterised by haemorrhagic and neurological manifestations and high lethality (10-30%). The disease begins with a 6-14 day-lasting prodromic phase. Argentinian haemorrhagic fever presents with fever, myalgia, erythema, conjunctival injection, non-menstrual uterine bleeding, epistaxis, haematemesis, melena, haematuria, or shock. Around 20-30% of patients advance to a neurological and haemorrhagic phase. Survivors have a long convalescence period. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Junín virus from blood or mucosal secretions samples.
- 1D61.1** **Bolivian haemorrhagic fever**  
A disease endemic to Bolivia that is caused by an infection with Machupo virus. Early disease symptoms/signs include fever, mild hypertension, headache, bleeding gums, and fatigue. Advanced signs include mucous membrane haemorrhage, epistaxis, melaena, and neurological damage such as tremors, seizures, loss of muscle control, and coma. Onset of disease symptoms occurs usually within seven days of infection. The lethality ranges from 18% to 22%. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Machupo virus from blood or mucosal secretions samples.
- 1D61.2** **Lassa fever**  
A disease endemic in large parts of sub-Saharan Western Africa caused by infection with Lassa virus. Infection is mild or asymptomatic in most cases, but can cause severe illness or death. After a prodromal period of 7-10 days (sometimes longer), initial symptoms/signs include fever, malaise, headache, sore throat, vomiting, abdominal pain, and diarrhoea. Subsequently, patients develop high fever, extreme lethargy, oedema of head/neck, encephalopathy, pleural effusion, and ascites. Bleeding into the skin, mucosae and underlying tissues occurs in the severest cases. Deafness occurs in many patients, and the disease is often particularly severe in pregnancy. The overall lethality can reach 15% even among hospitalized patients receiving supportive care. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Lassa virus in blood samples by molecular or serologic methods.

- 1D61.3 Venezuelan haemorrhagic fever**  
A disease mainly found in rural areas of central Venezuela that is caused by an infection with Guanarito virus. Symptoms/signs among patients include fever, malaise, headache, arthralgia, sore throat, vomiting, abdominal pain, diarrhoea, convulsions, and a variety of haemorrhagic manifestations. The majority of patients also develop leukopenia and thrombocytopenia. The overall lethality may reach 30% even in hospitalised patients receiving supportive care. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Guanarito virus from blood or mucosal secretions samples.
- 1D61.Y Other specified arenavirus disease**
- 1D61.Z Arenavirus disease, unspecified**
- 1D62 Hantavirus disease**  
An acute zoonotic viral disease characterised by abrupt onset of fever, influenza-like clinical signs (e.g., chills, headache, myalgia, dry cough), gastrointestinal signs (e.g., diffuse abdominal pain, vomiting, diarrhoea), transient troubled vision (acute myopia), lumbalgia due to renal swelling, haemorrhagic manifestations to various degrees sometimes followed by rapidly increasing dyspnoea due to non-cardiogenic acute lung oedema, and/or renal involvement. The latter is characterised by initial, often massive proteinuria and microhaematuria sometimes accompanied by transient renal function impediment. All hantavirus infections are heralded by varying degrees of transient thrombocytopenia, which may serve as an indicator of clinical severity.
- 1D62.0 Haemorrhagic fever with renal syndrome**  
Acute zoonotic viral disease with abrupt onset of fever, lower back pain, varying degrees of haemorrhagic manifestations, and renal involvement caused by certain hantaviruses.  
*Inclusions:* Nephropathia epidemica
- 1D62.1 Hantavirus pulmonary syndrome**  
A disease of the respiratory system, caused by infection with certain hantaviruses. This disease is characterised by fever, fatigue, myalgia, headache, chills, nausea, vomiting, diarrhoea, or abdominal pain. This disease may also present with coughing and dyspnoea. Transmission is by the faecal-oral route or airborne transmission.
- 1D62.2 Atypical hantavirus disease**
- 1D62.Y Other specified hantavirus disease**
- 1D62.Z Hantavirus disease, unspecified**
- 1D63 Henipavirus encephalitis**  
Acute bat-borne disease characterised by fever and headaches. The disease may progress to drowsiness, disorientation, mental confusion, and finally encephalitis (brain swelling) in less than a week. This progression may occur with or without an acute respiratory distress component. The incubation period ranges from 4 to 14 days. Lethality is high.

**1D64****Middle East respiratory syndrome**

A disease caused by an infection with Middle East Respiratory Syndrome coronavirus (MERS-CoA). This disease is characterised by severe acute respiratory illness with fever, cough, and shortness of breath. Confirmation is by identification of Middle East Respiratory Syndrome coronavirus from genetic material.

**1D65****Severe acute respiratory syndrome**

A disease of the respiratory system, caused by an infection with coronavirus. This disease is characterised by fever, headache, cough, myalgia, tachycardia, or diarrhoea. This disease may also lead to pneumonia. Transmission is by direct contact, inhalation of infected respiratory secretions, or airborne transmission. Confirmation is by identification of coronavirus in a blood, stool, respiratory secretions, or body tissue sample.

***Inclusions:*** COVID-19, virus identified (RA01.0)

COVID-19, virus not identified (RA01.1)

**1D6Y****Other specified zoonotic viral diseases****1D6Z****Zoonotic viral disease, virus unspecified****Certain other viral diseases (1D80-1E1Z)**

***Coded Elsewhere:*** Congenital Varicella Zoster virus infection (KA62.2)

Other viral diseases complicating pregnancy, childbirth or the puerperium (JB63.5)

Viral duodenitis (DA51.6Y)

Tahyna fever (1D4Y)

**1D80****Mumps**

A disease caused by an infection with mumps virus. This disease commonly presents with fever, headache, fatigue, or eventually parotitis. Transmission is by contact with respiratory secretions, directly or indirectly.

**1D80.0****Mumps without complication****1D80.1****Orchitis due to mumps virus**

Within a few days of infection the mumps virus can attack the testicular glands leading to abrupt onset of fever ranging from 39 to 41 °C, severe testicular pain, scrotal swelling and erythema. Mumps induced orchitis typically presents 1-2 weeks after parotitis. The virus' infiltration into the testicular glands can cause parenchymal inflammation, separation of seminiferous tubules and perivasculär interstitial lymphocyte infiltration. Testicular atrophy can result from a rise in intratesticular pressure. Complications include oligospermia, azoospermia, and asthenospermia, which can contribute to subfertility. Infertility is more common in patients with bilateral mumps orchitis and is estimated to occur in approximately 13% of all patients. Sterility is rarely induced by mumps orchitis.

***Inclusions:*** Mumps orchitis

- 1D80.2 Meningitis due to mumps virus**  
A disease of the meninges, caused by an infection with mumps virus. This disease is characterised by photophobia, vomiting, fever, arthralgia, headache, stiff neck, convulsions, or seizures. This disease may also present with pale, blotchy skin or a distinctive rash. Transmission is by haematogenous spread to the meninges after inhalation of infected respiratory secretions or droplet transmission. Confirmation is by identification of mumps virus in a buccal swab or blood sample.
- Inclusions:* mumps meningitis
- 1D80.3 Encephalitis due to mumps virus**  
An inflammatory process of the brain, frequently with evidence of meningeal involvement, due to infection by mumps virus. The clinical manifestations are usually acute, with fever and variable combinations of convulsions, impaired mental state, and focal deficits. The spinal fluid may show a cellular reaction and elevated protein. Diagnosis is by neuroimaging, spinal fluid analysis and culture, PCR, and serologic tests.
- Inclusions:* Mumps encephalitis
- 1D80.4 Pancreatitis due to mumps virus**  
*Inclusions:* mumps pancreatitis
- 1D80.Y Other specified mumps**
- 1D81 Infectious mononucleosis**  
A disease typically caused by an infection with Epstein-Barr virus or cytomegalovirus. This disease commonly presents with extreme fatigue, fever, acute pharyngitis, body aches, or lymphadenopathy. Transmission is by direct contact with infected body fluids, commonly through saliva.
- Inclusions:* Glandular fever  
Gammaherpesviral mononucleosis
- 1D81.0 Mononucleosis due to Epstein-Barr virus**  
A disease typically caused by an infection with Epstein-Barr virus. This disease commonly presents with extreme fatigue, fever, acute pharyngitis, body aches, or lymphadenopathy. Transmission is by direct contact with infected body fluids, commonly through saliva.
- 1D81.1 Mononucleosis due to cytomegalovirus**  
A disease typically caused by an infection with cytomegalovirus. This disease commonly presents with extreme fatigue, fever, acute pharyngitis, body aches, or lymphadenopathy. Transmission is by direct contact with infected body fluids, commonly through saliva.
- 1D81.Y Other specified infectious mononucleosis**
- 1D81.Z Infectious mononucleosis, unspecified**

**1D82**

### **Cytomegaloviral disease**

Any condition caused by an infection with cytomegalovirus. These conditions are commonly asymptomatic. Transmission is by direct contact with infected body fluids.

**Coded Elsewhere:** Mononucleosis due to cytomegalovirus (1D81.1)

Congenital cytomegalovirus infection (KA62.3)

Intestinal infections due to Cytomegalovirus (1A24)

Cytomegaloviral retinitis (9B72.00)

**1D82.0**

### **Cytomegaloviral hepatitis**

A disease of the hepatic system, caused by an infection with human cytomegalovirus. This disease is characterised by fever, acute pharyngitis, fatigue, lymphadenopathy, or jaundice. Transmission is by direct contact with infected body fluids. Confirmation of an active infection is by identification of human cytomegalovirus in blood, saliva, urine, or other body tissue samples.

### **Cytomegaloviral disease, unspecified**

**1D83**

### **Epidemic myalgia**

A disease caused by an infection with the group B Coxsackie virus. This disease is characterised by pleuritic pain, fever, or muscle swelling. Transmission is by the faecal-oral route.

**Inclusions:** Bornholm disease

**1D84**

### **Viral conjunctivitis**

Inflammation, often mild, of the conjunctiva caused by a variety of viral agents. Conjunctival involvement may be part of a systemic infection.

**Coding Note:**

Code also the causing condition

**Exclusions:** ocular disease herpesviral [herpes simplex] (1F00.1)

Ophthalmic zoster (1E91.1)

**Coded Elsewhere:** Zoster conjunctivitis (1E91.1)

**1D84.0**

### **Conjunctivitis due to adenovirus**

A condition of the conjunctiva, caused by an infection with adenovirus. This condition is characterised by itchy eyes, tearing, redness, discharge, or photophobia (with corneal involvement). Transmission is by direct contact, indirect contact, or droplet transmission.

**Inclusions:** Acute adenoviral follicular conjunctivitis

Swimming-pool conjunctivitis

<b>1D84.1</b>	<b>Acute epidemic haemorrhagic conjunctivitis</b>
	A disease of the conjunctiva, caused by an infection with enterovirus. This disease is characterised by painful and red eyes, swollen lids, conjunctival follicles, chemosis, or subconjunctival haemorrhage. Transmission is by direct contact, or contact with contaminated water.
<b>1D84.Y</b>	<b>Other specified viral conjunctivitis</b>
<b>Coding Note:</b>	Code also the causing condition
<b>1D84.Z</b>	<b>Viral conjunctivitis, unspecified</b>
<b>Coding Note:</b>	Code also the causing condition
<b>1D85</b>	<b>Viral carditis</b>
	A disease of the heart, caused by an infection with a viral source. This disease is characterised by fatigue, dyspnoea, palpitations, malaise, or atypical chest discomfort. This disease may also present with sinus tachycardia, cardiomyopathy, idiopathic ventricular arrhythmias, or cardiovascular collapse. Transmission is by endogenous spread or iatrogenic transmission. Confirmation is identification of the viral source in advanced imaging or cardiac biopsy.
	<b>Exclusions:</b> Influenza myocarditis, other influenza virus identified (1E30)
<b>1D85.0</b>	<b>Dilated cardiomyopathy secondary to viral myocarditis</b>
<b>1D85.1</b>	<b>Acute viral carditis</b>
<b>1D85.2</b>	<b>Chronic viral carditis</b>
<b>1D85.3</b>	<b>Aseptic myocarditis of newborn</b>
<b>1D85.4</b>	<b>Coxsackie carditis</b>
<b>1D85.Y</b>	<b>Other specified viral carditis</b>
<b>1D85.Z</b>	<b>Viral carditis, unspecified</b>
<b>1D86</b>	<b>Viral haemorrhagic fever, not elsewhere classified</b>
	<b>Exclusions:</b> Certain arthropod-borne viral fevers (1D40-1D4Z)
	Certain zoonotic viral diseases (1D60-1D6Z)
	Viral infection of unspecified site (1D90-1D9Z)
<b>Exclusions:</b>	Cytomegaloviral disease (1D82) Herpes simplex infections (1F00)
<b>1D90</b>	<b>Adenovirus infection of unspecified site</b>
	Adenovirus infections most commonly cause illness of the respiratory system; however, depending on the infecting serotype, they may also cause various other illnesses and presentations.

**1D91**

**Enterovirus infection of unspecified site**

**Coded Elsewhere:** Congenital echovirus infection (KA62.4)  
Congenital enterovirus infection (KA62.5)

**1D92**

**Coronavirus infection, unspecified site**

**Exclusions:** Severe acute respiratory syndrome (1D65)  
COVID-19, virus not identified (RA01.1)  
COVID-19, virus identified (RA01.0)

**1D93**

**Parvovirus infection of unspecified site**

**Coded Elsewhere:** Congenital parvovirus syndrome (KA62.7)

**1D9Y**

**Other viral infections of unspecified site**

**1D9Z**

**Unspecified viral infection of unspecified site**

**1E1Y**

**Other specified viral diseases**

**1E1Z**

**Unspecified viral disease**

**Influenza (1E30-1E32)**

Any disease of the respiratory system, caused by an infection with influenza virus. These diseases are characterised by fever, cough, headache, myalgia, arthralgia, or malaise. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of influenza virus from a nasopharyngeal, nose, or throat swab.

**1E30**

**Influenza due to identified seasonal influenza virus**

**Exclusions:** Haemophilus influenzae [H. influenzae] meningitis (1D01.00)  
Haemophilus influenzae [H. influenzae] pneumonia (CA40.02)

**1E31**

**Influenza due to identified zoonotic or pandemic influenza virus**

Influenza, caused by influenza virus strains of special epidemiological importance with an animal-human or inter-human transmission.

For use of this category, reference must be made to the guidelines of the Global Influenza Programme (GIP, [www.who.int/influenza/](http://www.who.int/influenza/)) of WHO.

**Coding Note:**

Influenza caused by influenza virus strains of special epidemiological importance with an animal-human or inter-human transmission limited to the inclusions

**Exclusions:** Haemophilus influenzae [H. influenzae] meningitis (1D01.00)  
Haemophilus influenzae [H. influenzae] pneumonia (CA40.02)

**1E32**

### **Influenza, virus not identified**

Any disease of the respiratory system, caused by an unidentified strain of influenza virus. These diseases are characterised by fever, cough, headache, myalgia, arthralgia, or malaise. Transmission is by inhalation of infected respiratory secretions.

**Inclusions:** Influenza specific virus not stated to have been identified

Viral influenza specific virus not stated to have been identified

**Exclusions:** Haemophilus influenzae [H. influenzae] meningitis (1D01.00)

Haemophilus influenzae [H. influenzae] pneumonia (CA40.02)

## **Viral hepatitis (1E50-1E5Z)**

A group of liver diseases caused by infection with one or more of the five hepatitis viruses, hepatitis A virus, hepatitis B virus, hepatitis C virus, hepatitis D virus and hepatitis E viruses. The infection may be recent and present for less than 6 months (acute hepatitis) or present for more than 6 months (chronic hepatitis), in which case progression to cirrhosis and liver cancer can occur. Transmission is by the faecal-oral route including water contamination, sexual transmission, blood and body fluid contamination (parenteral spread) and from mother to baby at the time of birth (vertical transmission). Depending on the virus, diagnosis is confirmed by detection of specific viral antigens, anti-viral antibodies or viral nucleic acids in serum.

**Exclusions:** Herpes simplex hepatitis (1F00)

Autoimmune hepatitis (DB96.0)

Non-alcoholic steatohepatitis (DB92.1)

**Coded Elsewhere:** Viral hepatitis complicating pregnancy, childbirth or the puerperium (JB63.4)

Congenital viral hepatitis (KA62.9)

**1E50**

### **Acute viral hepatitis**

A group of liver diseases characterised by liver inflammation and fibrosis, caused by more than 6 months of infection with one or more of hepatitis B virus, hepatitis C virus and hepatitis D virus, with or without HIV. Even at stage of cirrhosis there are often no symptoms. Otherwise, clinical features include fatigue, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension). Transmission of hepatitis B and C viruses is by blood and body fluid contamination, sexual transmission, and from mother to baby at the time of birth (vertical transmission). In addition to detection of specific antigens (HBsAg) and antibodies (anti-HCV), diagnostic assessment requires assay of viral nucleic acids (HBV DNA, HCV RNA etc).

**Exclusions:** Infectious liver disease (DB90)

Acute or subacute hepatic failure (DB91)

Chronic viral hepatitis (1E51)

**Coded Elsewhere:** Cytomegaloviral hepatitis (1D82.0)

Epstein-Barr viral hepatitis (DB90.Y)

- 1E50.0      Acute hepatitis A**  
Acute liver injury and inflammation caused by recent and short-term (less than 6 months) infection with hepatitis A virus (HAV). Transmission is by the faecal-oral route. Diagnosis is confirmed by presence of IgM-anti-HAV in serum. Clinical features, if they occur, are characterised by anorexia, nausea and fever, with jaundice in severer cases.
- Exclusions:** Infectious liver disease (DB90)  
Acute or subacute hepatic failure (DB91)
- 1E50.1      Acute hepatitis B**  
Acute liver injury and inflammation caused by recent and short-term (less than 6 months) infection with hepatitis B virus (HBV). Transmission is by sexual, blood and body fluid contamination (parenteral spread), and from mother to baby at the time of birth (vertical transmission). Diagnosis is confirmed by presence of recent acquisition of HBsAg, ideally with IgM-anti-HBc in serum. Clinical features, if they occur, are characterised by anorexia, nausea and fever, with jaundice in severe cases.
- 1E50.2      Acute hepatitis C**  
Acute liver injury and inflammation caused by recent and short-term (less than 6 months) infection with hepatitis C virus (HCV). Transmission is by blood and body fluid contamination (parenteral spread) in most cases, and rarely by sexual spread or from mother to baby at the time of birth (vertical transmission). Diagnosis is confirmed by presence of recent acquisition of anti-HCV with presence of HCV RNA in serum. Clinical features occur in a minority of cases and are characterised by anorexia, nausea and fever, rarely with jaundice. A high proportion of cases (>70%) develop chronic HCV infection, with liver disease of varying severity.
- Coded Elsewhere:** Necrolytic acral erythema (EA20)
- 1E50.3      Acute hepatitis D**  
Acute liver injury and inflammation caused by recent and short-term (less than 6 months) infection with hepatitis D virus (HDV). Transmission only occurs in someone with chronic HBV infection (super-infection) or at the same time as acute hepatitis B (co-infection), and is by blood and body fluid contamination (parenteral spread), and sexual spread. Diagnosis is confirmed by serum IgM-anti-HDV. Clinical features, if they occur, are characterised by anorexia, nausea and fever, with jaundice in severe cases. Acute liver failure occurs in some cases, and a high proportion of cases develops chronic HDV infection.
- Coded Elsewhere:** Acute hepatitis B with Hepatitis D virus co-infection (1E50.1)
- 1E50.4      Acute hepatitis E**  
A disease of the liver, caused by an acute infection with hepatitis E virus. This disease is characterised by nausea. Transmission is commonly by the faecal-oral route. Confirmation is by detection of anti-hepatitis E virus IgM antibodies in an individual's serum.
- 1E50.Y      Other specified acute viral hepatitis**
- 1E50.Z      Acute viral hepatitis, unspecified**

**1E51****Chronic viral hepatitis**

A disease of the liver, caused by a chronic infection with a hepatotropic virus such as hepatitis B, C, D virus, with or without HIV (for six months or longer). This disease is characterised by fatigue, joint and muscle pain, jaundice, or urine of dark yellow colour. Transmission is by sexual contact, or direct contact with contaminated blood or body fluids. Confirmation is by detection of anti-hepatitis antibodies in the individual's serum.

**Exclusions:**

- Alcoholic liver disease (DB94)
- Autoimmune hepatitis (DB96.0)
- Non-alcoholic fatty liver disease (DB92)

**1E51.0****Chronic hepatitis B**

A liver disease characterised by liver inflammation and fibrosis caused by more than 6 months of infection with the hepatitis B virus. Even at stage of cirrhosis there are often no symptoms. Otherwise, clinical features include fatigue, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension). Transmission is by blood and body fluid contamination, sexual transmission, and from mother to baby at the time of birth (vertical transmission). Confirmation of the diagnosis is by detection of HBsAg, but assessment of severity, prognosis and indication for treatment requires quantification of HBV DNA in serum.

**Coded Elsewhere:** Chronic hepatitis B, co-infected with hepatitis D virus (1E51.2)  
Hepatitis B surface antigen [HBsAg] carrier (1E51.Y)

**1E51.00**

## Chronic hepatitis B with human immunodeficiency virus co-infection

A liver disease characterised by liver inflammation and fibrosis caused by more than 6 months of infection with the hepatitis B virus and with the human immunodeficiency virus (HIV). Clinical features include fatigue, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension), and outcomes, including hepatocellular carcinoma are worse than for hepatitis B without HIV infection.

**1E51.0Y**

## Other specified chronic hepatitis B

**1E51.0Z**

## Chronic hepatitis B, unspecified

<b>1E51.1</b>	<b>Chronic hepatitis C</b>
	A liver disease characterised by liver inflammation and fibrosis caused by more than 6 months of infection with the hepatitis C virus. Even at stage of cirrhosis there may be no symptoms. Otherwise, clinical features include fatigue and impaired quality of life, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension). Chronic hepatitis C increases the risks of type 2 diabetes mellitus and cardiovascular disease, which contribute to increased all-cause mortality. Transmission is by blood and body fluid contamination, rarely by sexual transmission and from mother to baby at the time of birth (vertical transmission). Confirmation of the diagnosis is by detection of HCV RNA in the presence of a positive anti-HCV in serum.
	<b><i>Exclusions:</i></b> Non-alcoholic fatty liver disease (DB92)
	<b><i>Coded Elsewhere:</i></b> Chronic hepatitis B, co-infected with hepatitis C virus (1E51.0Y)
	Chronic hepatitis B, co-infected with hepatitis C virus and hepatitis D virus (1E51.0Y)
<b>1E51.2</b>	<b>Chronic hepatitis D</b>
	<b><i>Coded Elsewhere:</i></b> Chronic hepatitis B, co-infected with hepatitis C virus and hepatitis D virus (1E51.0Y)
<b>1E51.3</b>	<b>Chronic hepatitis E</b>
<b>1E51.Y</b>	<b>Other specified chronic viral hepatitis</b>
<b>1E51.Z</b>	<b>Chronic viral hepatitis, unspecified</b>
<b>1E5Z</b>	<b>Viral hepatitis, unspecified</b>

Viral infections characterised by skin or mucous membrane lesions (1E70-1F0Z)

Infections due to poxvirus (1E70-1E7Z)

<b>1E70</b>	<b>Smallpox</b>
	A disease caused by an infection with variola virus. This disease is characterised by a maculopapular rash that progresses to vesicles (commonly on the face, arms, and legs), and fever. Transmission is by direct contact. Confirmation is by identification of the variola virus in a skin sample of the rash.
	In 1980 the 33rd World Health Assembly declared that smallpox had been eradicated. The classification is maintained for surveillance purposes.

***Inclusions:*** Variola

**1E71**

### **Mpox**

A disease caused by an infection with monkeypox virus. In the first phase, this disease is characterised by lymphadenopathy, fever, headache, or malaise; in the second phase, this disease is characterised by a rash that starts as maculopapules and progresses to vesicles, then pustules, followed by crusts (may occur on the face, palms of the hands, soles of the feet, body, and mucous membranes). Transmission is by direct contact with infected animals (including body fluids or lesions), direct contact with body fluid from infected individuals, or through fomites. Confirmation is by identification of monkeypox virus.

**Inclusions:** monkeypox

**1E72**

### **Cowpox**

Cowpox is due to infection by an orthopoxvirus. Human disease is caused by cutaneous inoculation from an infected host. Cowpox is endemic in Europe amongst small rodents, particularly wood mice and wood voles. After a seven day incubation it causes a systemic febrile flu-like illness. Lesions are solitary or few, mainly affecting the face and

hands. An initial erythematous papula or blister later forms a crusted eschar which heals slowly leaving a deep pock-like scar.

**1E73**

### **Vaccinia**

A poxvirus which was formerly used to protect against smallpox. Its use as a vaccine can be complicated by a generalised rash secondary to viraemia, accidental infection of other sites or other individuals, progressive infection at the site of vaccination or, rarely, encephalomyelitis and myopericarditis.

**1E74**

### **Buffalopox**

Buffalopox is caused by an orthopox virus related to vaccinia virus. It is acquired in humans by direct inoculation from infected water buffalo. It is generally a mild illness similar to cowpox with just a few lesions on the hands and arms. It leaves minor pock-like scars.

**1E75**

### **Orf**

Orf is a virus infection of the skin contracted from sheep and goats. Orf is caused by a parapox virus which infects mainly young lambs and goats. Human lesions are caused by direct inoculation of infected material. Orf is not uncommon among sheep farmers, shearers, freezing workers, vets and farmers' wives or their children who bottle-feed lambs. They occur most commonly on the fingers, hands or forearms but can appear on the face.

**1E76**

### **Molluscum contagiosum**

A disease of the skin and mucous membranes, caused by an infection with molluscum contagiosum virus. This disease is characterised by papular skin eruptions, commonly 2-3 millimetres in diameter. Transmission is by direct contact.

**Exclusions:** Viral warts (1E80)

**1E7Y**

### **Other specified infections due to poxvirus**

**1E7Z**

### **Infections due to poxvirus, unspecified**

**Human papillomavirus infection of skin or mucous membrane (1E80-1E8Z)**

Infection of the skin and mucous membranes by the human papillomavirus (HPV), the agent responsible for viral warts in humans. Clinical manifestations depend on the virus subtype and the anatomical site involved.

**Coded Elsewhere:** Anogenital warts (1A95)

**1E80**

**Common warts**

Common warts are due to an infection of the epidermis by certain human papilloma viruses, most commonly HPV subtypes 1, 2, 4, 27 and 57. They manifest typically as papillomatous, keratinous growths on the hands and feet but may affect any part of the skin (and also adjacent mucous epithelia). They are very common during childhood and adolescence.

**Exclusions:** Warts of lips or oral cavity (1E82)

**1E80.0**

**Digital or periungual warts**

Viral warts affecting the fingers, thumbs or non-plantar (or non-weight-bearing) skin of the toes. They are often difficult to eradicate, particularly if the nail folds are involved, but most will eventually resolve spontaneously.

**Exclusions:** Plantar warts (1E80.1)

**1E80.1**

**Plantar warts**

Viral warts affecting the plantar surfaces of the feet including the weight-bearing skin of the toes. They are often painful and are difficult to eradicate. In most cases, however, they do eventually resolve spontaneously.

**1E80.Y**

**Other specified common warts**

**1E80.Z**

**Common warts, unspecified**

**1E81**

**Plane warts**

Plane warts (flat warts) are clinically distinct from common warts and manifest as multiple small flat-topped, often lightly pigmented papules on the face or extremities. They are caused by human papillomavirus (HPV) subtypes 3 and 10.

**1E82**

**Warts of lips or oral cavity**

Infection of the lips and/or oral cavity, particularly the keratinized surfaces of the gingiva and palate, with "skin" type human papillomavirus (types 2 and 4). Focal epithelial hyperplasia (Heck disease) is a specific form of oral human papillomavirus infection caused by types 13 or 32 and of high prevalence in certain communities in the Americas.

**1E82.0**

**Focal epithelial hyperplasia of oral mucous membranes**

Otherwise known as Heck disease, this is due to infection of the oral mucosa by human papillomavirus types 13 or 32. It most commonly presents as multiple smooth mucosal papules, giving rise to a cobblestone appearance. It is particularly common in children from native communities of the Americas with incidence rates of up to 30% reported.

**1E83****Wart virus proliferation in immune-deficient states**

Enhanced proliferation of human papillomavirus as a result of a failure of immune surveillance. This may be due to a genetic defect, disease or iatrogenic immunosuppression.

**1E8Z****Viral warts, not elsewhere classified**

Varicella zoster virus infections (1E90-1E91.Z)

**1E90****Varicella**

A disease caused by an infection with varicella zoster virus. This disease is characterised by a vesicular rash and fever. Transmission is by inhalation of infected respiratory secretions, or direct contact with fluid from vesicles.

**Coded Elsewhere:** Fetal varicella syndrome (KA62.2)

Congenital varicella (KA62.2)

**1E90.0****Varicella without complication**

A disease caused by an infection with varicella zoster virus. This disease is characterised by a vesicular rash and fever. Transmission is by inhalation of infected respiratory secretions, or direct contact with fluid from vesicles.

**1E90.1****Varicella meningitis**

A disease of the meninges, caused by an infection with varicella zoster virus. This infection is characterised by fever, stiff neck, headache, vomiting, photophobia, and sometimes an altered mental status or body aches. Transmission is through hematogenous spread to the meninges after inhalation of infected respiratory secretions, or direct contact with fluid from vesicles. Confirmation is by identification of varicella zoster viral DNA or anti-varicella zoster IgG in cerebrospinal fluid.

**1E90.2****Varicella encephalitis**

**Inclusions:** Postchickenpox encephalitis

Varicella encephalomyelitis

**1E90.Y****Varicella with other specified complication****1E90.Z****Varicella, unspecified****1E91****Zoster**

A disease caused by the reactivation of a latent infection with varicella zoster virus. This disease commonly presents with a rash (typically within one or two adjacent dermatomes), cutaneous hyperesthesia, or fever.

**1E91.0****Zoster without complications**

A painful blistering skin eruption following a dermatomal distribution resulting from reactivation of Varicella zoster virus in dorsal nerve root ganglia.

- 1E91.1** **Ophthalmic zoster**  
A disease of the eyes, caused by the reactivation of a latent infection with varicella zoster virus in the trigeminal nerve. This disease is characterised by a periorbital rash (typically within one dermatome), and conjunctivitis.
- 1E91.2** **Disseminated zoster**  
Disseminated herpes zoster indicates the presence of widespread cutaneous involvement extending beyond the primarily affected and directly adjacent dermatomes. It may be associated with impaired immunity resulting from disease or from therapy.
- 1E91.3** **Zoster with central nervous system involvement**
- 1E91.4** **Acute neuropathy of cranial nerve due to zoster**
- 1E91.40** Acute trigeminal zoster neuropathy
- 1E91.41** Acute herpetic geniculate ganglionitis
- 1E91.4Y** Other specified acute neuropathy of cranial nerve due to zoster
- 1E91.4Z** Acute neuropathy of cranial nerve due to zoster, unspecified
- 1E91.5** **Postherpetic polyneuropathy**
- 1E91.Y** **Zoster with other specified complications**
- 1E91.Z** **Zoster, unspecified**
- 1F00** **Herpes simplex infections**  
Any condition caused by an infection with herpes simplex virus (human herpesviruses 1 and 2). Confirmation is by identification of herpes simplex virus type 1 or 2.
- Exclusions:** Herpangina (1F05.1)
- Coded Elsewhere:** Perinatal Herpes simplex infection (KA62.A)  
Anogenital herpes simplex infection (1A94)  
Sexually transmissible infections due to Herpes simplex virus (1A9Z)
- 1F00.0** **Herpes simplex infection of skin or mucous membrane**  
A disease of the skin and mucous membranes, caused by an infection with herpes simplex virus type 1 or 2. This disease is characterised by vesicles, or may be asymptomatic. Transmission is by direct contact. Confirmation is by identification of herpes simplex virus type 1 or 2.
- Coded Elsewhere:** Anogenital herpes simplex infection (1A94)
- 1F00.00** Herpes simplex infection of skin  
Herpes simplex infection affecting skin and commonly arising from person-to-person inoculation of virus from contact sports such as Rugby football or wrestling.
- 1F00.01** Herpes simplex labialis  
**Inclusions:** cold sore

- 1F00.02** Herpes simplex gingivostomatitis
- 1F00.03** Disseminated cutaneous herpes simplex infection complicating other skin diseases
- 1F00.0Y** Other specified herpes simplex infection of skin or mucous membrane
- 1F00.1** **Herpes simplex infection of the eye**  
A condition of the eye, caused by an infection with herpes simplex virus type 1 or 2. The condition is characterised by blepharoconjunctivitis or keratitis. Transmission is by direct contact. Confirmation is by identification of herpes simplex virus type 1 or 2.  
**Coded Elsewhere:** Herpes simplex conjunctivitis (1D84.Y)
- 1F00.10** Herpes simplex keratitis  
This is a viral disease from the herpesviridae family caused by both Herpes simplex virus type 1 (HSV-1) and type 2 (HSV-2). Infection with the herpes virus is categorized into one of several distinct disorders based on the site of infection. This diagnosis is a condition in which the eye's cornea, the front part of the eye, becomes infected and inflamed.  
**Coded Elsewhere:** Herpetic ulcer of cornea (9A76)
- 1F00.11** Herpes simplex infection of eyelid
- 1F00.1Y** Other specified herpes simplex infection of the eye
- 1F00.1Z** Herpes simplex infection of the eye, unspecified
- 1F00.2** **Herpes simplex infection of central nervous system**  
A condition of the central nervous system, caused by an infection with herpes simplex virus (human herpesviruses 1 and 2). This condition is characterised by fever, headache, or other clinical symptoms depending on the site of infection. Confirmation is by identification of herpes simplex virus type 1 or 2.
- 1F00.20** Herpes simplex meningitis
- 1F00.21** Encephalitis due to herpes simplex virus  
Herpetic encephalitis is a cerebral infection caused by herpes simplex virus type 1 (HSV1). It presents as acute necrosing temporal encephalitis. Onset is rapid (less than 48 hours) with a fever of 40 °C, headaches, and behavioural, language and memory problems. These initial manifestations are followed by numbness and coma, which may be accompanied by convulsions and paralysis. This disease, which affects only a small minority of HSV1-infected individuals, results from a primary immune deficiency.  
**Inclusions:** Simian B disease
- 1F00.2Y** Other specified herpes simplex infection of central nervous system
- 1F00.3** **Disseminated herpes simplex infection**
- 1F00.Y** **Other specified herpes simplex infections**
- 1F00.Z** **Herpes simplex infections, unspecified**

**1F01**

### **Roseola infantum**

A disease caused by an infection with roseolovirus (human herpesvirus type 6 or 7). This disease is characterised by acute fever, followed by macular or maculopapular exanthem in some individuals. Transmission is by inhalation of infected respiratory secretions or direct contact.

**1F02**

### **Rubella**

A disease caused by an infection with the rubella virus. This disease commonly presents with lymphadenopathy, or an exanthem that starts on the face and spreads to the limbs and trunk. Transmission is commonly by inhalation of infected respiratory secretions, or direct contact.

**Coded Elsewhere:** Congenital rubella syndrome (KA62.8)

**1F02.0**

#### **Rubella with neurological complications**

**1F02.1**

#### **Rubella arthritis**

A disease of the joints, caused by an infection with the rubella virus. This disease is characterised by inflammation of the joints leading to arthralgia or difficulties moving the joints. Transmission is by inhalation of infected respiratory secretions, or direct contact. Confirmation is by identification of rubella virus (in nasal or throat swab samples, blood, urine, or cerebrospinal fluid), or detection of rubella virus specific IgM antibodies.

**1F02.2**

#### **Rubella without complication**

Rubella was a common childhood viral infection until the advent of mass immunization programmes. It is characterised by a short-lived maculopapular exanthem, lymphadenopathy and mild fever: the majority of infections are not associated with significant morbidity. Transmission is by inhalation of infected respiratory secretions or by direct contact. Confirmation is by identification of rubella virus in nasal swab, throat swab or blood samples, or by detection of rubella virus specific IgM antibodies. Its public health importance lies in its potential to cause devastating harm to the fetus of an infected mother (congenital rubella syndrome).

**1F02.Y**

#### **Rubella with other specified complication**

**1F03**

### **Measles**

A disease of the respiratory system, caused by an infection with Morbillivirus. This disease is characterised by a blotchy rash, fever, cough, conjunctivitis, or malaise. This disease may also present with tiny white spots with bluish-white centres inside the mouth. Transmission is by inhalation of infected respiratory secretions, airborne transmission or direct contact. Confirmation is by detection of Morbillivirus RNA or measles-specific IgM antibodies.

**Inclusions:** morbilli

**Coded Elsewhere:** Subacute sclerosing panencephalitis (8A45.01)

- 1F03.0 Measles without complication**  
A disease caused by an infection with Morbillivirus. This disease is characterised by fever, cough, coryza, conjunctivitis, enanthema, or maculopapular rash, without any additional secondary pathological conditions. Transmission is by inhalation of infected respiratory secretions, or direct contact. Confirmation is by detection of Morbillivirus RNA, or detection measles-specific IgM antibodies.
- 1F03.1 Measles complicated by encephalitis**  
A disease caused by an infection with Morbillivirus that is complicated by an infection of the brain. This disease is characterised by symptoms of measles as well as inflammation of the brain. This disease may also present with fever, headache, poor appetite, vomiting, confusion, lethargy, or photophobia. Transmission is by haematogenous spread to the brain after inhalation of infected respiratory secretions, by airborne transmission, or by direct contact. Confirmation is by detection of Morbillivirus RNA or measles-specific IgM antibodies.
- 1F03.2 Measles complicated by meningitis**  
A disease caused by an infection with Morbillivirus that is complicated by an infection of the meninges. This disease is characterised by symptoms of measles as well as inflammation of the meninges. This disease may also present with a fever, vomiting, lethargy, confusion, muscle pain, photophobia, or convulsions. Transmission is by haematogenous spread to the meninges after inhalation of infected respiratory secretions, airborne transmission, or direct contact. Confirmation is by detection of Morbillivirus RNA or measles-specific IgM antibodies.
- Inclusions:** Postmeasles meningitis
- 1F03.Y Measles with other complications**
- 1F04 Erythema infectiosum**  
A condition caused by infection with parvovirus B19 (member of the Erythroparvovirus genus). In children, this condition is characterised by fever and cold-like symptoms initially, followed by a skin rash typically in the facial region. In adolescents and adults, this condition may present with painful and swollen joints. Transmission is by droplet transmission, or vertical transmission.
- Inclusions:** Slapped cheek syndrome
- 1F05 Picornavirus infections presenting in the skin or mucous membranes**
- 1F05.0 Enteroviral vesicular stomatitis**  
Enteroviral vesicular stomatitis, commonly called hand, foot and mouth disease, is a highly contagious enterovirus infection (usually Coxsackievirus A16 or Enterovirus 71). It typically causes a mild febrile illness with sore throat and loss of appetite followed by an eruption of vesicles on the lips, hands and feet. The majority of cases occur in children under the age of five.
- Inclusions:** Hand, foot and mouth disease
- 1F05.1 Enteroviral vesicular pharyngitis**

<b>1F05.2</b>	<b>Enteroviral exanthematous fever</b> An acute febrile, characteristically morbilliform exanthem due to infection by one of many different enteroviruses, especially Coxsackievirus and Echovirus.
	<b><i>Exclusions:</i></b> Enteroviral vesicular pharyngitis (1F05.1) Enteroviral vesicular stomatitis (1F05.0)
<b>1F05.3</b>	<b>Foot and mouth disease</b> A rare infection in humans due to the Aphthovirus Foot-and-mouth-disease virus (FMDV), which is responsible for a highly contagious epidemic infection of cloven-hoofed animals, particularly cattle. It manifests in humans with prodromal fever and malaise followed by vesiculation and ulceration of oral mucous membranes and lips. Vesicles may sometimes involve the digits and palmoplantar skin.
	<b><i>Exclusions:</i></b> Hand, foot and mouth disease (1F05.0)
<b>1F05.Y</b>	<b>Other specified picornavirus infections presenting in the skin or mucous membranes</b>
<b>1F0Y</b>	<b>Other specified viral infections characterised by skin or mucous membrane lesions</b>
<b>1F0Z</b>	<b>Viral infections characterised by skin or mucous membrane lesions, unspecified</b>

## Mycoses (1F20-1F2Z)

***Exclusions:*** Mycosis fungoides (2B01)  
Hypersensitivity pneumonitis due to organic dust (CA70)

***Coded Elsewhere:*** Intestinal fungal infections  
Fungal infection of fetus or newborn (KA63)

<b>1F20</b>	<b>Aspergillosis</b> Aspergillosis is a disease caused by fungi of the genus Aspergillus. The organism is ubiquitous, being found in soil and water or in decaying vegetation. While Aspergillus is entirely harmless for most individuals, the spores can cause various forms of mycosis in people with lung diseases or weakened immune system.
	<b><i>Inclusions:</i></b> aspergilloma <b><i>Coded Elsewhere:</i></b> Aspergillus-induced allergic or hypersensitivity conditions (CA82.4) Neonatal aspergillosis (KA63.1)

<b>1F20.0</b>	<b>Invasive aspergillosis</b> A disease caused by an infection with the fungi Aspergillus. This disease is characterised by colonization and invasion of tissue by Aspergillus in one part of the body and may spread to other parts of the body. Transmission is commonly by inhalation of Aspergillus spores.
<b>1F20.00</b>	Invasive aspergillosis of the digestive tract
<b>1F20.01</b>	Invasive cerebral aspergillosis

- 1F20.02** Disseminated aspergillosis  
Invasive aspergillosis affecting three or more organs.
- 1F20.0Y** Invasive aspergillosis of other specified site
- 1F20.0Z** Invasive aspergillosis, unspecified
- 1F20.1** **Non-invasive aspergillosis**
- 1F20.10** Aspergillus otomycosis  
Chronic superficial fungal infection of the external auditory canal and auricle due to saprophytic fungi of the genus Aspergillus.
- 1F20.11** Chronic aspergillosis of the paranasal sinuses  
*Inclusions:* Chronic granulomatous Aspergillus rhinosinusitis
- 1F20.12** Chronic pulmonary aspergillosis  
Chronic pulmonary aspergillosis (CPA) presents as nodular or cavitary lesion(s) in the lungs, of at least three months duration. It is caused by Aspergillus species as demonstrated on histological staining, by positive culture of biopsy, or positive Aspergillus IgG antibodies.  
The most common form of CPA is chronic cavitary pulmonary aspergillosis (CCPA). Untreated it may progress to chronic fibrosing pulmonary aspergillosis (CFPA). Less common manifestations of CPA include Aspergillus nodule and single aspergilloma. All these entities are found in non-immunocompromised patients with prior or current lung disease. Subacute invasive pulmonary aspergillosis (formerly called chronic necrotising pulmonary aspergillosis) is a more rapidly progressive infection (<3 months) usually found in moderately immunocompromised patients.
- 1F20.13** Tonsillar aspergillosis
- 1F20.14** Aspergillus bronchitis
- 1F20.15** Obstructing aspergillus tracheobronchitis
- 1F20.1Y** Other specified non-invasive aspergillosis
- 1F20.1Z** Non-invasive aspergillosis, unspecified
- 1F20.Z** **Aspergillosis, unspecified**
- 1F21** **Basidiobolomycosis**  
Basidiobolomycosis is characterised by a slowly spreading, painless, non-pitting subcutaneous swelling without other obvious clinical signs. It may be single, or there may be multiple satellite lesions. The disc-shaped masses have a uniform hard consistency. It usually involves the limbs or limb-girdle areas and the infection is most often seen in children.  
*Inclusions:* Subcutaneous mucormycosis due to Basidiobolus ranarum

**1F22**

### **Blastomycosis**

A disease caused by an infection with the fungi *Blastomyces dermatitidis*. This disease is characterised by fever, chills, cough, myalgia, arthralgia, or chest pain. This disease may also present in the skin and bones. Transmission is by inhalation of fungal spores. Confirmation is by identification of *Blastomyces dermatitidis* in a urine, cerebrospinal fluid, or blood sample.

**Exclusions:**      Brazilian blastomycosis (1F2E)  
                      keloidal blastomycosis (1F2B)

**1F23**

### **Candidosis**

Candidosis is an infection caused by yeasts of the genus *Candida*. Superficial infections of the mucous membranes and skin are common, but deep invasive disease including fungal sepsis, endocarditis and meningitis may also occur.

**Inclusions:**      moniliasis  
                      candidiasis

**Coded Elsewhere:** Neonatal candidosis (KA63.2)  
                      Invasive neonatal candidosis (KA63.2)

**1F23.0**

### **Candidosis of lips or oral mucous membranes**

A disease of the lips and oral mucous membranes, caused by an infection with the fungi *Candida*. This disease commonly presents with white patches or plaques on the oral mucous membranes, angular cheilitis, or dysphagia. Transmission is by opportunistic transmission. Confirmation is by identification of *Candida* in an oral or skin sample.

**Exclusions:**      Neonatal candidosis (KA63.2)

**1F23.1**

### **Candidosis of skin or mucous membranes**

**Coded Elsewhere:** Neonatal mucocutaneous candidosis (EH12)

**1F23.10**

### **Vulvovaginal candidosis**

A disease caused by an infection with the fungi *Candida*. This disease is characterised by genital itching, burning, or vaginal discharge. Transmission is by endogenous spread, or sexual contact. Confirmation is commonly by identification of *Candida* in a vaginal swab.

**1F23.11**

### ***Candida* balanoposthitis**

A disease caused by an infection with the fungi *Candida* (commonly *Candida albicans*). This disease is characterised by inflammation of the glans or prepuce. This disease may also present with eroded white papules, or white discharge. Transmission is by sexual contact. Confirmation is by identification of *Candida* in a sub-preputial swab or urine sample.

**Inclusions:**      Candidosis of penis  
                      Penile thrush

**1F23.12**

### **Flexural or intertriginous candidosis**

Candidosis of flexural and intertriginous skin, where the warm, moist conditions favour the growth of *Candida* yeasts.

- 1F23.13** Candidosis of nail or paronychium  
Infection of the nail and/or paronychium (nail fold) with Candida yeasts
- 1F23.14** Chronic mucocutaneous candidosis  
Chronic Mucocutaneous Candidiasis is a primary immune deficiency characterised by persistent and/or recurrent infections of skin, nails and mucous membranes, caused by organisms of the genus *Candida*, mainly *C. albicans*.
- 1F23.15** Disseminated cutaneous candidosis
- 1F23.16** Candida otomycosis  
Infection of the external auditory canal with *Candida* yeasts, especially *Candida parapsilosis*. The infection may present with whitish greasy debris in, or discharge from the external auditory canal, or with erythema, oedema and pain. *Candida otomycosis* is less common than otomycosis due to *Aspergillus*. Chronic infection may be associated with perforation of the eardrum.
- 1F23.1Y** Candidosis of skin or mucous membrane of other specified site
- 1F23.1Z** Candidosis of skin or mucous membranes, unspecified
- 1F23.2** **Candidosis of gastrointestinal tract**
- 1F23.3** **Systemic or invasive candidosis**  
Invasion of internal organs by *Candida* yeasts. Risk factors include acute leukemia, haematopoietic stem cell or solid organ transplantation, and acute critical illness. *Candida* species other than *Candida albicans* are commonly implicated.
- Coded Elsewhere:** Invasive neonatal candidosis (KA63.2)  
Candidaemia (MA15.1)
- 1F23.30** Candida meningitis
- 1F23.31** Pulmonary candidosis  
A disease of the pulmonary system, caused by an infection with the fungi *Candida*. This disease is characterised by fever, chills, cough, nausea, vomiting, tachypnoea, tachycardia, or dyspnoea. Transmission is by opportunistic transmission. Confirmation is by identification of *Candida* from a sputum sample.
- 1F23.3Y** Other specified systemic or invasive candidosis
- 1F23.3Z** Systemic or invasive candidosis, unspecified
- 1F23.Y** **Other specified candidosis**
- 1F23.Z** **Candidosis, unspecified**

**1F24**

### **Chromoblastomycosis**

Chromoblastomycosis is a chronic fungal infection of the skin and subcutaneous tissues caused by a variety of pigmented fungi including *Phialophora verrucosa*, *Fonsecaea pedrosoi*, *Fonsecaea compacta* and *Cladophialophora carrionii*, which can be found in soil and wood. The infection usually follows trauma, such as a puncture from a splinter of wood and tends to affect exposed sites such as the feet and ankles. Chromoblastomycosis manifests initially as a warty papule which slowly enlarges to form a hypertrophic, warty plaque. Eventually, after months or many years, large hyperkeratotic masses may form, sometimes with secondary ulceration.

**1F25**

### **Coccidioidomycosis**

A disease caused by an infection with the fungi *Coccidioides*. This disease presents with symptoms depending on the site of infection, or may be asymptomatic. Transmission is commonly by inhalation of fungal spores. Confirmation is by identification or culture of *Coccidioides* from affected tissue or samples, or detection of antibodies against *coccidioides* in serum or cerebrospinal fluid.

**1F25.0**

#### **Pulmonary coccidioidomycosis**

A disease of the pulmonary system, caused by an infection with the fungi *Coccidioides*. This disease is characterised by cough, myalgia, fatigue, chest pain, pneumonia, or pleural effusion. Transmission is commonly by inhalation of fungal spores. Confirmation is by direct examination or culture of *Coccidioides* in a sputum, bronchoalveolar lavage fluid, or tissue sample.

**1F25.00**

#### **Acute pulmonary coccidioidomycosis**

Forty per cent of coccidioidal infections result in symptomatic pulmonary disease that may be indistinguishable from a bacterial community-acquired pneumonia. Radiographically these are usually focal alveolar infiltrates. Infection may be associated with the development of a rash, particularly erythema nodosum and erythema multiforme. Occasionally, there may be symmetric arthralgias or arthritis. Peripheral blood eosinophilia is not uncommon. Acute primary pulmonary coccidioidomycosis, particularly when associated with erythema nodosum and/or erythema multiforme, is frequently called "Valley fever." When associated with arthralgias or arthritis, it has been termed "desert rheumatism."

**1F25.01**

#### **Chronic pulmonary coccidioidomycosis**

A chronic form of pulmonary coccidioidomycosis. Pulmonary sequelae occur in approximately 5% of all cases of acute pulmonary coccidioidomycosis.

**1F25.1**

#### **Extrathoracic coccidioidomycosis**

Coccidioidomycosis involving sites other than the lungs and thoracic cavity. Recognised sites include lymph nodes, bones, joints, central nervous system and skin. Transmission is through haematogenous spread to other body sites after inhalation of fungal spores or by direct inoculation.

- 1F25.10** Disseminated coccidioidomycosis  
Diffuse pulmonary coccidioidomycosis occurs either when there is inhalation of a massive number of arthroconidia, such as may occur during archeological excavations, or among individuals with severely depressed cellular immunity (e.g., late HIV-1 infection [AIDS]; cancer chemotherapy; allogeneic transplant recipients, treatment with corticosteroids; and during the second, third trimesters and postpartum pregnancy). The radiographic appearance often is a mixture of small nodules and interstitial findings, sometimes called "reticulonodular" or, because it may resemble overwhelming pulmonary tuberculosis, "miliary."
- 1F25.11** Primary cutaneous coccidioidomycosis  
Coccidioidomycosis may rarely result from direct inoculation, usually through a puncture of the skin by a thorn or other vegetative structure. The infection generally remains confined to this area with local lymphangitic spread and is not considered indicative of disseminated disease. Coccidioidal serology tests may be positive.
- 1F25.12** Coccidioides meningitis  
An uncommon but often lethal form of coccidioidomycosis due to dissemination of Coccidioides fungi from the primary site of infection, principally the lungs, to the central nervous system.  
*Inclusions:* Coccidioidomycosis meningitis
- 1F25.1Y** Other specified extrathoracic coccidioidomycosis
- 1F25.1Z** Extrathoracic coccidioidomycosis, unspecified
- 1F25.Z** **Coccidioidomycosis, unspecified**
- 1F26** **Conidiobolomycosis**  
Conidiobolomycosis is a subcutaneous infection involving nasal mucosa and paranasal sinuses, leading to formation of firm, subcutaneous nodules or polyps. The infection may be acquired via inhalation of spores or a minor trauma such as an insect bite. The infected host is frequently an otherwise healthy individual working outdoors in tropical areas. Conidiobolomycosis can, however, cause major facial disfigurement. In individuals with impaired immune responses more invasive and potentially fatal infections may occur: such infections are not usually associated with skin lesions.  
*Inclusions:* Rhinoentomophthoromycosis
- 1F27** **Cryptococcosis**  
A disease caused by an infection with the fungi Cryptococcus neoformans or Cryptococcus gattii. This disease commonly presents with shortness of breath, cough, fever, fatigue, or headache. Transmission is by inhalation of fungal spores. Confirmation is by identification of Cryptococcus neoformans or Cryptococcus gattii in a blood, sputum, or cerebrospinal fluid sample.

- 1F27.0      Pulmonary cryptococcosis**  
The pattern of cryptococcal pulmonary disease ranges from asymptomatic airway colonization to pneumonia to acute respiratory distress syndrome. If present, symptoms include cough, dyspnoea or chest pain. Common chest X-ray appearances include nodules or infiltrates. In the immunocompetent host, focal lesions are more commonly seen with infection due to *C. gattii*.
- 1F27.1      Cerebral cryptococcosis**  
A disease of the central nervous system, caused by an infection with the fungi *Cryptococcus neoformans* or *Cryptococcus gattii*. This disease is characterised by fever, headache, lethargy, or neurological deficits. Transmission is by inhalation of fungal spores. Confirmation is by identification of *Cryptococcus neoformans* or *Cryptococcus gattii* in a blood, sputum, or cerebrospinal fluid sample.
- 1F27.10     Meningitis due to *Cryptococcus neoformans***  
Inflammation of the pia and arachnoid and spinal fluid associated with the fungus *Cryptococcus neoformans*. The respiratory tract is the usual portal of entry and meningitis may occur after dissemination to the meninges from the lungs. *C. neoformans* meningitis tends to occur in patients with defective cellular immunity. The meningitis usually evolves subacutely, but may be acute. Clinical features include headache, fever, nausea and vomiting, meningismus, visual disturbances, abnormal mental status, seizures, and raised intracranial pressure. Headache, fever, and stiff neck may be absent. The diagnosis is made by microscopic examination of the spinal fluid, culture of CSF and blood, and the latex agglutination test to detect the capsular polysaccharide antigen in CSF and blood. The organism may be seen on Gram stain or India ink stain of the CSF. The spinal fluid usually shows variable lymphocytic pleocytosis, a low glucose content, and a high protein level.
- 1F27.2      Disseminated cryptococcosis**  
Disseminated cryptococcosis is most common in immunocompromised hosts, with involvement with any organ and predilection for the central nervous system. It may manifest as systemic illness with fever, night sweats and malaise. Blood cultures may be positive (cryptococcaemia).
- 1F27.Y      Other specified cryptococcosis**
- 1F27.Z      Cryptococcosis, unspecified**

**1F28**

### **Dermatophytosis**

Dermatophytosis (tinea, ringworm) is a superficial infection of the skin, hair or nails by dermatophyte fungi of the genera *Trichophyton*, *Epidermophyton* or *Microsporum*. These fungi normally invade only the outer keratinous layer of the epidermis (stratum corneum), the hair shaft and the nail. They count amongst the commonest infections in man. Some species (e.g. *Trichophyton rubrum*) are essentially anthropophilic and infect only man whereas others are zoophilic (e.g. *Trichophyton verrucosum*) but may cause human infection from contact with infected animals.

**Inclusions:** Infections due to species of *Epidermophyton*, *Microsporum* and *Trichophyton*

**Exclusions:** *Tinea nigra* (1F2D.4)

*Tinea versicolor* (1F2D.0)

**1F28.0**

### **Dermatophytosis of scalp**

Dermatophytosis (tinea) affecting scalp and scalp hair. Clinical features range from limited patchy alopecia and scaling to widespread inflammation and suppuration with occipital lymphadenopathy. The scalp is a typical site for a kerion (q.v.), often due to a zoophilic dermatophyte acquired from an infected animal.

**Inclusions:** *Tinea capitis*  
*Scalp ringworm*

**1F28.1**

### **Dermatophytosis of nail**

Fungal infection of the nail plate due to dermatophyte fungi (*tinea unguium*). Infection results in a range of clinical signs including white or yellow discolouration, detachment of the plate from the nail bed (onycholysis), keratinous thickening under the nail plate (subungual hyperkeratosis) and fragility and fragmentation of the abnormal nail plate.

**Inclusions:** *Onychomycosis* due to dermatophyte  
*Tinea unguium*  
*Ringworm of nails*

**Exclusions:** *Onychomycosis* due to non-dermatophyte mould (1F2D.5)  
*Candida onychomycosis* (1F23.13)

**1F28.2**

### **Dermatophytosis of foot**

Dermatophytosis of the skin of the foot (tinea pedis). The lateral interdigital toe clefts are the most common initial site of infection. Longstanding infection with *Trichophyton rubrum*, the most commonly implicated organism in Europe and North America, characteristically causes dry scaling over the sole of the foot. Other species which regularly invade the skin of the foot include *Epidermophyton floccosum* and *Trichophyton interdigitale*.

**Inclusions:** *Moccasin foot*  
*Tinea pedis*  
*Athlete's foot*  
*Ringworm of foot*

- 1F28.3** **Genitocrural dermatophytosis**  
Dermatophyte infection of the inguinocrural folds and adjacent external genitalia (tinea cruris). It presents as erythema and inflammation of affected skin with an advancing scaly edge. It is typically itchy and affects adult men much more commonly than women or children. Dermatophyte infection of the toe clefts commonly co-exists.
- Inclusions:** Tinea cruris  
Ringworm of groin  
Dermatophytosis of groin
- 1F28.4** **Kerion**  
Kerion results from a severe host inflammatory response to dermatophyte infection of the hair follicles of the scalp or beard. It typically presents as a single painful, severely inflammatory, suppurating boggy mass and is most commonly a reaction to a zoophilic dermatophyte infection especially *Trichophyton verrucosum* (cattle ringworm) or *Trichophyton mentagrophytes*.
- 1F28.5** **Disseminated dermatophytosis**  
Extensive and invasive dermatophyte infection due either to a specific genetic anergy to dermatophytes or to profound immunosuppression. Dermal nodules, abscesses or draining sinuses may occur; rarely bone, central nervous system and lymph nodes may be involved.
- 1F28.Y** **Other specified dermatophytosis**
- 1F28.Z** **Dermatophytosis, unspecified**
- 1F29** **Eumycetoma**  
A localised chronic infection caused by various species of fungi and characterised by the formation of aggregates of the causative organisms (grains) within abscesses. This results in severe damage to skin, subcutaneous tissues and bones of the feet, hands and other parts of the body, with draining sinuses which discharge grains to the surface. Recognised agents include *Madurella mycetomatis*, *Madurella grisea*, *Leptosphaeria senegalensis*, *Curvularia lunata*, *Scedosporium apiospermum*, *Neotestudina rosati*,  
*Acremonium* spp. and *Fusarium* spp.  
**Inclusions:** Mycetoma due to fungal infection  
**Exclusions:** Actinomycetoma (1C43)
- 1F2A** **Histoplasmosis**  
Histoplasmosis is a disease caused by the fungus *Histoplasma* that exists worldwide with two significant variants: *Histoplasma capsulatum* and *Histoplasma duboisii*.  
**Coded Elsewhere:** Histoplasmosis-related fibrosing mediastinitis (CB22.0)

- 1F2A.0      Pulmonary histoplasmosis capsulati**  
A disease of the pulmonary system, caused by an infection with the fungi *Histoplasma capsulatum*. This disease is characterised by fever, chest pains, or a dry, nonproductive cough. Transmission is by inhalation of fungal spores, commonly from contaminated soil, or bat or bird faeces. Confirmation is by identification of *Histoplasma capsulatum* from affected tissue or body fluids, detection of antibodies against *Histoplasma capsulatum*, or detection of *Histoplasma capsulatum* antigen.
- 1F2A.1      Histoplasmosis due to *Histoplasma duboisii***  
This form of histoplasmosis is endemic to Sub-Saharan Africa and is generally less virulent than histoplasmosis due to *H. capsulatum*, the classical form which occurs predominantly in tropical and subtropical regions of the Americas but is also seen in Africa and Asia. Otherwise known as African histoplasmosis, histoplasmosis due to *Histoplasma duboisii* usually involves the skin and subcutaneous tissue, lymph nodes and bones and rarely the lungs and other internal organs.
- 1F2A.Y      Other specified histoplasmosis**
- 1F2A.Z      Histoplasmosis, unspecified**
- 1F2B      Lobomycosis**  
A disease of the skin, caused by an infection with the fungi *Lacazia lbooi*. This disease commonly presents with dermal nodules (either lenticular or in plaques), keloids, subcutaneous mycoses, or malignant tumours. Transmission is commonly by direct contact with contaminated water, soil, vegetation, or may be by direct contact with an infected dolphin. Confirmation is by identification of *Lacazia lbooi* in a lesion exudate or tissue sample.
- Inclusions:**      Lobo disease
- 1F2C      Mucormycosis**  
A disease caused by an infection with the fungi from the order Mucorales. This disease presents with symptoms depending on the site of the infection. Transmission is by direct contact with infected soil or decaying matter. Confirmation is by identification of fungi from the order Mucorales from a tissue sample.
- 1F2D      Non-dermatophyte superficial dermatomycoses**  
Any condition of the skin and mucous membranes, caused by an infection with fungi other than *Candida* and dermatophytes.
- Exclusions:**      Candidosis (1F23)  
                        Dermatophytosis (1F28)
- 1F2D.0      Pityriasis versicolor**  
A disease of the skin, caused by an infection with the fungi *Malassezia*. This disease is characterised by white, pink, fawn, brown, or often coalescing lesions that may be covered with thin furfuraceous scales. This disease commonly presents on the trunk, shoulders and arms, or neck and face. Transmission is by opportunistic transmission. Confirmation is by identification of *Malassezia* in a skin sample.

- 1F2D.1** **Malassezia folliculitis**  
Malassezia folliculitis is caused by the invasion of the hair follicle by Malassezia yeasts. Although Malassezia yeasts are a part of the normal human microflora, under certain conditions they can cause superficial dermatological conditions. The invasion results in the development of erythematous papules, and sometimes pustules, which may be either asymptomatic or itchy. Usually Malassezia yeasts are present along with staphylococci and propionibacteria in the follicles.
- Inclusions:** Seborrhoeic folliculitis  
**Exclusions:** Seborrhoea (ED91.2)
- 1F2D.2** **White piedra**  
A disease of the hair shaft, caused by an infection with the fungi Trichosporon beigelii. This disease is characterised by irregular, soft, white, or light brown nodules which adhere to the hair follicle. Transmission is by direct contact with contaminated soil or water, or by airborne transmission. Confirmation is by identification of Trichosporon beigelii in a hair follicle sample.
- Inclusions:** Trichosporosis nodosa
- 1F2D.3** **Black piedra**  
**Inclusions:** Trichomycosis nodularis
- 1F2D.4** **Tinea nigra**  
A disease of the skin, caused by an infection with the fungi Tinea nigra. This disease is characterised by brown to black macules; small, flat circumscribed changes in the colour of skin. This disease commonly presents on the palmar surfaces, soles, or other skin surfaces. Transmission is by direct contact with contaminated soil, wood, or vegetation. Confirmation is identification of Tinea nigra in a skin sample.
- Inclusions:** Keratomycosis nigricans palmaris
- 1F2D.5** **Onychomycosis due to non-dermatophyte mould**  
Fungal nail infection due to organisms other than Candida and dermatophytes. These include Scopulariopsis brevicaulis, Neoscytalidium dimidiatum, Fusarium spp., and Aspergillus spp., which may not respond to therapies directed at the more common causes of onychomycosis.
- Exclusions:** Candidosis of nail or paronychium (1F23.13)
- 1F2D.Y** **Other specified non-dermatophyte superficial dermatomycoses**
- 1F2D.Z** **Non-dermatophyte superficial dermatomycoses, unspecified**
- 1F2E** **Paracoccidioidomycosis**  
A disease caused by an infection with the fungi Paracoccidioides brasiliensis. This disease commonly presents with fever, toxæmia, weight loss, adenopathy, hepatosplenomegaly, anaemia, or eosinophilia. This disease may present with symptoms similar to tuberculosis, leukaemia, or lymphoma. Transmission is by inhalation of fungal spores. Confirmation is by identification of Paracoccidioides brasiliensis in a blood, sputum, or skin sample.

- 1F2E.0** **Pulmonary paracoccidioidomycosis**  
A disease of the pulmonary system, caused by an infection with the fungi Paracoccidioides brasiliensis. This disease is characterised by fever, cough, dyspnoea, or malaise. Transmission is by inhalation of fungal spores. Confirmation is by identification of Paracoccidioides brasiliensis in a blood or sputum sample.
- 1F2E.1** **Disseminated paracoccidioidomycosis**  
Disseminated paracoccidioidomycosis results from haematogenous and lymphatic dissemination of yeasts from the lungs and aerodigestive tract. Cutaneous involvement, seen in 25% of cases, presents as crusted papules, ulcers, nodules, and verrucous plaques. Lymphadenopathy occurs commonly in the cervical region, but all lymph node chains can be involved. Adrenal glands are commonly affected with a significant risk of adrenal insufficiency and Addisonian crisis. Long bones such as ribs, humeri, and clavicles can be involved. Mesenteric lymph node involvement can lead to bowel obstruction. Meningoencephalitis occurs in up to one quarter of cases.
- 1F2E.Y** **Other specified paracoccidioidomycosis**
- 1F2E.Z** **Paracoccidioidomycosis, unspecified**
- 1F2F** **Phaeohyphomycosis**
- 1F2G** **Pneumocystosis**  
*Coded Elsewhere:* HIV disease resulting in Pneumocystis jirovecii pneumonia (1C62.2)
- 1F2G.0** **Pulmonary pneumocystosis**  
An opportunistic pulmonary infection by the fungus Pneumocystis jirovecii. It is strongly associated with HIV and AIDS.  
*Coded Elsewhere:* Pneumonia due to pneumocystis (CA40.20)
- 1F2G.Z** **Pneumocystosis, unspecified**
- 1F2H** **Scedosporiosis**  
An opportunistic infection caused by fungal species of the genus Scedosporium. The most common clinical presentation is disseminated infection, which is associated with underlying disease, especially haematological malignancy, or with organ transplantation, especially of the lung. Infections of lung, bones or joints are also well recognised.
- 1F2J** **Sporotrichosis**  
A disease caused by an infection with the fungi Sporothrix schenckii. This disease presents with symptoms depending on the site of infection. Transmission is by direct contact with infected thorny plants, sphagnum moss, soil, bales of hays, or infected plant material. Confirmation is by identification of Sporothrix schenckii from a tissue or skin sample.

- 1F2J.0 Lymphocutaneous sporotrichosis**  
This is the most common type of sporotrichosis and follows implantation of *Sporothrix schenckii* spores into a cutaneous wound, most commonly on the upper extremity. In addition to a localised nodule or pustule, a chain of nodules develops along draining lymphatics. In longstanding cases regional lymph nodes may become involved.
- 1F2J.1 Fixed cutaneous sporotrichosis**  
Cutaneous sporotrichosis which remains localised to the area of inoculation.
- 1F2J.2 Pulmonary sporotrichosis**  
Pulmonary forms of infection, although uncommon, can occur when *Sporothrix schenckii* conidia are inhaled.  
Symptoms of pulmonary sporotrichosis mimic those of tuberculosis including constitutional complaints of fever, night sweats, weight loss, and fatigue as well as respiratory complaints including dyspnoea, cough, purulent sputum, and haemoptysis.
- 1F2J.3 Disseminated sporotrichosis**
- 1F2J.Y Other specified sporotrichosis**
- 1F2J.Z Sporotrichosis, unspecified**
- 1F2K Talaromycosis**  
Talaromycosis is an infection due to *Talaromyces marneffei*, an ubiquitous saprophyte of soil and decomposing organic matter. This dimorphic fungus, formerly known as *Penicillium marneffei*, is endemic to Southeast Asia and the southern part of China. Once considered rare, its occurrence has increased due to AIDS. It is now the third most common opportunistic infection in HIV-positive individuals. The most common symptoms are fever, skin lesions, anaemia, generalised lymphadenopathy, and hepatomegaly.
- 1F2L Emmonsiosis**  
An opportunistic infection caused by a variety of *Emmonsia* and *Emmonsia*-like fungal species. It was historically seen as a rare lung pathogen but is now increasingly reported as a disseminated infection in persons immunosuppressed, particularly as the result of HIV infection.
- 1F2L.0 Disseminated adiaspiromycosis**  
An increasingly reported fulminant fungal infection caused by *Emmonsia* and *Emmonsia*-like fungal species. It is seen in the context of profound immunosuppression, especially from HIV infection. This is in contrast with pulmonary adiaspiromycosis, which is also caused by *Emmonsia* species but typically affects immunocompetent individuals. Its clinical presentation is similar to those of histoplasmosis and blastomycosis. Skin and lung involvement is characteristic but the CNS and blood may also be affected.
- Exclusions:** Pulmonary adiaspiromycosis (1F2L.1)

**1F2L.1** **Pulmonary adiaspiromycosis**  
Pulmonary adiaspiromycosis is an infection of the lungs due to inhalation of spores of the saprophytic soil fungus Chrysosporium parvum (formerly Emmonsia parva). The fungus affects many species of rodents but may occasionally infect humans. It is characterised by the presence of huge spherules (adiaspores) in the lungs.

**Inclusions:** Adiaspiromycosis

**1F2L.Y** **Other specified emmonsiosis**

**1F2L.Z** **Emmonsiosis, unspecified**

**1F2Y** **Other specified mycoses**

**1F2Z** **Mycoses, unspecified**

## Parasitic diseases (1F40-1G2Z)

**Coded Elsewhere:** Parasitic diseases in the fetus or newborn (KA64)

### Malaria (1F40-1F4Z)

A disease caused by an infection with a protozoan parasite from the Plasmodium genus. This disease commonly presents with fever, chills, headache, nausea and vomiting, or malaise. Transmission is through the bite of an infected mosquito. Confirmation is commonly by identification of the Plasmodium genus in a blood sample.

**Coding Note:** In cases of mixed malaria code all relevant types separately.

**Coded Elsewhere:** HIV disease clinical stage 4 associated with malaria (1C61.3)

HIV disease clinical stage 3 associated with malaria (1C61.2)

HIV disease clinical stage 2 associated with malaria (1C61.1)

HIV disease clinical stage 1 associated with malaria (1C61.0)

Human immunodeficiency virus disease associated with malaria (1C61)

Malaria complicating pregnancy, childbirth, or the puerperium (JB63.60)

Other congenital malaria (KA64.Y)

**1F40** **Malaria due to Plasmodium falciparum**

A disease caused by an infection with the protozoan parasite Plasmodium falciparum. This disease is characterised by fever, chills, headache, myalgia, arthralgia, weakness, vomiting, or diarrhoea. This disease may also present with splenomegaly, anaemia, thrombocytopenia, hypoglycaemia, pulmonary or renal dysfunction, or neurologic changes. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium falciparum in a blood sample.

**Coding Note:** Includes mixed infections of Plasmodium falciparum with any other Plasmodium species.

**Coded Elsewhere:** Congenital falciparum malaria (KA64.1)

<b>1F40.0</b>	<b>Plasmodium falciparum malaria with cerebral complications</b> A disease of the cerebrum, caused by an infection with the protozoan parasite Plasmodium falciparum. This disease commonly presents with retinal whitening, splenomegaly, anaemia, thrombocytopenia, hypoglycaemia, pulmonary dysfunction, renal dysfunction, or neurologic changes. This disease may also present with fever, chills, headache, myalgia, arthralgia, weakness, vomiting, or diarrhoea. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium falciparum in a blood sample.
<b>1F40.Y</b>	<b>Other severe and complicated Plasmodium falciparum malaria</b>
<b>Coding Note:</b>	Includes mixed infections of Plasmodium falciparum with any other Plasmodium species.
<b>1F40.Z</b>	<b>Malaria due to Plasmodium falciparum, unspecified</b>
<b>Coding Note:</b>	Includes mixed infections of Plasmodium falciparum with any other Plasmodium species.
<b>1F41</b>	<b>Malaria due to Plasmodium vivax</b> A disease caused by an infection with the protozoan parasite Plasmodium vivax. This disease is characterised by fever, chills, headache, nausea and vomiting, body aches, or general malaise. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium vivax in a blood sample.  <b>Exclusions:</b> when mixed with Plasmodium falciparum (1F40)
<b>1F41.0</b>	<b>Plasmodium vivax malaria with rupture of spleen</b>
<b>1F41.Y</b>	<b>Malaria due to Plasmodium vivax with other complications</b>
<b>1F41.Z</b>	<b>Plasmodium vivax malaria without complication</b>
<b>1F42</b>	<b>Malaria due to Plasmodium malariae</b> A disease caused by an infection with the protozoan parasite Plasmodium malariae. This disease is characterised by fever, chills, headache, nausea and vomiting, body aches, or general malaise. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium malariae in a blood sample.  <b>Exclusions:</b> when mixed with Plasmodium vivax (1F41) when mixed with Plasmodium falciparum (1F40)
<b>1F42.0</b>	<b>Plasmodium malariae malaria with nephropathy</b> Quartan malarial nephropathy is a rare complication of malariae (quartan) malaria, especially occurring in children; it is a glomerulonephritis, usually fatal.
<b>1F42.Y</b>	<b>Malaria due to Plasmodium malariae with other complications</b>
<b>1F42.Z</b>	<b>Plasmodium malariae malaria without complication</b>

**1F43**

### **Malaria due to Plasmodium ovale**

A disease caused by an infection with the protozoan parasite Plasmodium ovale. This disease is characterised by fever, chills, headache, nausea and vomiting, body aches, or general malaise. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium ovale in a blood sample.

- Exclusions:**
- when mixed with Plasmodium malariae (1F42)
  - when mixed with Plasmodium falciparum (1F40)
  - when mixed with Plasmodium vivax (1F41)

**1F44**

### **Other parasitologically confirmed malaria**

**1F45**

### **Malaria without parasitological confirmation**

Clinically diagnosed malaria without parasitological confirmation

- Inclusions:**
- Clinically diagnosed malaria without parasitological confirmation

**1F4Z**

### **Malaria, unspecified**

**Coding Note:** In cases of mixed malaria code all relevant types separately.

Nonintestinal protozoal diseases (1F50-1F5Z)

Infections with unicellular organisms of the subkingdom Protozoa.

**Exclusions:** Protozoal intestinal infections (1A30-1A3Z)

**Coded Elsewhere:** Amoebiasis (1A36)

Malaria without parasitological confirmation (1F45)

Protozoal diseases complicating pregnancy, childbirth or the puerperium (JB63.6)

**1F50**

### **Acanthamoebiasis**

**1F51**

### **African trypanosomiasis**

A disease caused by an infection with the protozoan parasite Trypanosoma brucei. This disease presents with symptoms depending on the form of the protozoan parasite (Trypanosoma brucei rhodesiense or Trypanosoma brucei gambiense). Transmission is through the bite of an infected tsetse fly. Confirmation is by identification of Trypanosoma brucei in a blood or tissue sample.

**1F51.0**

### **Gambiense trypanosomiasis**

A disease caused by an infection with the protozoan parasite Trypanosoma brucei gambiense. This disease is characterised by fever, headache, muscle and joint aches, or malaise. This disease may also present with lymphadenopathy, weight loss, or neurological deficits. Transmission is through the bite of an infected tsetse fly. Confirmation is by identification of Trypanosoma brucei gambiense in a biopsy of the lymph node.

**Inclusions:** West African sleeping sickness

Infection due to Trypanosoma brucei gambiense

- 1F51.00** Meningitis in Gambiense trypanosomiasis
- 1F51.0Y** Other specified gambiense trypanosomiasis
- 1F51.0Z** Gambiense trypanosomiasis, unspecified
- 1F51.1** **Rhodesiense trypanosomiasis**  
A disease caused by an infection with the protozoan parasite *Trypanosoma brucei rhodesiense*. This disease is characterised by a chancre at the site of the bite. This disease may also present with fever, headache, muscle and joint aches, or lymphadenopathy. Transmission is through the bite of an infected tsetse fly. Confirmation is by identification of *Trypanosoma brucei rhodesiense* in a blood sample, lymph node fluid, or biopsy of the chancre.
- Inclusions:**
- East African sleeping sickness
  - Infection due to *Trypanosoma brucei rhodesiense*
- 1F51.10** Meningitis in Rhodesiense trypanosomiasis
- 1F51.1Y** Other specified rhodesiense trypanosomiasis
- 1F51.1Z** Rhodesiense trypanosomiasis, unspecified
- 1F51.Y** **Other specified african trypanosomiasis**
- 1F51.Z** **African trypanosomiasis, unspecified**
- 1F52** **Babesiosis**  
A disease caused by the protozoan parasite *Babesia*. This disease is characterised by reproduction and lysis of erythrocytes leading to symptoms that depend on the level of parasitaemia and immune status of the infected individual. This disease may present with fever, chills, malaise, myalgia, haemolytic anaemia, shock, or may be asymptomatic. Transmission is through the bite of an infected tick (*Ixodes*), or vertical transmission. Confirmation is by identification of *Babesia* in a blood smear, or detection of antibodies against *Babesia*.
- Inclusions:**
- Piroplasmosis
- 1F53** **Chagas disease**  
A disease caused by an infection with the protozoan parasite *Trypanosoma cruzi*. This disease is characterised by fever, headache, lymphadenopathy, pallor, muscle pain, dyspnoea, swelling, or abdominal or chest pain. This disease may also be asymptomatic. Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of *Trypanosoma cruzi* in a blood sample.
- Inclusions:**
- American trypanosomiasis
  - infection due to *Trypanosoma cruzi*

- 1F53.1 Acute Chagas disease without heart involvement**  
A disease caused by an acute infection with the protozoan parasite Trypanosoma cruzi. This disease is characterised by fever, headache, lymphadenopathy, pallor, muscle pain, dyspnoea, swelling, or abdominal or chest pain. This disease presents with no cardiac involvement. Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of Trypanosoma cruzi in a blood sample.
- 1F53.2 Chronic Chagas disease with heart involvement**  
A disease caused by a chronic infection with the protozoan parasite Trypanosoma cruzi. This disease commonly presents with severe malaise or cardiac involvement (such as cardiomyopathy, cardiac failure, thromboembolism, bradyarrhythmias, tachyarrhythmias, apical aneurysms, or cardiac arrest). Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of Trypanosoma cruzi in a blood sample.
- 1F53.3 Chagas disease with digestive system involvement**  
A disease caused by an infection with the protozoan parasite Trypanosoma cruzi. This disease is characterised by severe malaise or digestive system involvement (such as megaoesophagus or megacolon). Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of Trypanosoma cruzi in a blood sample.
- 1F53.4 Meningitis in Chagas disease**
- 1F53.Y Other specified Chagas disease**
- 1F53.Z Chagas disease, unspecified**
- 1F54 Leishmaniasis**  
Leishmaniasis is due to infection by vector-borne protozoa from the genus Leishmania. These protozoa exist as obligate intracellular parasites in human and mammalian hosts and are transmitted from host to host by certain species of sandfly. Depending on the Leishmania species involved, the resultant disease picture may range from a localised cutaneous ulcer through extensive mucocutaneous destruction to severe systemic disease.
- 1F54.0 Visceral leishmaniasis**  
A disease caused by an infection with the protozoan parasite Leishmania. This disease is characterised by biphasic fever, hepatosplenomegaly, pancytopenia, wasting, darkening of the skin, or may be asymptomatic. Transmission is through the bite of an infected female phlebotomine sandfly. Confirmation is by identification of Leishmania from a tissue or blood sample, or detection of antibodies against Leishmania.
- Inclusions:** Kala-azar

**1F54.1****Cutaneous leishmaniasis**

Cutaneous leishmaniasis results from bites by sandflies infected by protozoan parasites of the genus *Leishmania*. *Phlebotomus* is the principal vector in the Old World (Mediterranean, North Africa, Ethiopia and Asia), where *L. major*, *L. tropica*, *L. aethiopica* and *L. donovani* infantum predominate. Other sandflies are responsible for transmitting the New World species, *L. mexicana* and *L. brasiliensis*. The commonest presentation is with one or more crusted nodules or ulcers on exposed sites which gradually heal with scarring. Mexican and Ethiopian forms have a tendency to cause diffuse infiltration of the skin; South American forms frequently progress to mucocutaneous leishmaniasis.

**Coded Elsewhere:** Post-kala-azar dermal leishmaniasis (1F54.0)

**1F54.2****Mucocutaneous leishmaniasis**

Mucocutaneous leishmaniasis is a secondary infection of nasal and oral mucosae, predominantly by *Leishmania brasiliensis*. It usually first manifests within two years of initial cutaneous infection but often after the latter has healed. It results from lymphatic or haematogenous spread of infection and can cause severe local tissue destruction.

**Inclusions:** *Leishmania brasiliensis* infection

**1F54.Z****Leishmaniasis, unspecified****1F55****Naegleriasis**

Any condition caused by an infection with the protozoan parasite *Naegleria*.

**1F56****Rhinosporidiosis**

Rhinosporidiosis is a chronic, usually painless localised infection of the mucous membranes. Formerly believed to be a fungus, the causative agent, *Rhinosporidium seeberi*, has also never been cultured. With 18S rDNA sequencing, this organism has been shown to be a protistan parasite. Rhinosporidiosis occurs worldwide, and the greatest numbers of cases are found in southern India and Sri Lanka.

**1F57****Toxoplasmosis**

A disease caused by an infection with the protozoan parasite *Toxoplasma gondii*. This disease is characterised by fever, lymphadenitis, sore throat, or rash. Transmission is by direct ingestion of contaminated food, indirectly by food or water contaminated with infected cat faeces, or vertical transmission. Confirmation is by detection of antibodies against *Toxoplasma gondii*, or identification of *Toxoplasma gondii* in tissue, cerebrospinal fluid, blood, or other body fluids.

**Coded Elsewhere:** Congenital toxoplasmosis (KA64.0)

**1F57.0****Hepatitis due to *Toxoplasma gondii***

A disease of the liver, caused by an infection with the protozoan parasite *Toxoplasma gondii*. This disease is characterised by jaundice. Transmission is by haematogenous spread to the liver after direct ingestion of contaminated food, or indirect transmission by consumption of food or water contaminated with infected cat faeces. Confirmation is by detection of antibodies against *Toxoplasma gondii* in a blood sample or identification of *Toxoplasma gondii* in hepatic tissue.

- 1F57.1 Meningoencephalitis due to *Toxoplasma gondii***  
A disease of the meninges and brain, caused by an infection with the protozoan parasite *Toxoplasma gondii*. This disease is characterised by seizures, neck pain, neurological deficits, or alterations in behaviour, cognition, or consciousness. Transmission is by haematogenous spread to the meninges and brain after direct ingestion of contaminated food, or indirect transmission by consumption of food or water contaminated with infected cat faeces. Confirmation is by detection of antibodies against *Toxoplasma gondii* in cerebrospinal fluid or identification of *Toxoplasma gondii* in cerebrospinal fluid, and advanced imaging of the nervous system.
- Inclusions:** Toxoplasma meningoencephalitis
- 1F57.2 Pulmonary toxoplasmosis due to *Toxoplasma gondii***  
In immunodeficient patients, toxoplasmosis most often occurs in persons with defects in T cell-mediated immunity such as those receiving corticosteroids, anti-tumour necrosis factor (TNF) therapies, or cytotoxic drugs and those with hematologic malignancies, organ transplants, or acquired immunodeficiency syndrome (AIDS).  
Pulmonary toxoplasmosis in the immunodeficient patient may appear in the form of interstitial pneumonitis, necrotizing pneumonitis, consolidation, pleural effusion, or empyema, or all of these.  
AIDS patients with *Toxoplasma* pneumonia present with cough, dyspnoea, and fever. As toxoplasmosis is generally seen only in advanced HIV infection with CD4 counts below 100, the majority of AIDS patients who develop toxoplasma pneumonia already have had previous HIV-associated opportunistic infections. In solid organ transplant patients, this is most commonly due to transplantation of a toxoplasma-seropositive lung or heart into a seronegative recipient, resulting in primary pulmonary disease. In bone marrow transplant patients, pulmonary toxoplasmosis occurs in 0.28% to 0.45% of patients. Unlike solid organ transplant patients, most of these patients have reactivation, not primary disease.
- Inclusions:** Pulmonary toxoplasmosis
- 1F57.3 Eye disease due to *Toxoplasma gondii***  
Chorioretinitis or ocular toxoplasmosis is a relatively common manifestation of *T. gondii* infection. Ocular toxoplasmosis occurs when cysts deposited in or near the retina become active, producing tachyzoites. Focal necrotizing retinitis is the characteristic lesion, but retinal scars from prior reactivation are typically present.
- Inclusions:** Toxoplasma oculopathy
- 1F57.Y Other specified toxoplasmosis**
- 1F57.Z Toxoplasmosis, unspecified**
- 1F58 Microsporidiosis**
- 1F5Z Unspecified protozoal disease**

## Helminthiases (1F60-1F9Z)

**Coded Elsewhere:** Parasitic duodenitis (DA51.6Y)

## Diseases due to nematodes (1F60-1F6Z)

**1F60**

### **Angiostrongyliasis**

A disease caused by an infection with the parasitic worm *Angiostrongylus*. This disease commonly presents with fever, headache, stiffness of the neck and back, tingling or painful feelings in the skin, nausea and vomiting, or may be asymptomatic. Transmission is by ingestion of larvae in contaminated food.

**1F60.0**

### **Eosinophilic meningitis due to *Angiostrongylus cantonensis***

A disease of the meninges caused by an infection with *Angiostrongylus cantonensis*. This disease is characterised by fever, headache, stiffness of the neck, nausea, vomiting, muscular weakness, or paraesthesia. This disease may also present with abscesses, cerebral oedema, haemorrhage, diplopia, ataxia, or blindness. Transmission is by ingestion of infected undercooked snails, slugs, or transport hosts (such as frogs, fresh water shrimp, or land crabs). Confirmation is by identification of *Angiostrongylus cantonensis* from a cerebrospinal fluid sample, blood sample, or from a food history.

**1F60.1**

### **Intestinal angiostrongyliasis**

A disease of the intestines caused by an infection with the parasitic worm *Angiostrongylus costaricensis*. This disease is characterised by abdominal pain, fever, nausea, or vomiting. This disease may also present with intestinal obstruction or perforation. Transmission is by ingestion of infected undercooked slugs, or food contaminated by infected slugs or their slime. Confirmation is by identification of *Angiostrongylus costaricensis* from a cerebrospinal fluid sample, blood sample or from a food history.

**1F60.Y**

### **Other specified angiostrongyliasis**

**1F60.Z**

### **Angiostrongyliasis, unspecified**

**1F61**

### **Anisakiasis**

A disease caused by an infection with the parasitic worm *Anisakis*. This disease presents with severe abdominal pain, nausea, vomiting, or a hypersensitivity reaction. Transmission is by ingestion of undercooked contaminated fish or squid. Confirmation is by a history of consumption of undercooked fish or squid, or identification of *Anisakis* in the intestines or in a vomit sample.

**Inclusions:** Infection due to *Anisakis* larvae

**1F62**

### **Ascariasis**

A disease caused by an infection with the parasitic worm *Ascaris lumbricoides*. This disease presents with symptoms depending on the extent of the infection, ranging from asymptomatic to intestinal blockage. Transmission is by the faecal-oral route from the ingestion of *Ascaris* eggs in contaminated food or water. Confirmation is by identification of *Ascaris* eggs in a faecal sample.

**1F63**

### **Capillariasis**

**Coded Elsewhere:** Capillariasis due to Capillaria hepatica (DB90.0)

**1F63.0**

### **Capillariasis of the intestine**

A condition caused by an infection with the parasitic worm Capillaria philippinensis. This condition is characterised by abdominal pain, diarrhoea, nausea, vomiting, or weight loss. Transmission is by ingestion of infected undercooked fish, or autoinfection. Confirmation is by identification of Capillaria philippinensis in a tissue biopsy of the small intestines or faecal sample.

**Inclusions:** Capillariasis due to Capillaria hepatica (DB90.0)

**1F63.Y**

### **Other specified capillariasis**

**1F63.Z**

### **Capillariasis, unspecified**

**1F64**

### **Dracunculiasis**

A disease resulting from drinking water contaminated with water fleas infected with larvae of the nematode Dracunculus medinensis. It may take up to a year from ingestion of larvae for a mature gravid female worm to migrate to the skin and discharge immature larvae on contact with water. Dracunculiasis typically manifests as an intensely pruritic papule on a lower extremity from which part of the worm may emerge. Secondary pyogenic infection is common. This may be preceded by generalised symptoms such as fever, pruritus, urticaria and oedema.

**Inclusions:** Guinea worm infestation

**1F65**

### **Enterobiasis**

A disease of the intestine, caused by an infection with the parasitic worm Enterobius. This disease is characterised by inflammation of the anus, pruritus, rectal pain, or may be asymptomatic. Transmission is by the faecal-oral route or airborne transmission of the eggs from the parasitic worm. Confirmation is by identification of Enterobius eggs around the perianal region.

**Inclusions:** Pinworm infection

Threadworm infection

Oxyuriasis

**1F66**

### **Filariasis**

infections with nematodes of the superfamily Filarioidea; presence of living worms in the body is mainly asymptomatic but the death of adult worms leads to granulomatous inflammation and permanent fibrosis; organisms of the genus Elaeophora infect wild elk and domestic sheep causing ischaemic necrosis of the brain, blindness, and dermatosis of the face.

**Exclusions:** Onchocerciasis (1F6A)

- 1F66.0 Loiasis**  
A disease caused by an infection with the parasitic worm *Loa loa*. This disease is characterised by Calabar swellings found anywhere on the body (commonly found near joints). This disease may also present with generalised itching, muscle pain, joint pain, fatigue or may be asymptomatic. Transmission is through the bite of an infected fly (genus *Chrysops*). Confirmation is by identification of adult *Loa loa* in the skin or eye, *Loa loa* microfilariae in a blood sample obtained in the day (1000 - 1400), or detection of antibodies against *Loa loa* in a blood sample.
- Inclusions:**
- Eye worm disease of Africa
  - Loa loa* infestation
  - Calabar swelling
- 1F66.1 Mansoneliasis**  
A disease caused by an infection with the parasitic worm *Mansonella*. This disease is characterised by pruritus, dermal pigmentary changes, fever, or lymphadenopathy, or may be asymptomatic. Transmission is through the bite of an infected midge (genus *Culicoides*) or blackfly (genus *Simulium*). Confirmation is by identification of *Mansonella* microfilariae in a skin or blood sample.
- 1F66.2 Filariasis due to *Brugia* species**  
**Coded Elsewhere:** Filariasis due to *Brugia timori* (1F66.32)  
Filariasis due to *Brugia malayi* (1F66.31)
- 1F66.3 Lymphatic filariasis**  
Infestation by filarial nematodes of the genera *Wuchereria* and *Brugia*. It is acquired via transcutaneous injection of larvae by mosquitoes previously infested with microfilariae from the blood of a human host. The adult worms live in the lymphatics but release microfilariae into the bloodstream to complete the life cycle of the parasite. Clinical disease occurs in only a minority of those infected. In the acute stage this may present as an acute painful adenolymphangitis with fever. Chronic infestation causes progressive obstruction of lymphatic vessels and can result in disfiguring lymphoedema (elephantiasis), particularly of the genitalia and lower extremities.
- Exclusions:**
- Lymphoedema due to lymphatic filariasis (BD93.13)
- 1F66.30 Filariasis due to *Wuchereria bancrofti***  
This is a parasitic disease (usually an infectious tropical disease) that is caused by thread-like nematodes (roundworms) belonging to the superfamily *Filarioidea*, also known as "filariae".
- Inclusions:**
- Bancroftian filariasis
- 1F66.31 Filariasis due to *Brugia malayi***  
This is a parasitic disease (usually an infectious tropical disease) that is caused by thread-like nematodes (roundworms) belonging to the superfamily *Filarioidea*, also known as "filariae". This diagnosis is due to a nematode (roundworm), one of the three causative agents of lymphatic filariasis in humans.

- 1F66.32** Filariasis due to Brugia timori  
This is a parasitic disease (usually an infectious tropical disease) that is caused by thread-like nematodes (roundworms) belonging to the superfamily Filarioidea, also known as "filariae". This diagnosis is due to a human filarial parasitic nematode (roundworm) which causes the disease "Timor filariasis."
- 1F66.3Z** Lymphatic filariasis, unspecified
- 1F66.4** **Subcutaneous dirofilariasis**  
Subcutaneous dirofilariasis normally results from the transmission of microfilariae of *Dirofilaria repens* from the latter's natural animal host to man via a mosquito bite. The adult worm cannot develop fully in man but typically manifests as a subcutaneous nodule, commonly located on or around the eyelids.
- 1F66.Y** **Other specified filariasis**
- 1F66.Z** **Filariasis, unspecified**
- 1F67** **Gnathostomiasis**  
A disease caused by an infection with the parasitic worm *Gnathostoma*. This disease is characterised by painful, itchy swelling under the skin from movement of the parasite under the skin. This disease may also initially present with fever, lethargy, abdominal pain, vomiting, or diarrhoea, and may infect other parts of the body (lungs, bladder, eyes, ears, nervous system). Transmission is commonly by ingestion of undercooked contaminated freshwater fish, eels, frogs, birds, or reptiles, or ingestion of contaminated water. Confirmation is commonly by detection of antibodies against *Gnathostoma*, identification of migratory skin lesions, eosinophilia, and history of potential exposure.
- Inclusions:** Wandering swelling
- 1F68** **Hookworm diseases**  
A disease caused by an infection with the parasitic worm *Ancylostoma*. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, bloody diarrhoea, fatigue, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae), ingestion of larvae, or vertical transmission. Confirmation is by identification of *Ancylostoma* in a faecal sample.
- Inclusions:** Hook-worm infestation by *Ancylostoma*
- Coded Elsewhere:** Eosinophilic enteritis due to *Ancylostoma* (1F9Z)

**1F68.0**

### **Ancylostomiasis**

A disease caused by an infection with the parasitic hookworm *Ancylostoma duodenale*. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, bloody diarrhoea, fatigue, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae), ingestion of larvae, or vertical transmission. Confirmation is by identification of *Ancylostoma duodenale* in a faecal sample.

**1F68.1**

### **Necatoriasis**

A disease caused by an infection with the parasitic worm *Necator americanus*. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, arthralgia, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae). Confirmation is by identification of *Necator americanus* in a faecal sample.

**Inclusions:** Infection due to *Necator americanus*

**1F68.2**

### **Cutaneous larva migrans**

A disease caused by an infection with the parasitic worm larvae, commonly *Ancylostoma braziliense*, *A. caninum*, or *Uncinaria stenocephala*. This disease is characterised by intense pruritus and erythematous, serpiginous lesions due to migration of parasitic larvae in the upper dermis where the larvae penetrate the skin. Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae).

**1F69**

### **Oesophagostomiasis**

This refers to an inflammation of small intestine caused by infection due to a nematode called *Oesophagostomum bifurcum*.

**1F6A**

### **Onchocerciasis**

Any condition caused by an infection with the parasitic worm *Onchocerca volvulus*. These conditions are characterised by the presence of firm subcutaneous nodules filled with adult worms, pruritus, long-term corneal inflammation (keratitis), or thickening of the corneal stroma. If untreated, these infections will lead to blindness. Transmission is through the bite of an infected *Simulium* fly.

**1F6A.0**

### **Onchocerciasis of the eye**

A disease of the eye, caused by an infection with the parasitic worm *Onchocerca volvulus*. This disease is characterised by transient punctate keratitis, or potentially blinding conditions (such as sclerosing keratitis, iridocyclitis, or optic atrophy). Transmission is through the bite of an infected *Simulium* fly. Confirmation is by identification of *Onchocerca volvulus* from the anterior chamber of the eye.

**Inclusions:** Ocular onchocerciasis

- 1F6A.1** **Onchocerciasis of the skin**  
A disease of the skin, caused by an infection with the parasitic worm *Onchocerca volvulus*. This disease is characterised by subcutaneous nodules on the skin (commonly affecting the iliac crests, ribs, knees, or trochanters). Transmission is through the bite of an infected *Simulium* fly. Confirmation is by identification of *Onchocerca volvulus* in a skin sample.
- Inclusions:** Cutaneous onchocerciasis
- 1F6A.Y** **Other specified onchocerciasis**
- 1F6A.Z** **Onchocerciasis, unspecified**
- 1F6B** **Strongyloidiasis**  
A disease caused by the parasitic worm *Strongyloides*. This disease presents with symptoms depending on the site of infection (gastrointestinal tract, pulmonary system, dermis, or systemic), or may be asymptomatic. Transmission is by direct contact through penetration of the skin (generally the feet) with larvae from faecally contaminated soil, or autoinfection of an established infection. Confirmation is by identification of *Strongyloides* larvae in faecal samples, duodenal fluid samples, sputum, pleural fluid, or tissue samples.
- Exclusions:** Trichostrongyliasis (1F6F)
- 1F6C** **Syngamosis**  
A disease caused by an infection with the parasitic worm *Mammomonogamus*. This disease is characterised by chronic nonproductive cough, crawling sensation in the throat, wheezing, or difficulties breathing. Transmission may be by ingestion of adult worms or eggs in contaminated food or water. Confirmation is by identification of adult *Mammomonogamus* by direct visualization, or identification of *Mammomonogamus* eggs in sputum or faecal samples.
- 1F6D** **Toxocariasis**  
A condition caused by an infection with the parasitic worm *Toxocara*. In ocular infections, this condition is characterised by vision loss or inflammation of the eye; in visceral infections, this condition is characterised by fever, coughing, enlarged liver, or pneumonia. This condition may also be asymptomatic. Transmission is by the faecal-oral route through the ingestion of food, water, or soil that contains *Toxocara* eggs (contaminated by faeces from an infected dog or cat). Confirmation is by detection of antibodies against *Toxocara* in a blood sample.
- Inclusions:** Toxocara infestation
- 1F6E** **Trichinosis**  
A disease caused by an infection with the parasitic worm *Trichinella*. This disease is characterised by fever, nausea, diarrhoea, vomiting, fatigue, or abdominal discomfort. This disease may also present with headache, chills, cough, swelling of the face and eyes, or aching joints and muscle pains. Transmission is by ingestion of contaminated meat. Confirmation is by detection of antibodies against *Trichinella* in a blood sample.

**1F6F****Trichostrongyliasis**

A disease caused by an infection with the parasitic worm Trichostrongylus. This disease is characterised by abdominal pain, diarrhoea, weight loss, or may be asymptomatic. Transmission is by ingestion of contaminated food or water. Confirmation is by identification of Trichostrongylus eggs in a faecal sample.

**1F6G****Trichuriasis**

A disease of the small intestine, caused by an infection with the parasitic worm Trichuris trichiura. This disease is commonly asymptomatic. This disease may also present with painful diarrhoea (containing a mixture of mucus, water, or blood). Transmission is by the faecal-oral route. Confirmation is by identification of Trichuris trichiura eggs in a faecal sample.

**Inclusions:** Trichocephaliasis

**1F6H****Uncinariasis**

A disease caused by an infection with the parasitic worm Uncinaria stenocephala. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, arthralgia, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae). Confirmation is by identification of Uncinaria stenocephala in a faecal sample.

**1F6Y****Other specified diseases due to nematodes****1F6Z****Diseases due to nematodes, unspecified****Diseases due to cestodes (1F70-1F7Z)****1F70****Cysticercosis**

A disease caused by an infection of tissue with larval cysts from the parasitic worm Taenia solium. This disease presents with symptoms depending on the site of infection (central nervous system, eye, or muscle). Transmission is through haematogenous spread of larvae to affected tissue after ingestion of Taenia solium eggs (or proglottids) in contaminated food or water. Confirmation is commonly by detection of antibodies against Taenia solium in a blood sample, cerebrospinal fluid, or faeces, and by advanced imaging of affected tissue.

**Inclusions:** cysticerciasis infection due to larval form of Taenia solium

**Coded Elsewhere:** Encephalitis due to cysticercosis (1F70.0Y)

Cysticercosis of orbit (9A21.Y)

- 1F70.0** **Cysticercosis of central nervous system**  
A disease of the central nervous system, caused by an infection of tissue with larval cysts from the parasitic worm *Taenia solium*. This disease presents with symptoms depending on the site of infection, the number and size of cysts, and the individual's immune status. This disease may present with epilepsy, chronic headache, hydrocephalus, neurological deficits, or may be asymptomatic. Transmission is by haematogenous spread of larvae to the central nervous system after ingestion of *Taenia solium* eggs in contaminated food or water. Confirmation is by detection of antibodies against *Taenia solium* in a blood sample, or cerebrospinal fluid and advanced imaging of the brain.
- 1F70.00** Meningitis due to Cysticercosis  
A disease of the meninges, caused by an infection with larval cysts from the parasitic worm *Taenia solium*. This disease is characterised by headache, fever, seizures, or neurological deficits. Transmission is through hematogenous spread of larvae to the meninges after ingestion of *Taenia solium* eggs (or proglottids) in contaminated food or water. Confirmation is by advanced imaging and detection of antibodies against *Taenia solium* from serum or cerebrospinal fluid.
- 1F70.0Y** Other specified cysticercosis of central nervous system
- 1F70.1** **Cysticercosis of eye**  
A disease of the eye, caused by an infection of tissue with larval cysts from the parasitic worm *Taenia solium*. This disease is characterised by cysts floating in the vitreous humour of the eye leading to impaired vision. Transmission is by haematogenous spread of larvae to the eye after ingestion of *Taenia solium* eggs in contaminated food or water. Confirmation is commonly by history of travel in parasite endemic regions and advanced imaging of the eye.
- 1F70.Y** Other specified cysticercosis
- 1F70.Z** Cysticercosis, unspecified
- 1F71** **Diphyllobothriasis**  
A disease caused by an infection with the parasitic worm *Diphyllobothrium*. This disease is characterised by abdominal discomfort, diarrhoea, vomiting, or weight loss. This disease may be asymptomatic. Transmission is by ingestion of infected undercooked fish. Confirmation is by identification of *Diphyllobothriasis* eggs in a faecal sample.  
*Inclusions:* larval diphyllobothriasis (1F75)
- 1F72** **Dipylidiasis**  
A condition caused by an infection with the parasitic worm *Dipylidium caninum*. This condition is commonly present with abdominal pain, diarrhoea, anal pruritus, or may be asymptomatic. Transmission is by ingestion of an infected flea. Confirmation is by identification of *Dipylidium caninum* eggs in a faecal sample.
- 1F73** **Echinococcosis**  
*Inclusions:* Hydatidosis
- 1F73.0** **Echinococcus infection of liver**

- 1F73.1**      **Echinococcus infection of lung**
- 1F73.2**      **Echinococcus infection of bone**
- 1F73.3**      **Echinococcus infection of central nervous system**
- 1F73.Y**      **Other specified echinococcosis**
- 1F73.Z**      **Echinococcosis, unspecified**

**1F74**

**Hymenolepiasis**

A disease caused by an infection with the parasitic worm Hymenolepis. This disease is commonly asymptomatic. This disease may present with nausea, weakness, abdominal pain, diarrhoea, or vomiting. Transmission is by the ingestion of eggs commonly in contaminated food or water, or ingestion of infected arthropods. Confirmation is by identification of Hymenolepis eggs in a faecal sample.

**1F75**

**Sparganosis**

A disease caused by an infection with the parasitic worm Spirometra. This disease presents with symptoms depending on the site of the infection. Transmission is by ingestion of contaminated water or ingestion of infected undercooked second intermediate hosts (such as fish, reptiles or amphibians). Confirmation is by identification of Spirometra eggs in a faecal sample.

**Inclusions:**      Larval diphyllobothriasis  
                          Spirometrosis

**1F76**

**Taeniasis**

A disease of the intestines, caused by an infection with the adult parasitic worm Taenia. This disease is characterised by abdominal pain, weight loss, diarrhoea, constipation, or may be asymptomatic. Transmission is by ingestion of larval cysts in undercooked beef or pork. Confirmation is by identification of Taenia eggs or proglottids in faecal samples (samples from multiple days).

**Exclusions:**      Cysticercosis (1F70)

**1F76.0**

**Taeniasis due to Taenia solium**

A disease of the intestines, caused by an infection with the adult parasitic worm Taenia solium. This disease is characterised by abdominal pain, weight loss, diarrhoea, constipation, or may be asymptomatic. Transmission is by ingestion of larval cysts in undercooked pork. Confirmation is by identification of Taenia solium eggs or proglottids in faecal samples (samples from multiple days).

**Inclusions:**      Taenia solium taeniasis

<b>1F76.1</b>	<b>Taeniasis due to <i>Taenia saginata</i></b>
	A disease of the intestines, caused by an infection with the adult parasitic worm <i>Taenia saginata</i> . This disease is characterised by abdominal pain, weight loss, diarrhoea, constipation, or may be asymptomatic. Transmission is by ingestion of larval cysts in undercooked beef. Confirmation is by identification of <i>Taenia saginata</i> eggs or proglottids in faecal samples (samples from multiple days).
	<b>Inclusions:</b> Infection due to adult tapeworm <i>Taenia saginata</i>
	<i>Taenia saginata</i> taeniasis
<b>1F76.Y</b>	<b>Other specified taeniasis</b>
<b>1F76.Z</b>	<b>Taeniasis, unspecified</b>
<b>1F7Y</b>	<b>Other specified diseases due to cestodes</b>
<b>1F7Z</b>	<b>Diseases due to cestodes, unspecified</b>

### Diseases due to trematodes (1F80-1F8Z)

<b>1F80</b>	<b>Clonorchiasis</b>
	A condition caused by an infection with the parasitic worm <i>Clonorchis sinensis</i> . This condition commonly presents with inflammation and obstruction of the biliary ducts. This condition may also present with abdominal pain, nausea, or diarrhoea. Transmission is commonly by ingestion of undercooked fish infected with parasitic cysts. Confirmation is by identification of <i>Clonorchis sinensis</i> eggs in a faecal sample.
	<b>Inclusions:</b> Chinese liver fluke disease
	Oriental liver fluke disease
	Infection due to <i>Clonorchis sinensis</i>
<b>1F81</b>	<b>Dicrocoeliasis</b>
	A disease caused by an infection with the parasitic worm <i>Dicrocoelium dendriticum</i> . This disease is commonly asymptomatic. This disease may present with cholecystitis, liver abscesses, or upper abdominal pain. Transmission is by ingestion of infected ants. Confirmation is by identification of <i>Dicrocoelium dendriticum</i> eggs in a faecal sample or duodenal fluid.
	<b>Inclusions:</b> Lancet fluke infection

**1F82**

### **Fascioliasis**

A disease of the hepatic system, caused by an infection with the parasitic worm *Fasciola*. In the acute phase, this disease is characterised by upper abdominal pain, fever, urticaria, shortness of breath, nausea, or vomiting due to migration of the parasite from the intestines to the liver. In the chronic phase, this disease is characterised by cholestasis, cholangitis, pancreatitis, or gallstones. This disease may be asymptomatic. Transmission is by ingestion of undercooked contaminated aquatic plants or contaminated water. Confirmation is commonly by identification of *Fasciola* eggs in a faecal sample (after the individual has followed a liver-free diet prior to testing), or detection of antibodies against *Fasciola*.

**Inclusions:**      Sheep liver fluke disease

**1F83**

### **Fasciolopsiasis**

A disease caused by an infection with the parasitic worm *Fasciolopsis buski*. This disease is characterised by abdominal pain or diarrhoea, or may be asymptomatic. This disease may also present with oedema of the face, abdomen, or legs, vomiting, anorexia, or intestinal obstruction. Transmission is by ingestion of undercooked contaminated aquatic plants. Confirmation is by identification of *Fasciolopsis buski* eggs in a faecal sample.

**1F84**

### **Opisthorchiasis**

A disease caused by an infection with the parasitic worm *Opisthorchis*. This disease is commonly asymptomatic. In mild cases, this disease may present with dyspepsia, abdominal pain, diarrhoea, or constipation; in severe cases, this disease may present with hepatomegaly and malnutrition; in rare cases, this disease may present with cholangitis, cholecystitis, and cholangiocarcinoma. Transmission is by ingestion of infected undercooked freshwater fish. Confirmation is by identification of *Opisthorchis* in a faecal sample.

**1F85**

### **Paragonimiasis**

A disease caused by an infection with the parasitic worm *Paragonimus*. This disease is characterised by cough or haemoptysis, or may be asymptomatic. This disease may present with other symptoms depending on the site where the parasite migrates to. Transmission is commonly by ingestion of undercooked contaminated crustaceans (crab or crayfish). Confirmation is commonly by identification of *Paragonimus* eggs in a sputum or faecal sample.

**Inclusions:**      lung fluke disease  
                        infection due to *paragonimus* species  
                        Infestation due to *Paragonimus* species

**1F86**

### **Schistosomiasis**

An infestation caused by helminths of the genus *Schistosoma*. The clinical features vary according to the species involved but the principal organs affected are the gastrointestinal tract and bladder.

**Inclusions:**      snail fever

- 1F86.0 Schistosomiasis due to *Schistosoma haematobium***  
A disease caused by an infection with the parasitic worm *Schistosoma haematobium*. This disease is characterised by haematuria, scarring, calcification, or squamous cell carcinoma. This disease may also present with embolic egg granulomas in the brain or spinal cord. Transmission is by direct contact with freshwater that has been contaminated with *Schistosoma haematobium* eggs or snails that carry *Schistosoma haematobium*.
- 1F86.1 Schistosomiasis due to *Schistosoma mansoni***  
A disease caused by an infection with the parasitic worm *Schistosoma mansoni*. This disease commonly presents with Katayama fever, hepatic perisinusoidal egg granulomas, Symmers' pipe stem periportal fibrosis, or portal hypertension. This disease may also present with embolic egg granulomas in the brain or spinal cord. Transmission is by direct contact with freshwater that has been contaminated with *Schistosoma mansoni* eggs or snails that carry *Schistosoma mansoni*. Confirmation is by identification of the *Schistosoma mansoni* eggs in a faecal sample.
- 1F86.2 Schistosomiasis due to *Schistosoma japonicum***  
A disease caused by an infection with the parasitic worm *Schistosoma japonicum*. This disease is characterised by Katayama fever, hepatic perisinusoidal egg granulomas, Symmers' pipe stem periportal fibrosis, or portal hypertension. This disease may also present with embolic egg granulomas in the brain or spinal cord. Transmission is by direct contact with freshwater that has been contaminated with *Schistosoma japonicum* eggs or snails that carry *Schistosoma japonicum*. Confirmation is by identification of the *Schistosoma japonicum* eggs in a faecal sample.
- Inclusions:** Asiatic schistosomiasis
- 1F86.3 Other schistosomiases**
- 1F86.4 Cercarial dermatitis**  
A disease caused by an infection with the parasitic worm *Schistosoma*. This disease is characterised by tingling, burning, itching of the skin, small reddish pimples, or small blisters. Transmission is by direct contact with contaminated water. Confirmation is by identification of *Schistosoma* eggs in a faecal, urine, or blood sample.
- 1F86.5 Schistosomal pneumonitis**
- 1F86.Z Schistosomiasis due to unspecified or unknown *Schistosoma* species**
- 1F8Y Other specified diseases due to trematodes**
- 1F8Z Diseases due to trematodes, unspecified**
- 1F90 Other and unspecified infestation by parasitic worms**
- 1F90.0 Mixed intestinal helminthiases**
- 1F90.1 Intestinal parasitic infestation not otherwise specified**  
This concept should be used for parasitic infestation of the intestine only when no more precise details are available.

- 1F90.2** **Intestinal helminthiasis, unspecified**
- 1F90.Y** **Other specified other and unspecified infestation by parasitic worms**
- 1F90.Z** **Other and unspecified infestation by parasitic worms, unspecified**
- 1F91** **Diphyllobothriasis and sparganosis**  
Diphyllobothriasis is defined as infection with the cestode *Diphyllobothrium latum* or other *Diphyllobothrium* species, which occurs accidentally in humans who ingest water containing infected cyclops, eating raw or inadequately cooked flesh. Manifestations may include abdominal discomfort, diarrhoea, vomiting and megaloblastic anaemia. Massive infections may result in intestinal obstruction.
- 1F9Z** **Helminthiases, unspecified**  
Infestations by ectoparasites (1G00-1G0Z)  
Diseases caused by parasitic organisms which normally live on the surface of the host.  
**Coded Elsewhere:** Epidemic louse-borne typhus fever due to *Rickettsia prowazekii* (1C30.0)  
    Recrudescence typhus (1C30.1)
- 1G00** **Pediculosis**  
A condition of the skin, hair, or genital region caused by an infection with the parasite *Pediculus*. This disease is characterised by pruritus. This condition also presents with symptoms depending on the site of infection. Transmission is by direct or indirect contact with an infected individual or animal. Confirmation is by identification of *Pediculus*.
- 1G00.0** **Pediculosis capitis**  
A condition of the scalp and hair shaft, caused by an infection with the parasite *Pediculus humanus capitis*. This condition is characterised by pruritus which may lead to sores or thickened discoloured skin. Transmission is by direct or indirect contact with an infected individual or animal. Confirmation is by identification of *Pediculus humanus capitis* eggs or *Pediculus humanus capitis*.
- 1G00.1** **Pediculosis corporis**  
A condition of the skin, caused by an infection with the parasite *Pediculus humanus corporis*. This condition is characterised by pruritus which may lead to sores or thickened discoloured skin. Transmission is by direct or indirect contact with an infected individual or animal. Confirmation is by identification of *Pediculus humanus corporis* eggs or *Pediculus humanus corporis*.
- 1G00.Z** **Pediculosis of unspecified site or type**

**1G01****Myiasis**

A disease of the tissues, caused by an infection with fly larvae from the order Diptera. This disease is characterised by a lump developing in the tissue. Transmission is by ingestion of contaminated larvae, direct contact with an infected mosquito, tick, fly, or indirect contact with infected fly eggs. Confirmation is by identification of Diptera from a tissue sample.

**Inclusions:** infestation by larvae of flies

**1G01.0****Ocular myiasis**

A disease of the eye, caused by an infection with fly larvae from the order Diptera. This disease is characterised by a lump developing in the tissue. Transmission is by ingestion of contaminated larvae, direct contact with an infected mosquito, tick, fly, or indirect contact with infected fly eggs. Confirmation is by identification of Diptera.

**1G01.1****Nasopharyngeal myiasis****1G01.2****Laryngeal myiasis****1G01.3****Cutaneous myiasis**

The infestation of the skin or subcutaneous tissues by the larvae of certain flies (*Phormia regina*, *Cordylobia anthropophaga*, *Cochliomyia hominivorax*, *C. macellaria*, *Wohlfahrtia vigil*, *W. meigeni*, *W. opaca*, *Dermatobia hominis*, *Sarcophaga krameri*), characterised by a painful boil-like lesion containing one or more larvae with severe pruritus and local destruction of tissue.

**1G01.Y****Other specified myiasis****1G01.Z****Myiasis, unspecified****1G02****External hirudiniasis**

Infestation of the skin by leeches. Sensitisation to antigenic substances deposited in the skin can result in urticarial weals and bullae.

**Exclusions:** Internal hirudiniasis (1F60-1F9Z)

**1G03****Pthiriasis**

Infestation most commonly of pubic hair and less commonly of body hair or eyelashes by the crab louse, *Pthirus pubis*. Transmission is by direct, typically sexual contact with an infected individual. Confirmation is by identification of *Pthirus pubis* or its eggs.

**Inclusions:** Infestation by crab lice

**1G04****Scabies**

A highly contagious infestation of the skin by the mite *Sarcoptes scabiei* var. *hominis*. It may result in epidemics when introduced into institutions such as schools and nursing homes. The mites burrow into the skin, favouring the extremities, genitalia and, in infants, the axillae. The characteristic widespread intensely pruritic papulovesicular rash results largely from the host response rather than directly to burrowing by mites. Where such a response is absent as in immunosuppressed or debilitated patients, unchecked proliferation of mites results in crusted scabies. Sarcoptic mites from other mammals such as dogs may cause a transient pruritic eruption.

**1G04.0****Classical scabies****1G04.1****Crusted scabies**

Crusted scabies results from unchecked proliferation of the human scabies mite in individuals who are unable to mount an adequate immune response to infestation. Extensive thick crusts containing vast numbers of mites form over the skin, particularly of the extremities. Because itching is usually absent, the diagnosis is frequently overlooked. Patients with crusted scabies may serve as the source for widespread outbreaks of scabies in institutions such as hospitals and care homes.

**1G04.Y****Other and unspecified scabies****1G05****Tungiasis**

A disease of the skin, caused by an infection with the parasite *Tunga penetrans*. This disease is characterised by lesions (white patch with a black dot in the middle), skin inflammation, or pruritus surrounding the lesion. This disease may also be asymptomatic. Transmission is through the bite of an infected flea, or by direct contact with an infected animal. Confirmation is by identification of *Tunga penetrans* or travel history.

**1G06****Cimicosis**

Infestation by bedbugs, which are blood-sucking temporary ectoparasites. The most common species to attack humans is *Cimex lectularius*. In individuals who are not sensitized by previous exposure, there may be no symptoms or signs other than purpuric macules at the sites of bites. Weals, papules or bullae may occur in sensitized individuals.

**1G07****Infestation by mites**

**Coded Elsewhere:** Scabies (1G04)

Cutaneous reactions to zoonotic mites (NE61)

**1G07.0****Infestation by Demodex**

Infestation with *Demodex* mites. *Demodex folliculorum* is a saprophytic mite of the human pilosebaceous unit with a predilection for facial skin and eyelashes. *Demodex brevis* is found in the sebaceous glands of the eyelash follicle and in the lobules of eyelid meibomian glands. Although infestation is very common and normally symptomless, the mites have been linked to papulopustular rosacea and chronic blepharitis.

**1G07.Y****Infestation of the skin by other specified parasitic mites**

<b>1G0Y</b>	<b>Infestation by other specified ectoparasite</b>
<b>1G0Z</b>	<b>Infestation by unknown or unspecified ectoparasite</b>
<b>1G2Y</b>	<b>Other specified parasitic diseases</b>
<b>1G2Z</b>	<b>Unspecified parasitic diseases</b>

## Sepsis (1G40-1G41)

**Coding Note:** Any type of infection - bacterial, viral, fungal or protozoal, can cause sepsis and must be coded as well. When the site of infection is unknown, select a code for Infection of unspecified site by organism followed by the appropriate code for sepsis.

- Exclusions:**
- Plague (1B93)
  - Acute or fulminant melioidosis (1C42)
  - Tularaemia (1B94)
  - Other infection during labour (JB0D)
  - Injury or harm arising following infusion, transfusion or therapeutic injection, not elsewhere classified (NE80)
  - Genital tract or pelvic infection following abortion, ectopic or molar pregnancy (JA05.0)
  - Disseminated gonococcal infection (1A73)
  - Extraintestinal yersiniosis (1B9A)
  - Injury or harm arising from a procedure, not elsewhere classified (NE81)
  - Meningococcal disease (1C1C)
  - Systemic inflammatory response syndrome of noninfectious origin (MG46)

**Coded Elsewhere:** Puerperal sepsis (JB40.0)

- Sepsis of fetus or newborn (KA60)
- Obstetric pyaemic or septic embolism (JB42.3)

**1G40**

### **Sepsis without septic shock**

Sepsis is defined as a life-threatening organ dysfunction caused by a dysregulated host response to infection.

**Coding Note:** Any type of infection - bacterial, viral, fungal or protozoal, can cause sepsis and must be coded as well. When the site of infection is unknown, select a code for Infection of unspecified site by organism followed by the appropriate code for sepsis.

- Exclusions:**
- Septicaemia (MA15.0)
  - Sepsis of fetus or newborn (KA60)

**1G41**

### **Sepsis with septic shock**

Septic shock is a subset of sepsis in which circulatory, cellular and metabolic abnormalities are profound enough to substantially increase mortality.

**Coding Note:**

Any type of infection - bacterial, viral, fungal or protozoal, can cause sepsis and must be coded as well. When the site of infection is unknown, select a code for Infection of unspecified site by organism followed by the appropriate code for sepsis.

**Exclusions:**      Sepsis of fetus or newborn (KA60)  
                         Septicaemia (MA15.0)

**1G60**

### **Certain other disorders of infectious origin**

Miscellaneous disorders of infectious origin not classifiable elsewhere including those due to algae and oomycetes

**1G60.0**

#### **Mycetoma of unknown or unspecified type**

Mycetoma is a destructive localised chronic infection of skin, subcutaneous tissue and bone, most commonly affecting the foot. It can be caused by either fungi (eumycetoma) or filamentous bacteria (actinomycetoma). Where possible it should be classified more precisely as either actinomycetoma, the commonest type, or eumycetoma

**Exclusions:**      Actinomycetoma (1C43)  
                         Eumycetoma (1F29)

**1G60.1**

#### **Pythiosis**

Pythiosis is a life-threatening infection by the oomycete *Pythium insidiosum*. Although infection in animals occurs widely across the world, human pythiosis is largely confined to Thailand and, with the exception of ocular disease, is closely associated with underlying haematological disease, especially thalassaemia. There is a high mortality in patients with disseminated or vascular disease. In the latter form, invasion of arterial wall results in vascular occlusion and a frequent need for amputation. Patients with ocular pythiosis commonly require enucleation. A small proportion of infections are limited to the skin and subcutaneous tissues.

**1G60.2**

#### **Protothecosis**

Protothecosis is a rare opportunistic infection in humans caused by achloric algae of the genus *Prototheca*. The infection is usually localised and may be associated with antecedent local trauma. It is generally located on exposed sites and remains confined to skin and subcutaneous tissues. In immunocompromised patients, however, widespread cutaneous, subcutaneous or deep infection may occur.

**1G60.Y**

#### **Other specified disorders of infectious origin not elsewhere classified**

## **Sequelae of infectious diseases (1G80-1G8Y)**

A sequela is a chronic condition resulting from an acute condition and begins during that acute condition. The acute condition is no longer present. The sequela continues after the acute phase of the condition is resolved. For infectious diseases, the original infection is no longer present.

The sequelae categories indicate infections as the cause of sequelae which are themselves classified elsewhere.

Not to be used for chronic infections. Code the chronic infection to chronic or active infectious disease as appropriate.

Use an additional code, if desired, to identify the specific sequelae.

**Coded Elsewhere:** Sequelae of inflammatory diseases of central nervous system (1D0Y)

**1G80**

### **Sequelae of tuberculosis**

Sequela of tuberculosis is a chronic condition resulting from acute tuberculosis. *Mycobacterium tuberculosis* is no longer active. The sequela continues after the acute phase is resolved.

**1G81**

### **Sequelae of trachoma**

This refers to a pathological condition resulting from an infectious disease caused by the *Chlamydia trachomatis* bacterium which produces a characteristic roughening of the inner surface of the eyelids.

**1G82**

### **Sequelae of leprosy**

This refers to a pathological condition resulting from a chronic disease caused by the bacteria *Mycobacterium leprae* and *Mycobacterium lepromatosis*.

**1G83**

### **Sequelae of poliomyelitis**

Sequelae of poliomyelitis refers to the residuals of acute poliomyelitis as well as other disorders that have an etiological link to either the acute polio infection or to chronic deficits resulting from the acute infection. Disorders that may manifest late in the lives of polio survivors include early advanced degenerative arthritis, sleep disorders, respiratory insufficiency, and a variety of mental disorders.

**Exclusions:** Post polio progressive muscular atrophy (8B62)

**1G84**

### **Sequelae of viral encephalitis**

**1G85**

### **Sequelae of diphtheria**

This refers to conditions that develop as a consequence of a bacterial infection of the respiratory tract with *Corynebacterium diphtheriae*.

**1G8Y**

### **Sequelae of other specified infectious diseases**

**1H0Z**

### **Infection, unspecified**

# CHAPTER 02

---

## Neoplasms

This chapter has 325 four-character categories.

Code range starts with 2A00

An abnormal or uncontrolled cellular proliferation which is not coordinated with an organism's requirements for normal tissue growth, replacement or repair.

**Coded Elsewhere:** Inherited cancer-predisposing syndromes

This chapter contains the following top level blocks:

- Neoplasms of brain or central nervous system
- Neoplasms of haematopoietic or lymphoid tissues
- Malignant neoplasms, except primary neoplasms of lymphoid, haematopoietic, central nervous system or related tissues
- In situ neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues
- Benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues
- Neoplasms of uncertain behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues
- Neoplasms of unknown behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues
- Inherited cancer-predisposing syndromes

### Neoplasms of brain or central nervous system (2A00-2A0Z)

A benign or malignant neoplasm that affects the brain, meninges, or spinal cord. Representative examples of primary neoplasms include astrocytoma, oligodendrogloma, ependymoma, and meningioma.

<b>2A00</b>	<b>Primary neoplasms of brain</b>
<b>2A00.0</b>	<b>Gliomas of brain</b>
<b>2A00.00</b>	Glioblastoma of brain  Glioblastomas are malignant astrocytic tumours (grade IV according to the WHO classification). They represent the most frequent brain tumours in adults. They may occur at any age, but 70% of cases are seen in patients between 45 and 70 years of age. The tumours are usually located in the brain hemispheres, but can be found anywhere in the central nervous system.
	<b>Inclusions:</b> glioblastoma NOS
<b>2A00.0Y</b>	Other specified gliomas of brain

- 2A00.0Z** Gliomas of brain, unspecified
- 2A00.1** **Embryonal tumours of brain**
- 2A00.10** Medulloblastoma of brain  
A malignant, invasive embryonal neoplasm arising from the cerebellum. It occurs predominantly in children and has the tendency to metastasize via the cerebrospinal fluid pathways. Signs and symptoms include truncal ataxia, disturbed gait, lethargy, headache, and vomiting. There are four histologic variants: anaplastic medulloblastoma, desmoplastic/nodular medulloblastoma, large cell medulloblastoma, and medulloblastoma with extensive nodularity.
- 2A00.11** Central primitive neuroectodermal tumour  
A malignant neoplasm that originates in the neuroectoderm. The neuroectoderm constitutes the portion of the ectoderm of the early embryo that gives rise to the central and peripheral nervous systems and includes some glial cell precursors.
- 2A00.1Y** Other specified embryonal tumours of brain
- 2A00.1Z** Embryonal tumours of brain, unspecified
- 2A00.2** **Tumours of neuroepithelial tissue of brain**
- 2A00.20** Tumours of the pineal gland or pineal region
- 2A00.21** Mixed neuronal-glial tumours
- 2A00.22** Choroid plexus tumours
- 2A00.2Y** Other specified tumours of neuroepithelial tissue of brain
- 2A00.2Z** Tumours of neuroepithelial tissue of brain, unspecified
- 2A00.3** **Central neurocytoma of brain**  
Central neurocytoma is a very rare brain tumour of young adults. It is typically found in the lateral ventricles and occasionally in the third ventricle. Symptoms are those of increased intracranial pressure.
- 2A00.4** **Astroblastoma of the brain**  
A rare glial neoplasm more commonly found in young adults. It is characterised by tumour cells with characteristics suggestive of an astrocytic origin (positive for GFAP), arranged perivascularly. The cells have broad, non-tapering processes radiating towards a central blood vessel. The biologic behaviour of astroblastomas is variable, so no WHO grade has been established, yet.
- 2A00.5** **Primary neoplasm of brain of unknown or unspecified type**
- 2A01** **Primary neoplasms of meninges**
- 2A01.0** **Meningiomas**
- 2A01.00** Primary malignant meningioma

## Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

A neoplasm arising from hematopoietic cells found in the bone marrow, peripheral blood, lymph nodes and spleen (organs of the hematopoietic system). Hematopoietic cell neoplasms can also involve other anatomic sites (e.g. central nervous system, gastrointestinal tract), either by haematogenous spread, direct tumour infiltration, or neoplastic transformation of extranodal lymphoid tissues. The commonest forms are the various types of leukaemia, Hodgkin and non-Hodgkin lymphomas, myeloproliferative neoplasms and myelodysplastic syndromes.

### Myeloproliferative neoplasms (2A20-2A22)

<b>2A20</b>	<b>Non mast cell myeloproliferative neoplasms</b>
	<b>Coded Elsewhere:</b> Acquired thrombocytosis (3B63.1)
<b>2A20.0</b>	<b>Chronic myelogenous leukaemia, BCR-ABL1-positive</b>
	<b>Inclusions:</b> Atypical chronic myeloid leukaemia, BCR-ABL1-negative (2A41)
	Chronic myelomonocytic leukaemia (2A40)
	Other and unspecified myeloproliferative neoplasms (2A22)
	Chronic myeloid leukaemia, not elsewhere classified (2B33.2)
<b>2A20.00</b>	Chronic myelogenous leukaemia with blast crisis
<b>2A20.01</b>	Chronic myelogenous leukaemia, Philadelphia chromosome (Ph1) positive
<b>2A20.02</b>	Chronic myelogenous leukaemia, t(9;22)(q34; q11)
<b>2A20.03</b>	Naegeli-type monocytic leukaemia
<b>2A20.0Y</b>	Other specified chronic myelogenous leukaemia, BCR-ABL1-positive
<b>2A20.0Z</b>	Chronic myelogenous leukaemia, BCR-ABL1-positive, unspecified
<b>2A20.1</b>	<b>Chronic neutrophilic leukaemia</b>
	A rare chronic myeloproliferative neoplasm characterised by sustained peripheral blood neutrophilia, bone marrow hypercellularity due to neutrophilic granulocyte proliferation, and hepatosplenomegaly. The neutrophils lack dysplasia and often show toxic granulations. There is no detectable Philadelphia chromosome or BCR/ABL1 fusion gene.
<b>2A20.2</b>	<b>Primary myelofibrosis</b>
	<b>Inclusions:</b> chronic idiopathic myelofibrosis
	<b>Exclusions:</b> Acute panmyelosis with myelofibrosis (2A60.38)
<b>2A20.3</b>	<b>Chronic eosinophilic leukaemia, not elsewhere classified</b>
	A chronic myeloproliferative neoplasm characterised by persistent eosinophilia in the blood, bone marrow and peripheral tissues. Organ damage occurs as a result of leukaemic infiltration or the release of cytokines, enzymes or other proteins by the eosinophils. Chronic eosinophilic leukaemia, not otherwise specified excludes patients with a Ph chromosome, BCR-ABL1 fusion gene or rearrangement of PDGFRA, PDGFRB or FGFR1.

<b>2A20.4</b>	<b>Polycythaemia vera</b>
<b>2A20.5</b>	<b>Non mast cell myeloproliferative neoplasm, unclassifiable</b> Cases that have definite features of myeloproliferative neoplasms (MPN), but fail to meet the criteria of a specific MPN subtype.
<b>2A20.Y</b>	<b>Other specified non mast cell myeloproliferative neoplasms</b>
<b>2A20.Z</b>	<b>Non mast cell myeloproliferative neoplasms, unspecified</b>
<b>2A21</b>	<p><b>Mastocytosis</b></p> <p>Mastocytosis is due to a clonal, neoplastic proliferation of mast cells that accumulate in one or more organ systems. Activating mutations of KIT are frequently found. It is characterised by the presence of multifocal compact clusters or cohesive aggregates/infiltrates of abnormal mast cells. The disorder is heterogeneous, ranging from skin lesions that may spontaneously regress to highly aggressive neoplasms associated with multiorgan failure and short survival. Subtypes of mastocytosis are recognised mainly by the distribution of the disease and clinical manifestations. In cutaneous mastocytosis (CM), the mast cell infiltration remains confined to the skin, whereas systemic mastocytosis (SM) is characterised by involvement of at least one extracutaneous organ with or without evidence of skin lesions. Mastocytosis should be strictly separated from mast cell hyperplasia or mast cell activation states without morphological and/or molecular abnormalities that characterize the neoplastic proliferation.</p>
<b>2A21.0</b>	<p><b>Systemic mastocytosis</b></p> <p>Systemic mastocytosis (SM) comprises a heterogeneous group of rare acquired and chronic haematological malignancies that are related to an abnormal proliferation of mast cells in tissue, including bone marrow, with or without skin involvement. SM can be divided into indolent SM (ISM) and aggressive SM (ASM).</p>
<b>2A21.00</b>	Mast cell leukaemia
<b>2A21.0Y</b>	Other specified systemic mastocytosis
<b>2A21.0Z</b>	Systemic mastocytosis, unspecified
<b>2A21.1</b>	<p><b>Cutaneous mastocytosis</b></p> <p>Cutaneous mastocytosis is characterised by abnormal accumulation and proliferation of cutaneous mast cells. Most types are isolated but cutaneous mastocytosis can occur in association with systemic disease. Clinical forms include cutaneous mastocytoma, urticaria pigmentosa (the most frequent form), pseudoxanthomatous nodular cutaneous mastocytosis, telangiectasia macularis eruptiva perstans and diffuse cutaneous mastocytosis.</p>
<b>2A21.10</b>	Urticaria pigmentosa <i>Inclusions:</i> Maculopapular cutaneous mastocytosis
<b>2A21.1Y</b>	Other specified cutaneous mastocytosis
<b>2A21.1Z</b>	Cutaneous mastocytosis, unspecified

<b>2A21.2</b>	<b>Mast cell sarcoma</b> A rare entity characterised by localised but destructive growth of a tumour consisting of highly atypical, immature mast cells.
<b>2A21.3</b>	<b>Extracutaneous mastocytoma</b> A localised tumour consisting of mature mast cells.
<b>2A21.Y</b>	<b>Other specified mastocytosis</b>
<b>2A21.Z</b>	<b>Mastocytosis, unspecified</b>
<b>2A22</b>	<b>Other and unspecified myeloproliferative neoplasms</b>
	<b><i>Exclusions:</i></b> Chronic myelogenous leukaemia, BCR-ABL1-positive (2A20.0) Atypical chronic myeloid leukaemia, BCR-ABL1-negative (2A41)

#### Myelodysplastic syndromes (2A30-2A3Z)

Clonal hematopoietic disorders characterised by dysplasia and ineffective hematopoiesis in one or more of the hematopoietic cell lines. The dysplasia may be accompanied by an increase in myeloblasts, but the number is less than 20% in marrow and blood, which, according to the WHO guidelines, is the requisite threshold for the diagnosis of acute myeloid leukaemia.

***Exclusions:***      Therapy-related myeloid neoplasms (2A60.2)  
                          Drug-induced aplastic anaemia (3A70.10)

#### **2A30**                **Refractory anaemia**

#### **2A31**                **Refractory neutropaenia**

A myelodysplastic syndrome characterised by the presence of at least 10% dysplastic neutrophils in the bone marrow or the peripheral blood.

#### **2A32**                **Refractory thrombocytopenia**

A myelodysplastic syndrome characterised by the presence of at least 10% dysplastic megakaryocytes, found within at least 30 megakaryocytes examined in the bone marrow.

#### **2A33**                **Refractory anaemia with ring sideroblasts**

A myelodysplastic syndrome characterised by an anaemia in which 15% or more of the erythroid precursors are ringed sideroblasts. The ring sideroblast is an erythroid precursor in which one third or more of the nucleus is encircled by granules which are positive for iron stain.

#### **2A34**                **Refractory cytopenia with multi-lineage dysplasia**

A myelodysplastic syndrome characterised by bi-cytopenia or pancytopenia and dysplastic changes in 10% or more of the cells in two or more of the myeloid cell lines.

**2A35****Refractory anaemia with excess of blasts**

A myelodysplastic syndrome characterised by bi-cytopenia or pancytopenia and dysplastic changes in one or multiple lineages, with 5-19% myeloblasts in the bone marrow, 2-19% blasts in the blood, or <20% blasts with the presence of Auer rods.

**2A36****Myelodysplastic syndrome with isolated del(5q)**

A myelodysplastic syndrome characterised by anaemia with or without other cytopenias and/or thrombocytosis and in which the sole cytogenetic abnormality is del(5q). Myeloblasts are <5% in the bone marrow and <1% in the blood.

**Inclusions:** 5 q- syndrome

**2A37****Myelodysplastic syndrome, unclassifiable**

A subtype of myelodysplastic syndrome which at disease presentation lacks findings appropriate for classification into any other MDS category, or has an MDS-associated cytogenetic abnormality and cytopenia, but lack sufficient dysplastic changes in any lineage and have <15% ring sideroblasts.

**2A38****Refractory cytopenia of childhood**

The most common subtype of the myelodysplastic syndromes affecting children. It is characterised by persistent cytopenia with less than 5% blasts in the bone marrow and less than 2% blasts in the peripheral blood.

**2A3Y****Other specified myelodysplastic syndromes****2A3Z****Myelodysplastic syndromes, unspecified****Myelodysplastic and myeloproliferative neoplasms (2A40-2A4Z)**

A category of clonal haematopoietic disorders that have both myelodysplastic and myeloproliferative features at the time of initial presentation.

**2A40****Chronic myelomonocytic leukaemia**

A myelodysplastic/myeloproliferative neoplasm which is characterised by persistent monocytosis, absence of a Philadelphia chromosome and BCR/ABL1 fusion gene, fewer than 20 percent blasts in the bone marrow and blood, often myelodysplasia, and absence of PDGFRA or PDGFRB rearrangement.

**Inclusions:** Chronic monocytic leukaemia

**Exclusions:** Myeloid/lymphoid neoplasm associated with PDGFRA rearrangement (2A50)

Myeloid neoplasm associated with PDGFRB rearrangement (2A51)

**2A41****Atypical chronic myeloid leukaemia, BCR-ABL1-negative**

A myelodysplastic/myeloproliferative neoplasm characterised by the principal involvement of the neutrophil series with leukocytosis with circulating immature myeloid cells, fewer than 20 percent blasts in the bone marrow and blood, and severe dysgranulopoiesis. The neoplastic cells do not have a Philadelphia chromosome or the BCR/ABL1 fusion gene.

**2A42**

**Juvenile myelomonocytic leukaemia**

A myelodysplastic/myeloproliferative neoplasm of childhood that is characterised by proliferation principally of the granulocytic and monocytic lineages. Myelomonocytic proliferation is seen in the bone marrow and the blood. The leukemic cells may infiltrate any tissue, however liver, spleen, lymph nodes, skin, and respiratory tract are the most common sites of involvement.

**2A42.0**

**Juvenile myelomonocytic leukaemia in complete remission**

**2A42.Y**

**Other specified juvenile myelomonocytic leukaemia**

**2A42.Z**

**Juvenile myelomonocytic leukaemia, unspecified**

**2A43**

**Refractory anaemia with ring sideroblasts associated with marked thrombocytosis**

A provisional entity that encompasses cases with morphologic and clinical characteristics of refractory anaemia with ring sideroblasts, marked thrombocytosis, and abnormal megakaryocytes.

**2A44**

**Myeloproliferative and myelodysplastic disease, unclassifiable**

This entity includes cases that have clinical, laboratory, and morphologic features that support the diagnosis of both a myelodysplastic syndrome and a myeloproliferative neoplasm, but do not meet the criteria for any of the other entities included in the myelodysplastic/myeloproliferative neoplasm category.

**2A4Y**

**Other specified myelodysplastic and myeloproliferative neoplasms**

**2A4Z**

**Myelodysplastic and myeloproliferative neoplasms, unspecified**

Myeloid and lymphoid neoplasms with eosinophilia and abnormalities of PDGFRA, PDGFRB or FGFR1 (2A50-2A5Z)

A group of rare myeloid and lymphoid neoplasms characterised by rearrangement of the PDGFRA, PDGFRB, or FGFR1 genes, resulting in the formation of fusion transcripts and aberrant tyrosine kinase activity. Eosinophilia is a characteristic finding but it is not always present.

**2A50**

**Myeloid/lymphoid neoplasm associated with PDGFRA rearrangement**

**2A51**

**Myeloid neoplasm associated with PDGFRB rearrangement**

A distinct type of myeloid neoplasm that occurs in association with rearrangement of PDGFRB gene at 5q32. Patients usually present with a picture resembling chronic myelomonocytic leukaemia and, less often atypical chronic myeloid leukaemia or chronic eosinophilic leukaemia.

**2A52**

**Myeloid or lymphoid neoplasms with FGFR1 abnormalities**

Hematologic neoplasms characterised by the rearrangement of the FGFR1 gene, resulting in translocations with an 8p11 breakpoint. Patients may present with a myeloproliferative neoplasm, acute myeloid leukaemia, lymphoblastic lymphoma/leukaemia of T or B-cell lineage, or acute leukaemia of mixed phenotype.

**2A5Z**

**Myeloid and lymphoid neoplasms with eosinophilia and abnormalities of PDGFRA, PDGFRB or FGFR1, unspecified**

**2A60**

**Acute myeloid leukaemias and related precursor neoplasms**

Acute myeloid leukaemia is characterised by clonal expansion of myeloid blasts in the peripheral blood and bone marrow. Clinical manifestations are fever, pallor, anaemia, hemorrhages and recurrent infections.

**2A60.0**

**Acute myeloid leukaemia with recurrent genetic abnormalities**

**2A60.1**

**Acute myeloid leukaemia with myelodysplasia-related changes**

An acute myeloid leukaemia with at least 20% blasts in the bone marrow or blood, and either a previous history of myelodysplastic syndrome, multilineage dysplasia or typical myelodysplastic syndrome-related cytogenetic abnormalities. There is no history of prior cytotoxic therapy for an unrelated disorder, and there is absence of the genetic abnormalities that are present in acute myeloid leukaemia with recurrent genetic abnormalities.

**2A60.2**

**Therapy-related myeloid neoplasms**

**Inclusions:** therapy-related myelodysplastic syndromes

**2A60.20**

Therapy related acute myeloid leukaemia or myelodysplastic syndrome

**2A60.2Y**

Other specified therapy-related myeloid neoplasms

**2A60.2Z**

Therapy-related myeloid neoplasms, unspecified

**2A60.3**

**Acute myeloid leukaemia, not elsewhere classified by criteria of other types**

Acute myeloid leukaemias specified by morphological criteria should only be classified as such, if recurrent genetic abnormalities, prior history of a myelodysplastic syndrome or myelodysplastic/myeloproliferative neoplasm, or history of cytotoxic chemotherapy and/or radiotherapy are absent.

**Exclusions:** Acute myeloid leukaemia with recurrent genetic abnormalities (2A60.0)

Therapy-related myeloid neoplasms (2A60.2)

Acute myeloid leukaemia with myelodysplasia-related changes (2A60.1)

**2A60.30**

Acute myeloid leukaemia with minimal differentiation

An acute myeloid leukaemia (AML) in which the blasts do not show evidence of myeloid differentiation by morphology and conventional cytochemistry.

**2A60.31**

Acute myeloid leukaemia without maturation

An acute myeloid leukaemia (AML) characterised by blasts without evidence of maturation to more mature neutrophils.

**2A60.32**

Acute myeloid leukaemia with maturation

An acute myeloid leukaemia (AML) characterised by blasts with evidence of maturation to more mature neutrophils.

- 2A60.33** Acute myelomonocytic leukaemia  
An acute leukaemia characterised by the proliferation of both neutrophil and monocyte precursors.
- 2A60.34** Acute monoblastic or monocytic leukaemia  
Acute monoblastic leukaemia and acute monocytic leukaemia are myeloid leukaemias in which 80% or more of the leukaemic cells are of monocytic lineage including monoblasts, promonocytes and monocytes; a minor neutrophil component, <20%, may be present.
- 2A60.35** Acute erythroid leukaemia  
**Inclusions:** Erythroleukaemia
- 2A60.36** Acute megakaryoblastic leukaemia  
An acute myeloid leukaemia in which at least 50% of the blasts are of megakaryocytic lineage.  
**Inclusions:** Acute myeloid leukaemia, M7  
Acute megakaryocytic leukaemia
- 2A60.37** Acute basophilic leukaemia  
An acute myeloid leukaemia in which the immature cells differentiate towards basophils. This is a rare leukaemia.
- 2A60.38** Acute panmyelosis with myelofibrosis  
An acute myeloid leukaemia characterised by bone marrow fibrosis without preexisting primary myelofibrosis.  
**Inclusions:** Acute myelofibrosis  
**Exclusions:** Cases that meet criteria for AML with myelodysplasia related changes (2A60.1)
- 2A60.39** Myeloid sarcoma  
Myeloid sarcoma is a rare solid tumour of the myelogenous cells occurring in an extramedullary site.  
**Inclusions:** Chloroma  
Granulocytic sarcoma
- 2A60.3Y** Other specified acute myeloid leukaemia, not elsewhere classified by criteria of other types
- 2A60.3Z** Acute myeloid leukaemia, unspecified
- 2A60.4** **Myeloid proliferation associated with Down syndrome**  
Myeloid neoplasms occurring in individuals with Down syndrome. There is an increased risk of acute leukaemias in both children and adults with Down syndrome. In particular, the incidence of acute myeloid leukaemia in Down syndrome children of less than five years of age is particularly high, it is usually an acute megakaryoblastic leukaemia, and is associated with GATA1 gene mutation. This group of disorders also includes the entity transient abnormal myelopoiesis which occurs in neonates and is associated with GATA1 gene mutation.

- 2A60.40** Transient abnormal myelopoiesis  
 A myeloid proliferation occurring in newborns with Down syndrome. It is clinically and morphologically indistinguishable from acute myeloid leukaemia and is associated with GATA1 mutations. The blasts display morphologic and immunophenotypic features of megakaryocytic lineage. In the majority of patients the myeloid proliferation undergoes spontaneous remission.
- 2A60.41** Myeloid leukaemia associated with Down syndrome  
 Leukaemia of children with Down syndrome. Encompasses both MDS and AML
- 2A60.4Y** Other specified myeloid proliferation associated with Down syndrome
- 2A60.4Z** Myeloid proliferation associated with Down syndrome, unspecified
- 2A60.5** **Blastic plasmacytoid dendritic cell neoplasm**  
 Blastic plasmacytoid dendritic cell neoplasm (BPDCN) is a clinically aggressive tumour derived from the precursors of plasmacytoid dendritic cells (PDCs, also called professional type I interferon-producing cells or plasmacytoid monocytes), with a high frequency of cutaneous and bone marrow involvement and leukaemic dissemination.  
 There are currently no clues to the etiology of BPDCN, but its association with myelodysplastic syndrome (MDS) in some cases may suggest a related pathogenesis. Gene expression profiling studies have revealed that the neoplastic cells show a gene expression signature similar to that of resting normal PDCs and closer to that of myeloid than of lymphoid precursors.  
*Inclusions:* blastic NK-cell lymphoma
- 2A60.Y** **Other specified acute myeloid leukaemias and related precursor neoplasms**
- 2A60.Z** **Acute myeloid leukaemias and related precursor neoplasms, unspecified**
- 2A61** **Acute leukaemias of ambiguous lineage**  
 An acute leukaemia in which the blasts lack sufficient evidence to classify as myeloid or lymphoid or they have morphologic and/or immunophenotypic characteristics of both myeloid and lymphoid cells.

#### Precursor lymphoid neoplasms (2A70-2A7Z)

Neoplasms of immature malignant lymphocytes (lymphoblasts) committed to the B-cell or T-cell lineage. Neoplasms involving the bone marrow and the peripheral blood are called precursor lymphoblastic leukaemias or acute lymphoblastic leukaemias. Neoplasms involving primarily lymph nodes or extranodal sites are called lymphoblastic lymphomas.

- 2A70** **Precursor B-lymphoblastic neoplasms**  
 Neoplasms of lymphoblasts committed to the B-cell lineage.
- 2A70.0** **B lymphoblastic leukaemia or lymphoma, not elsewhere classified**  
 Precursor B cell neoplasm without defined recurrent genetic abnormality despite appropriate diagnostics

**2A70.1** **B lymphoblastic leukaemia or lymphoma with t(9;22) (q34;q11.2); BCR-ABL1**  
A precursor lymphoid neoplasm which is composed of B-lymphoblasts and carries a translocation between the BCR gene on chromosome 22 and the ABL1 gene on chromosome 9. It results in the production of the p190 kd or p210 kd fusion protein. It has an unfavorable clinical outcome.

**2A70.Y** **Other B-lymphoblastic leukaemia/lymphoma with recurrent genetic abnormalities**

**2A71** **Precursor T-lymphoblastic neoplasms**

A neoplasm of lymphoblasts committed to the T-cell lineage, typically composed of small to medium-sized blast cells.

**2A7Z** **Precursor lymphoid neoplasms, unspecified**

Mature B-cell neoplasms (2A80-2A8Z)

Non-Hodgkin lymphomas that originate from mature B lymphocytes. May reside in lymph nodes, lymphatic tissue of different organs or bone marrow and blood (then frequently called leukaemia).

**2A80** **Follicular lymphoma**

Follicular lymphoma (FL) is a neoplasm composed of follicle centre (germinal centre) B-cells (typically both centrocytes and centroblasts/large transformed cells), which usually has at least a partially follicular pattern. t(14;18) with BCL2 rearrangement is frequently observed. If diffuse areas of any size comprised predominantly or entirely of blastic cells are present in any case of follicular lymphoma, a diagnosis of diffuse large B-cell lymphoma is also made. Lymphomas composed of centrocytes and centroblasts with an entirely diffuse pattern in the sampled tissue may be included in this category.

**Inclusions:** follicular lymphoma with or without diffuse areas

**Exclusions:** Mature T-cell or NK-cell neoplasms (2A90-2B2Z)

**2A80.0** **Follicular lymphoma grade 1**

**2A80.1** **Follicular lymphoma grade 2**

**2A80.2** **Follicular lymphoma grade 3**

**2A80.3** **Primary cutaneous follicle centre lymphoma**

A primary lymphoma of the skin composed of various numbers of small and large irregular neoplastic follicle center cells. Its morphologic pattern can be nodular, diffuse, or nodular and diffuse. It presents with solitary or grouped plaques and tumours, and it usually involves the scalp, forehead, or trunk. It rarely involves the legs. This type of cutaneous lymphoma tends to remain localised to the skin, and it has a favorable prognosis.

- 2A80.4 Paediatric type follicular lymphoma**  
A variant of follicular lymphoma often involving cervical or other peripheral lymph nodes and the Waldeyer ring. It is frequently localised, and often lacks BCL-2 protein expression and never has a BCL2 translocation. It is usually but not exclusively seen in the pediatric population. The prognosis is usually favorable.
- 2A80.5 Follicular lymphoma in situ**
- 2A80.6 Follicular lymphoma of small intestine**
- 2A80.Y Other specified follicular lymphoma**
- 2A80.Z Follicular lymphoma, unspecified**
- 2A81 Diffuse large B-cell lymphomas**  
Non-Hodgkin lymphomas are characterised by a proliferation of predominantly large neoplastic B lymphocytes.  
**Coded Elsewhere:** Diffuse large B-cell lymphoma of small intestine (2B33.5)
- 2A81.0 Primary mediastinal large B-cell lymphoma**  
A large B-cell non-Hodgkin lymphoma arising in the mediastinum. Morphologically it is characterised by a massive diffuse lymphocytic proliferation associated with compartmentalizing fibrosis.
- 2A81.1 Intravascular large B-cell lymphoma**
- 2A81.2 Plasmablastic lymphoma**  
An aggressive diffuse large B-cell lymphoma frequently arising in the setting of HIV infection and characterised by the presence of large neoplastic cells resembling B-immunoblasts which have the immunophenotypic profile of plasma cells. Sites of involvement include the oral cavity and other extranodal sites
- 2A81.3 Lymphomatoid granulomatosis**
- 2A81.4 T-cell/histiocyte rich large B-cell lymphoma**  
A large B-cell lymphoma characterised by the presence of a limited number of scattered neoplastic large B-lymphocytes which are admixed with numerous non-neoplastic T-lymphocytes and frequently histiocytes.
- 2A81.5 Primary diffuse large B-cell lymphoma of central nervous system**
- 2A81.6 Epstein-Barr Virus-positive diffuse large B-cell lymphoma of the elderly**  
An aggressive diffuse large B-cell lymphoma affecting patients older than 50 years. Epstein-Barr virus is present in all cases. There is no known history of immunodeficiency or prior lymphoma. The majority of patients present with extranodal disease.
- 2A81.7 Diffuse large B-cell lymphoma associated with chronic inflammation**  
A diffuse large B-cell lymphoma arising in body cavities or narrow spaces of long standing chronic inflammation. The classic example is the pyothorax-associated lymphoma that arises in the pleural cavity of patients with a history of long standing pyothorax.

- 2A81.8 ALK-positive large B-cell lymphoma**  
A usually aggressive large B-cell lymphoma characterised by the presence of monomorphic immunoblast-like neoplastic B-lymphocytes in a sinusoidal growth pattern. The neoplastic B-lymphocytes express the ALK kinase but they lack the 2;5 translocation.
- 2A81.9 Primary effusion lymphoma**  
An aggressive non-Hodgkin B-cell lymphoma composed of large cells, presenting as a serous effusion without detectable tumour masses. It is universally associated with human herpes virus 8 (HHV-8)/Kaposi sarcoma herpes virus (KSHV) [HHV-8/KSHV]. It mostly occurs in the setting of immunodeficiency; most cases have been reported in HIV positive patients. The most common sites of involvement are the pleural, pericardial, and peritoneal cavities. The prognosis is extremely unfavorable.
- 2A81.A Primary cutaneous diffuse large B-cell lymphoma, leg type**  
An aggressive primary cutaneous B-cell lymphoma, usually involving the lower leg. It is composed of a generally monotonous proliferation of immunoblasts, or less frequently centroblasts, with few admixed reactive cells. This type of lymphoma occurs most often in the elderly who present with rapidly growing tumours, usually on one or both legs. Dissemination to extracutaneous sites is frequent.
- 2A81.Y Other specified diffuse large B-cell lymphomas**
- 2A81.Z Diffuse large B-cell lymphoma, not otherwise specified**
- 2A82 Mature B-cell neoplasm with leukaemic behaviour**
- 2A82.0 Chronic lymphocytic leukaemia or small lymphocytic lymphoma**  
An indolent, mature B-cell neoplasm composed of small, round B-lymphocytes. When the bone marrow and peripheral blood are involved, the term chronic lymphocytic leukaemia is used. The term small lymphocytic lymphoma is restricted to cases which do not show leukemic involvement of the bone marrow and peripheral blood.
- Inclusions:** Small cell B-cell lymphoma

<b>2A82.00</b>	Chronic lymphocytic leukaemia of B-cell type Chronic lymphocytic leukaemia/small lymphocytic lymphoma (CLL/SLL) is a neoplasm composed of monomorphic small, round to slightly irregular B lymphocytes in the peripheral blood (PB), bone marrow (BM), spleen and lymph nodes, admixed with prolymphocytes and paraimmunoblasts forming proliferation centres in tissue infiltrates. The CLL/SLL cells usually coexpress CD5 and CD23. In the absence of extramedullary tissue involvement, there must be $<5 \times 10^9/L$ monoclonal lymphocytes with a CLL phenotype in the PB. The International Workshop on Chronic Lymphocytic Leukemia (IWCLL) report requires that the lymphocytosis be present for at least 3 months and also allows for the diagnosis of CLL to be made with lower lymphocyte counts in patients with cytopenias or disease-related symptoms. Whether patients who would have fulfilled the criteria in the past for CLL but who fulfill the criteria only for monoclonal B lymphocytosis (MBL) are better considered to have low stage CLL or MBL remains to be determined. Some may prefer to still consider many of these cases more like CLL. The term SLL is used for non-leukaemic cases with the tissue morphology and immunophenotype of CLL. The IWCLL definition of SLL requires lymphadenopathy, no cytopenias due to BM infiltration by CLL/SLL and $<5 \times 10^9/L$ PB B-cells.
	<b>Inclusions:</b> Lymphoplasmacytic leukaemia
	<b>Exclusions:</b> Lymphoplasmacytic lymphoma (2A85.4)
	<b>Coded Elsewhere:</b> Richter syndrome (2A81.Y)
<b>2A82.0Y</b>	Other specified chronic lymphocytic leukaemia or small lymphocytic lymphoma
<b>2A82.0Z</b>	Chronic lymphocytic leukaemia or small lymphocytic lymphoma, unspecified
<b>2A82.1</b>	<b>B-cell prolymphocytic leukaemia</b>
<b>2A82.10</b>	B-cell prolymphocytic leukaemia in complete remission
<b>2A82.1Y</b>	Other specified b-cell prolymphocytic leukaemia
<b>2A82.1Z</b>	B-cell prolymphocytic leukaemia, unspecified
<b>2A82.2</b>	<b>Hairy-cell leukaemia</b>
	A neoplasm of small B-lymphocytes with hairy projections in bone marrow, spleen, and peripheral blood. Most patients present with splenomegaly and pancytopenia.
	<b>Inclusions:</b> Leukaemic reticuloendotheliosis
<b>2A82.3</b>	<b>Splenic B-cell lymphoma or leukaemia, unclassifiable</b>
	A small B-cell clonal lymphoproliferative disorder of the spleen that does not fall into any of the other categories of mature B-cell neoplasms.
<b>2A82.Y</b>	<b>Other specified mature B-cell neoplasm with leukaemic behaviour</b>
<b>2A82.Z</b>	<b>Mature B-cell neoplasm with leukaemic behaviour, unspecified</b>
<b>2A83</b>	<b>Plasma cell neoplasms</b>
	Plasma cells, usually secreting monoclonal immunoglobulin (M-protein) and/or immunoglobulin light chains.
<b>2A83.0</b>	<b>Monoclonal gammopathy of undetermined significance</b>

- 2A83.1      Plasma cell myeloma**  
A bone marrow-based plasma cell neoplasm usually characterised by presence of a serum monoclonal protein and/or urinary light chains. "CRAB" criteria (calcium elevation (hypercalcaemia), renal failure, anaemia and bone lesions) separate symptomatic plasma cell myeloma from asymptomatic (smoldering) myeloma.
- Inclusions:**      Kahler disease  
                        Myelomatosis  
                        Medullary plasmacytoma  
                        multiple myeloma
- Exclusions:**      Solitary plasmacytoma (2A83.2)
- 2A83.2      Solitary plasmacytoma**  
A single focus of clonal (malignant) plasma cells either in the bone or in another anatomic site without peripheral blood involvement.
- Inclusions:**      Solitary myeloma
- 2A83.3      Extraosseous plasmacytoma**
- 2A83.4      Plasma cell leukaemia**  
An aggressive plasma cell neoplasm. It is characterised by the presence of neoplastic plasma cells in the peripheral blood (PB). The neoplastic plasma cells comprise more than 20% of the white cells in the PB or the number of clonal plasma cells in the PB exceeds  $2 \times 10^9/L$ .
- 2A83.5      Monoclonal immunoglobulin deposition disease**
- 2A83.50      Heavy chain deposition disease**  
A disease of the kidney, caused by proliferation and deposition of pieces of truncated or abnormal alpha, gamma, delta, or mu immunoglobulin heavy chain segments of white blood cells. This disease is characterised by fibrillar or granular tissue deposits and renal dysfunction, which may lead to organ failure. Confirmation is by identifying heavy chain deposition tissue biopsy using immunofluorescence under a microscope.
- Exclusions:**      Heavy chain diseases or malignant immunoproliferative diseases (2A84)  
                        Immunoglobulin heavy chain deficiency (4A01.04)
- 2A83.51      Light and heavy chain deposition disease**  
A disease of the kidney, caused by proliferation and deposition of pieces of truncated or abnormal light and heavy chain segments of white blood cells. This disease is characterised by fibrillar or granular tissue deposits and renal dysfunction, which may lead to organ failure. Confirmation is by identification of light and heavy chain deposition tissue biopsy under a microscope.

- 2A83.52** Light chain deposition disease  
 A disease of the kidney, caused by the deposition of pieces of truncated or abnormal light chain segments of white blood cells. This disease is characterised by fibrillar or granular tissue deposits and renal dysfunction, which may lead to organ failure. Confirmation is by identification of light chain deposition tissue biopsy under an electron microscope.
- Exclusions:** Immunodeficiencies with isotype or light chain deficiencies with normal number of B cells (4A01.04)
- 2A83.Y** Other specified multiple myeloma and plasma cell neoplasms
- 2A83.Z** Plasma cell neoplasm, unspecified
- 2A84** Heavy chain diseases or malignant immunoproliferative diseases  
 A group of rare disorders of immunoglobulin synthesis associated with B-cell proliferative disorders that produce monoclonal heavy chains and typically no light chains.
- 2A84.0** Alpha heavy chain disease  
 The small intestinal morphologic changes are consistent with a mucosa-associated lymphoid tissue lymphoma (MALT lymphoma).
- 2A84.1** Gamma heavy chain disease  
 A clonal disorder characterised by the secretion of a truncated gamma chain. In most cases, it is associated with morphologic changes also seen in lymphoplasmacytic lymphomas, but the clinical course is typically more aggressive than in lymphoplasmacytic lymphoma/Waldenstrom's macroglobulinemia.
- Inclusions:** Franklin disease
- 2A84.2** Mu heavy chain disease
- 2A84.Y** Other specified malignant immunoproliferative diseases
- 2A84.Z** Heavy chain diseases, unspecified
- 2A85** Other specified mature B-cell neoplasms or lymphoma  
**2A85.0** Nodal marginal zone lymphoma  
 A primary nodal B-cell non-Hodgkin lymphoma which morphologically resembles lymph nodes involved by marginal zone lymphomas of extranodal or splenic types, but without evidence of extranodal or splenic disease. This is a rare entity, and most patients present with localised or generalised lymphadenopathy. The clinical course is indolent.
- 2A85.1** Extranodal marginal zone B-cell lymphoma of mucosa-associated lymphoid tissue of stomach  
 A low grade, indolent B-cell lymphoma, usually associated with Helicobacter pylori infection. Morphologically it is characterised by a dense mucosal atypical lymphocytic (centrocyte-like cell) infiltrate with often prominent lymphoepithelial lesions and plasmacytic differentiation. Some of gastric MALT lymphomas carry the t(11;18)(q21;q21). Such cases are resistant to Helicobacter pylori therapy.

<b>2A85.2</b>	<b>Extranodal marginal zone B-cell lymphoma, primary site skin</b> A low-grade, extranodal marginal zone B-cell lymphoma of the mucosa-associated lymphoid tissue that arises from the skin. It usually presents with multifocal papular or nodular lesions in the arms or trunk. It rarely disseminates to internal organs or progresses to high grade lymphoma.
<b>2A85.3</b>	<b>Extranodal marginal zone B-cell lymphoma, primary site excluding stomach or skin</b>
<b>2A85.4</b>	<b>Lymphoplasmacytic lymphoma</b> Neoplasm of small B lymphocytes and plasma cells, mostly residing in the bone marrow. Frequently associated with the production of an IgM serum monoclonal protein, then called Waldenström macroglobulinemia (WM).  <i>Inclusions:</i> primary macroglobulinaemia Waldenström macroglobulinaemia Waldenström macroglobulinaemia without mention of remission  <i>Exclusions:</i> small cell B-cell lymphoma (2A82.0) Chronic lymphocytic leukaemia or small lymphocytic lymphoma (2A82.0)
<b>2A85.5</b>	<b>Mantle cell lymphoma</b> Mantle cell lymphoma is a rare form of malignant non-Hodgkin lymphoma affecting B lymphocytes in the lymph nodes in a region called the ``mantle zone''. It accounts for 2-10% of lymphomas.  <i>Inclusions:</i> Small cell mantle cell lymphoma
<b>2A85.6</b>	<b>Burkitt lymphoma including Burkitt leukaemia</b> A highly aggressive lymphoma composed of monomorphic medium-sized B-cells with basophilic cytoplasm and numerous mitotic figures. It is often associated with the presence of Epstein-Barr virus (EBV) and is commonly seen in AIDS patients. Three morphologic variants are recognised: classical Burkitt lymphoma, Burkitt lymphoma with plasmacytoid differentiation, and atypical Burkitt/Burkitt-like lymphoma. All cases express the MYC translocation [t(8;14)].  <i>Inclusions:</i> "Burkitt-like" lymphoma <i>Coded Elsewhere:</i> HIV - [human immunodeficiency virus] disease associated with Burkitt lymphoma (1C62.3Y)
<b>2A85.Y</b>	<b>Further specified mature B-cell neoplasms or lymphoma</b>
<b>2A86</b>	<b>B-cell lymphoma, mixed features</b>
<b>2A86.0</b>	<b>Malignant lymphoma of B cell type, not elsewhere classified</b>
<b>Coding Note:</b>	If B-cell lineage or involvement is mentioned in conjunction with a specific lymphoma, code to the more specific description.
<b>2A86.1</b>	<b>B-cell lymphoma unclassifiable with features intermediate between Burkitt lymphoma and diffuse large B-cell lymphoma</b>

- 2A86.2**      **B-cell lymphoma unclassifiable with features intermediate between classical Hodgkin lymphoma and diffuse large B-cell lymphoma**
- 2A86.Y**      **Other specified B-cell lymphoma, mixed features**
- 2A86.Z**      **B-cell lymphoma, mixed features, unspecified**
- 2A8Z**      **Mature B-cell neoplasms, unspecified**

Mature T-cell or NK-cell neoplasms (2A90-2B2Z)

A group of neoplasms composed of T-lymphocytes with a mature (peripheral/post-thymic) immunophenotypic profile and/or NK-cells.

- 2A90**      **Mature T-cell lymphoma, specified types, nodal or systemic**
- 2A90.0**      **T-cell prolymphocytic leukaemia**  
An aggressive T-cell leukaemia, characterised by the proliferation of small to medium sized prolymphocytes with a mature T-cell phenotype, involving the blood, bone marrow, lymph nodes, liver, spleen, and skin.
- 2A90.1**      **T-cell large granular lymphocytic leukaemia**  
A T-cell peripheral neoplasm characterised by a persistent (>6 months) increase in the number of peripheral blood large granular lymphocytes, without a clearly identified cause.
- 2A90.2**      **Chronic lymphoproliferative disorders of NK-cells**  
Heterogeneous disorders with a chronic clinical course affecting predominantly adults and characterised by the proliferation of large granular lymphocytes with natural killer cell immunophenotype.
- 2A90.3**      **Aggressive NK cell leukaemia**  
A rare, highly aggressive, Epstein-Barr virus-associated leukaemia, also known as aggressive NK-cell leukaemia/lymphoma; it may represent the leukemic counterpart of nasal type extranodal NK/T-cell lymphomas. It affects primarily teenagers and young adults. It is characterised by the systemic proliferation of NK cells in the peripheral blood, bone marrow, liver, and spleen.
- 2A90.4**      **Systemic Epstein-Barr Virus-positive T-cell lymphoma of childhood**  
This neoplasm of childhood is characterised by a clonal proliferation of EBV-infected T-cells with an activated cytotoxic phenotype. It can occur shortly after primary acute EBV infection or in the setting of chronic active EBV infection (CAEBV).
- 2A90.5**      **Adult T-cell lymphoma or leukaemia, human T-cell lymphotropic virus type 1-associated**  
A peripheral (mature) T-cell neoplasm linked to the human T-cell leukaemia virus type 1 (HTLV-1). Adult T-cell leukaemia/lymphoma is endemic in several regions of the world, in particular Japan, the Caribbean, and parts of Central Africa.
- Coded Elsewhere:** Adult T-cell leukaemia or lymphoma, skin (2B0Y)

- 2A90.6 Extranodal NK/T-cell lymphoma, nasal type**  
An aggressive, predominantly extranodal, mature T-cell non-Hodgkin lymphoma. It is characterised by an often angiocentric and angiodesctructive cellular infiltrate composed of EBV positive NK/T cells. The nasal cavity is the most common site of involvement. Patients often present with midfacial destructive lesions (lethal midline granuloma). The disease may disseminate rapidly to various anatomic sites including the gastrointestinal tract, skin, testis, and cervical lymph nodes. It is also known as angiocentric T-cell lymphoma. The term polymorphic reticulosis has been widely used to describe the morphologic changes seen in this type of lymphoma. However, the latter term may also apply to lymphomatoid granulomatosis, which is an angiocentric and angiodesctructive EBV positive B-cell lymphoproliferative disorder.
- 2A90.7 Enteropathy associated T-cell lymphoma**  
An uncommon mature T-cell lymphoma of intraepithelial lymphocytes. It usually arises from the small intestine, most commonly the jejunum or ileum. Other less frequent primary anatomic sites include the duodenum, stomach, colon, or outside the gastrointestinal tract. Type II of this lymphoma may occur sporadically outside the context of celiac disease.
- Inclusions:*      Enteropathy type intestinal T-cell lymphoma  
                          Intestinal T-cell lymphoma
- 2A90.8 Hepatosplenic T-cell lymphoma**  
An extranodal, mature T-cell non-Hodgkin lymphoma that originates from cytotoxic T-cells, usually of gamma/delta T-cell type. It is characterised by the presence of medium-size neoplastic lymphocytes infiltrating the hepatic sinusoids. A similar infiltrating pattern is also present in the spleen and bone marrow that are usually involved at the time of the diagnosis.
- 2A90.9 Angioimmunoblastic T-cell lymphoma**  
A mature T-cell non-Hodgkin lymphoma, characterised by systemic disease and a polymorphous infiltrate involving lymph nodes and extranodal sites. The clinical course is typically aggressive.
- Inclusions:*      AILD - [angioimmunoblastic lymphadenopathy with dysproteinaemia]
- 2A90.A Anaplastic large cell lymphoma, ALK-positive**  
A T-cell peripheral lymphoma composed of usually large, pleomorphic, CD30 positive T-lymphocytes with abundant cytoplasm characterised by the presence of a translocation involving the ALK gene and expression of ALK fusion protein. Most patients present with peripheral and/or abdominal lymphadenopathy, and often have advanced disease and extranodal involvement.
- Inclusions:*      Anaplastic large cell lymphoma, CD30-positive

**2A90.B Anaplastic large cell lymphoma, ALK-negative**  
A T-cell peripheral lymphoma morphologically indistinguishable from anaplastic large cell lymphoma, ALK-positive. It is characterised by the absence of the translocation involving the ALK gene and lacks expression of ALK fusion protein.

**Exclusions:** Primary cutaneous CD30-positive T-cell lymphoproliferative disorders (2B03)

**2A90.C Peripheral T-cell lymphoma, not otherwise specified**  
A heterogeneous category of nodal and extranodal mature T-cell lymphomas, which do not correspond to any of the specifically defined entities of mature T-cell lymphoma in the current classification.

**Inclusions:** T-zone variant Peripheral T-cell lymphoma  
Lymphoepithelioid lymphoma  
Follicular variant Peripheral T-cell lymphoma

Mature T-cell or NK-cell lymphomas and lymphoproliferative disorders, primary cutaneous specified types (2B00-2B0Z)

Primary cutaneous T-cell lymphomas (CTCL) and NK-cell lymphomas are malignant lymphoproliferative diseases of unknown cause that are thought to originate from T-lymphocytes in the lymphoid tissue of the skin and by definition are confined to the skin at initial diagnosis. Included in the class is also a small number of lymphoma-like primary cutaneous lymphoproliferative disorders which are not considered to be truly malignant.

**Inclusions:** Primary cutaneous peripheral T-cell lymphoma

**Exclusions:** Skin infiltration by nodal or non-cutaneous extranodal lymphoma (2E08)

**2B00**

#### **Subcutaneous panniculitis-like T-cell lymphoma**

Subcutaneous panniculitis-like T-cell lymphoma is a neoplasm of alpha/beta, usually CD8+ T-cells, mainly confined to the subcutis, presenting clinically as subcutaneous nodules which are usually not ulcerated.

**2B01**

#### **Mycosis fungoides**

A peripheral (mature) T-cell lymphoma presenting in the skin with patches/plaques or less commonly with tumours or erythroderma. It is characterised by epidermal and dermal infiltration of small to medium-sized T-cells with cerebriform nuclei.

**2B02**

#### **Sézary syndrome**

A generalised peripheral (mature) T-cell neoplasm characterised by the presence of erythroderma, lymphadenopathy, and neoplastic, cerebriform T-lymphocytes in the blood. Sézary syndrome is an aggressive disease.

**2B03**

#### **Primary cutaneous CD30-positive T-cell lymphoproliferative disorders**

Primary skin disorders characterised immunohistologically by infiltration by neoplastic CD30+ lymphocytes.

- 2B03.0 Primary cutaneous CD30-positive anaplastic large cell lymphoma**  
An anaplastic large cell lymphoma that is limited to the skin at the time of diagnosis. Most patients present with solitary or localised skin lesions in a form of nodules or papules, which may be tumours. The t(2;5) translocation that is present in many cases of systemic anaplastic large cell lymphoma is not found in this disease.
- 2B03.1 Lymphomatoid papulosis**  
Lymphomatoid papulosis is a proliferation of T-cells, often clonal, characterised clinically by the appearance of crops of dome-shaped papules and nodules which tend to ulcerate and then heal with scarring.
- 2B0Y Other specified primary cutaneous mature T-cell or NK-cell lymphomas and lymphoproliferative disorders**
- 2B0Z Primary cutaneous T-cell lymphoma of undetermined or unspecified type**
- 2B2Y Other specified mature T-cell or NK-cell neoplasms**
- 2B2Z Mature T-cell or NK-cell neoplasms, unspecified**
- 2B30 Hodgkin lymphoma**  
Malignant lymphomas, previously known as Hodgkin's disease, characterised by the presence of large tumour cells in an abundant admixture of nonneoplastic cells. There are two distinct subtypes: nodular lymphocyte predominant Hodgkin lymphoma and classical Hodgkin lymphoma. Hodgkin lymphoma involves primarily lymph nodes.
- 2B30.0 Nodular lymphocyte predominant Hodgkin lymphoma**  
Nodular lymphocyte predominant Hodgkin lymphoma (NLPHL) is characterised by a nodular, or a nodular and diffuse proliferation of scattered large neoplastic cells known as popcorn or lymphocyte predominant cells (LP cells)—formerly called L&H cells for lymphocytic and/or histiocytic Reed-Sternberg cell variants. At present an overlap between NLPHL and T-cell-rich large B-cell lymphoma cannot be excluded.
- 2B30.1 Classical Hodgkin lymphoma**  
Classical Hodgkin lymphoma is a B-cell lymphoma characterised histologically by the presence of large mononuclear Hodgkin cells and multinucleated Reed-Sternberg (HRS) cells.  
  
A monoclonal B-cell lymphoproliferation in the vast majority of cases. It is characterised by a bimodal age distribution (15-30 years of life and late life) and is often associated with EBV infection. In less than 5% of cases it is a monoclonal proliferation of T-lymphocytes. Morphologically, it is characterised by the presence of Reed-Sternberg cells and mononuclear Hodgkin cells. The Reed-Sternberg and mononuclear Hodgkin cells are CD30 positive in nearly all cases and CD15 positive in the majority of cases.
- Inclusions:**      Classical Hodgkin lymphoma, type not specified

- 2B30.10** Nodular sclerosis classical Hodgkin lymphoma  
A subtype of classical Hodgkin lymphoma characterised by collagen bands surrounding lymphoid nodules. The lymphoid nodules contain lacunar and Reed-Sternberg cells. Mediastinal involvement occurs in 80% of patients. The prognosis of nodular sclerosis Hodgkin lymphoma is slightly better than that of mixed cellularity or lymphocyte depleted subtype.
- 2B30.11** Lymphocyte-rich classical Hodgkin lymphoma
- 2B30.12** Mixed cellularity classical Hodgkin lymphoma  
A subtype of classical Hodgkin lymphoma with a mixed inflammatory stroma containing Hodgkin and Reed-Sternberg cells.
- 2B30.13** Lymphocyte depleted classical Hodgkin lymphoma
- 2B30.1Z** Classical Hodgkin lymphoma, unspecified
- 2B30.Z** **Hodgkin lymphoma, unspecified**
- 2B31** **Histiocytic or dendritic cell neoplasms**  
True histiocytic malignancies are vanishing diagnoses due to improved understanding of the provenance of malignant cells.
- 2B31.0** **Juvenile xanthogranuloma**  
It is characterised by the presence of lipid-laden, foamy histiocytes and Touton-type giant cells in the dermis.
- 2B31.1** **Histiocytic sarcoma**  
*Inclusions:* Malignant Histiocytosis
- 2B31.2** **Langerhans cell histiocytosis**  
A neoplastic proliferation of Langerhans cells which contain Birbeck granules by ultrastructural examination. Three major overlapping syndromes are recognised: eosinophilic granuloma, Letterer-Siwe disease, and Hand-Schuller-Christian disease. The clinical course is generally related to the number of organs affected at presentation.  
*Inclusions:* Histiocytosis X
- 2B31.20** Langerhans cell histiocytosis involving the skin
- 2B31.2Y** Other specified Langerhans cell histiocytosis
- 2B31.2Z** Langerhans cell histiocytosis, unspecified
- 2B31.3** **Langerhans cell sarcoma**  
A neoplastic proliferation of Langerhans cells with overtly malignant cytologic features. It can be considered a higher grade variant of Langerhans cell histiocytosis (LCH) and it can present de novo or progress from antecedent LCH.

- 2B31.4 Interdigitating dendritic cell sarcoma**  
A neoplastic proliferation of spindle to ovoid cells which show phenotypic features similar to those of interdigitating dendritic cells. The clinical course is generally aggressive.
- 2B31.5 Follicular dendritic cell sarcoma**  
A neoplasm composed of spindle to ovoid cells which have morphologic and immunophenotypic characteristics of follicular dendritic cells. It affects lymph nodes and other sites including the tonsils, gastrointestinal tract, spleen, liver, soft tissues, skin, and oral cavity. It usually behaves as a low grade sarcoma. Recurrences have been reported in up to half of the cases.
- 2B31.6 Indeterminate cell histiocytosis**  
A very rare dendritic cell tumour composed of spindle to ovoid cells with a phenotype that is similar to the Langerhans cells. Patients usually present with cutaneous papules, nodules, and plaques. Systemic symptoms are usually absent. The clinical course is variable.
- 2B31.7 Fibroblastic reticular cell tumour**  
A very rare dendritic cell tumour affecting the lymph nodes, spleen, and soft tissues. Morphologically it is similar to the interdigitating dendritic cell sarcoma or follicular dendritic cell sarcoma. The tumour cells are positive for cytokeratin and CD68. Clinical outcome is variable.
- 2B31.Y Other specified histiocytic or dendritic cell neoplasms**
- 2B31.Z Histiocytic or dendritic cell neoplasms, unspecified**
- 2B32 Immunodeficiency-associated lymphoproliferative disorders**  
Post-transplant lymphoproliferative disorder (PTLD) is a polyclonal (benign) or clonal (malignant) proliferation of lymphoid cells that develops as a consequence of immunosuppression in a recipient of a solid organ or bone marrow allograft. PTLDs comprise a spectrum ranging from early, Epstein-Barr virus (EBV)-driven polyclonal lymphoid proliferations to EBV-positive or EBV-negative lymphomas of predominantly B-cell or less often T-cell type. In other immunodeficiency-associated lymphoproliferative disorders, association with EBV is less pronounced.
- Inclusions:** PTLD - [Post transplant lymphoproliferative disorder]
- 2B32.0 Post-transplant lymphoproliferative disorder, early lesion**  
A lymphoproliferative disorder arising as a result of post-transplant immunosuppression therapy. It is characterised by the lack of tissue destruction and the architectural preservation of the involved tissues. It includes two morphologic variants: plasmacytic hyperplasia and infectious mononucleosis-like lymphoproliferative disorders.
- 2B32.1 Reactive plasmacytic hyperplasia**
- 2B32.2 Post-transplant lymphoproliferative disorder, Infectious mononucleosis-like**
- 2B32.3 Polymorphic post-transplant lymphoproliferative disorder**
- 2B32.Y Other specified immunodeficiency-associated lymphoproliferative disorders**

**2B32.Z**      **Immunodeficiency-associated lymphoproliferative disorders, unspecified**

**2B33**      **Malignant haematopoietic neoplasms without further specification**

**Coding Note:** Only to be designated in cases with incomplete diagnostics.

**2B33.0**      **Acute leukaemia, not elsewhere classified**

**Coding Note:** Only to be designated in cases with incomplete diagnostics.

**2B33.1**      **Myeloid leukaemia**

**2B33.2**      **Chronic myeloid leukaemia, not elsewhere classified**

**Coding Note:** Only to be designated in cases with incomplete diagnostics

**2B33.3**      **Lymphoid leukaemia, not elsewhere classified**

**Coding Note:** Only to be designated in cases with incomplete diagnostics.

**2B33.4**      **Leukaemia, unspecified**

**Coding Note:** Only to be designated in cases with incomplete diagnostics.

**2B33.5**      **Malignant lymphoma, not elsewhere classified**

**Coding Note:** Only to be designated in cases with incomplete diagnostics.

**Coded Elsewhere:** Enteropathy associated T-cell lymphoma (2A90.7)

**2B33.Y**      **Other malignant haematopoietic neoplasms without further specification**

**Coding Note:** Only to be designated in cases with incomplete diagnostics.

**2B3Z**      **Neoplasms of haematopoietic or lymphoid tissues, unspecified**

Malignant neoplasms, except primary neoplasms of lymphoid, haematopoietic, central nervous system or related tissues (2B50-2E2Z)

**Coding Note:** For use of this category, reference should be made to the mortality coding rules and guidelines in the Reference Guide.

**Exclusions:** Neoplasms of brain or central nervous system (2A00-2A0Z)

Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

Malignant neoplasms, stated or presumed to be primary, of specified sites, except of lymphoid, haematopoietic, central nervous system or related tissues (2B50-2D3Z)

### Malignant mesenchymal neoplasms (2B50-2B5Z)

A usually aggressive malignant mesenchymal cell tumour most commonly arising from muscle, fat, fibrous tissue, bone, cartilage, and blood vessels. Sarcomas occur in both children and adults. The prognosis depends largely on the degree of differentiation (grade) of the tumour. Representative subtypes are liposarcoma, leiomyosarcoma, osteosarcoma, and chondrosarcoma.

**Exclusions:** Mesenchymal tumours of meninges (2A01.1)

Tumours of cranial or paraspinal nerves (2A02.1)

#### **2B50 Chondrosarcoma, primary site**

**Exclusions:** Osteosarcoma, primary site (2B51)

#### **2B50.0 Chondrosarcoma of bone or articular cartilage of limbs**

#### **2B50.1 Chondrosarcoma of bone or articular cartilage of pelvis**

#### **2B50.2 Chondrosarcoma of bone or articular cartilage of ribs, sternum or clavicle**

#### **2B50.Y Chondrosarcoma of bone or articular cartilage of other specified sites**

#### **2B50.Z Chondrosarcoma of bone or articular cartilage of unspecified sites**

#### **2B51 Osteosarcoma, primary site**

A usually aggressive malignant bone-forming mesenchymal tumour, predominantly affecting adolescents and young adults. It usually involves bones and less frequently extraosseous sites. It often involves the long bones (particularly distal femur, proximal tibia, and proximal humerus). Pain with or without a palpable mass is the most frequent clinical symptom. It may spread to other anatomic sites, particularly the lungs.

#### **2B51.0 Osteosarcoma of bone or articular cartilage of jaw**

#### **2B51.1 Osteosarcoma of bone or articular cartilage of limbs**

#### **2B51.2 Osteosarcoma of bone or articular cartilage of pelvis**

#### **2B51.Y Osteosarcoma of bone and articular cartilage of other specified sites**

#### **2B51.Z Osteosarcoma of bone and articular cartilage of unspecified sites**

**2B52****Ewing sarcoma, primary site**

A small round cell tumour that lacks morphologic, immunohistochemical, and electron microscopic evidence of neuroectodermal differentiation. It represents one of the two ends of the spectrum called Ewing's sarcoma/peripheral neuroectodermal tumour. It affects mostly males under age 20, and it can occur in soft tissue or bone. Pain and the presence of a mass are the most common clinical symptoms.

**2B52.0****Ewing sarcoma of bone or articular cartilage of limbs****2B52.1****Ewing sarcoma of bone or articular cartilage of pelvis****2B52.2****Ewing sarcoma of bone or articular cartilage of ribs****2B52.3****Ewing sarcoma of soft tissue**

A rare malignant neoplasm of the soft tissues. It is typically a disease of children and young adults. It is characterised by t(11:22) (q24: q12) resulting in the expression of EWS/FLI-1 chimeric transcript. Most commonly occurs in the paravertebral region, chest wall, pelvis and lower extremities.

**2B52.Y****Ewing sarcoma of bone and articular cartilage of other specified sites****2B52.Z****Ewing sarcoma of bone and articular cartilage of unspecified sites****2B53****Fibroblastic or myofibroblastic tumour, primary site****2B53.0****Myxofibrosarcoma, primary site****2B53.1****Fibroblastic or myofibroblastic tumour of skin****2B53.Y****Other specified fibroblastic or myofibroblastic tumour, primary site****2B53.Z****Fibroblastic or myofibroblastic tumour, primary site, unspecified****2B54****Unclassified pleomorphic sarcoma, primary site**

A pleomorphic sarcoma characterised by the presence of fibrohistiocytic cells and spindle cells arranged in a storiform pattern.

**2B54.0****Unclassified pleomorphic sarcoma of skin**

A rare malignant neoplasm arising from the skin. It is characterised by the presence of spindle cells in a storiform pattern and histiocytes with abundant cytoplasm.

*Inclusions:* malignant fibrous histiocytoma of skin

**2B54.1****Unclassified pleomorphic sarcoma of retroperitoneum or peritoneum****2B54.Y****Unclassified pleomorphic sarcoma, primary site, other specified site****2B54.Z****Unclassified pleomorphic sarcoma, primary site, unspecified site****2B55****Rhabdomyosarcoma, primary site**

Rhabdomyosarcoma is a malignant soft tissue tumour which develops from cells of striated muscle. It is the most common form of tumour found in children and adolescents.

**2B55.0****Rhabdomyosarcoma of the oral cavity or pharynx**

- 2B55.1** **Rhabdomyosarcoma of respiratory or intrathoracic organs**
- 2B55.2** **Rhabdomyosarcoma of male genital organs**
- 2B55.Y** **Rhabdomyosarcoma, other specified primary site**
- 2B55.Z** **Rhabdomyosarcoma, unspecified primary site**
- 2B56** **Angiosarcoma, primary site**
- 2B56.0** **Angiosarcoma of heart**
- 2B56.1** **Angiosarcoma of skin**  
A malignant tumour arising from the endothelial cells of the blood vessels. Microscopically, it is characterised by frequently open vascular anastomosing and branching channels. The malignant cells that line the vascular channels are spindle or epithelioid and often display hyperchromatic nuclei. Angiosarcomas most frequently occur in the skin and breast. Patients with long-standing lymphoedema are at increased risk of developing angiosarcoma.
- 2B56.2** **Angiosarcoma of breast**  
A malignant vascular neoplasm arising from the breast.
- 2B56.3** **Angiosarcoma of liver**  
A malignant vascular neoplasm arising from the liver.  
*Inclusions:* Kupffer cell sarcoma of liver
- 2B56.Y** **Angiosarcoma, other specified primary site**
- 2B56.Z** **Angiosarcoma, unspecified primary site**
- 2B57** **Kaposi sarcoma, primary site**  
A malignant neoplasm characterised by a vascular proliferation which usually contains blunt endothelial cells. Erythrocyte extravasation and hemosiderin deposition are frequently present. The most frequent site of involvement is the skin; however it may also occur internally. It generally develops in people with compromised immune systems including those with acquired immune deficiency syndrome (AIDS).
- 2B57.0** **Kaposi sarcoma of lung**
- 2B57.1** **Kaposi sarcoma of skin**  
A Kaposi sarcoma arising from the skin. It presents with patches, plaques, or nodules.
- 2B57.2** **Kaposi sarcoma of gastrointestinal sites**
- 2B57.Y** **Kaposi sarcoma of other specified primary sites**
- 2B57.Z** **Kaposi sarcoma of unspecified primary site**
- 2B58** **Leiomyosarcoma, primary site**
- 2B58.0** **Leiomyosarcoma of retroperitoneum or peritoneum**

- 2B58.1** **Leiomyosarcoma of uterus**
- 2B58.2** **Leiomyosarcoma of stomach**  
This is a malignant nonepithelial tumour that arises from cells lining the stomach that develop into smooth-muscle.
- 2B58.Y** **Leiomyosarcoma, other specified primary site**
- 2B58.Z** **Leiomyosarcoma, unspecified primary site**
- 2B59** **Liposarcoma, primary site**  
Liposarcoma, a type of soft tissue sarcoma, describes a group of lipomatous tumours of varying severity ranging from slow-growing to aggressive and metastatic. Liposarcomas are most often located in the lower extremities or retroperitoneum, but they can also occur in the upper extremities, neck, peritoneal cavity, spermatic cord, breast, vulva and axilla.
- 2B59.0** **Liposarcoma of soft tissue of limb**
- 2B59.1** **Liposarcoma of retroperitoneum or peritoneum**
- 2B59.2** **Liposarcoma of male genital organs**
- 2B59.Y** **Liposarcoma, other specified primary site**
- 2B59.Z** **Liposarcoma, unspecified primary site**
- 2B5A** **Synovial sarcoma, primary site**  
A malignant neoplasm characterised by the chromosomal translocation t(X;18)(p11;q11). It can occur at any age, but mainly affects young adults, more commonly males. Although any site can be affected, the vast majority of the cases arise in the deep soft tissues of extremities, especially around the knee. Microscopically, synovial sarcoma is classified as monophasic (with a spindle or epithelial cell component) or biphasic (with both spindle and epithelial cell components). Synovial sarcomas can recur or metastasize to the lungs, bones, and lymph nodes.
- 2B5A.0** **Synovial sarcoma of soft tissues of limb**
- 2B5A.1** **Synovial sarcoma of respiratory or intra-thoracic organs**
- 2B5A.Y** **Synovial sarcoma, other specified primary site**
- 2B5A.Z** **Synovial sarcoma, unspecified primary site**
- 2B5B** **Gastrointestinal stromal tumour, primary site**  
This is the most common mesenchymal tumour that arises in the gastrointestinal tract. It is generally immunohistochemically positive for CD117 (KIT), phenotypically paralleling Cajal-cell differentiation, and most examples contain KIT- or PDGFRA-activating mutations. It is most frequent in the stomach and to a lesser degree in the small intestine. The prognosis depends on the tumour size and the mitotic activity.

- 2B5B.0 Gastrointestinal stromal tumour of stomach**  
A gastrointestinal stromal tumour that arises from the stomach. It covers a spectrum of benign to malignant mesenchymal neoplasms and includes most gastric smooth muscle tumours, leiomyoblastomas, and tumours formerly called gastrointestinal autonomic nerve tumours.
- 2B5B.1 Gastrointestinal stromal tumour of small intestine**  
A gastrointestinal stromal tumour that arises from the small intestine. It usually affects adults over fifty years of age. The majority of cases have spindle cell morphology. The prognosis depends on the tumour size and the mitotic activity.
- 2B5B.Y Gastrointestinal stromal tumour of other gastrointestinal sites**
- 2B5B.Z Gastrointestinal stromal tumour of unspecified gastrointestinal sites**
- 2B5C Endometrial stromal sarcoma, primary site**  
A malignant, infiltrating mesenchymal tumour arising from the uterine corpus, cervix, vagina, and the ovary. Based on its morphologic characteristics, it is classified as either a low grade or an undifferentiated (high grade) stromal sarcoma. The low grade endometrioid stromal sarcoma is characterised by the presence of oval to spindle-shape cells that resemble the cells of the endometrial stroma, without evidence of significant atypia and pleomorphism. Numerous small vessels are also present. The undifferentiated stromal sarcoma is characterised by an aggressive clinical course, the presence of significant cellular atypia, pleomorphism, and high mitotic activity.
- 2B5D Malignant mixed epithelial mesenchymal tumour, primary site**
- 2B5D.0 Malignant mixed epithelial mesenchymal tumour of ovary**  
Malignant mixed epithelial mesenchymal tumour of the ovary is a rare and very aggressive neoplasm presenting most commonly in postmenopausal women and is composed of adenocarcinomatous and sarcomatous elements and, depending on the types of these elements, can be classified as homologous or heterologous. It often has a poor prognosis.
- 2B5D.1 Malignant mixed epithelial and mesenchymal tumour of corpus uteri**  
A primary malignant neoplasm of the uterine corpus characterised by the presence of an epithelial and a mesenchymal component. This category includes carcinosarcoma, carcinofibroma, and adenosarcoma.
- 2B5D.Y Malignant mixed epithelial mesenchymal tumour, other specified primary site**
- 2B5D.Z Malignant mixed epithelial mesenchymal tumour, unspecified primary site**
- 2B5E Malignant nerve sheath tumour of peripheral nerves or autonomic nervous system, primary site**  
**Exclusions:** Malignant peripheral nerve sheath tumour of cranial or paraspinal nerves (2A02.10)
- 2B5F Sarcoma, not elsewhere classified, primary site**

### Malignant neoplasms of lip, oral cavity or pharynx (2B60-2B6Y)

Squamous cell carcinomas amount to more than 90% of malignant tumours of the oral cavity and oropharynx. As in other parts of the upper aerodigestive tract, there is a strong and synergistic association with tobacco smoking and alcohol abuse. In some regions, particularly the Indian subcontinent, oral cancer is among the most frequent malignancies, largely due to tobacco chewing.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

#### **2B60      Malignant neoplasms of lip**

Malignant neoplasms originating from the transitional epithelium of the lip (excluding oral mucosa and skin of the outer lip) or from the underlying anatomical structures (e.g. orbicularis oris muscle).

**Exclusions:** Malignant neoplasm of skin of lip (2C30-2C3Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

<b>2B60.0</b>	<b>Basal cell carcinoma of lip</b> A basal cell carcinoma arising from the lip.
<b>2B60.1</b>	<b>Squamous cell carcinoma of lip</b> Squamous cell carcinoma located on or originating in the mucosa or vermillion of the lip, including the vermillion border but excluding the skin of the lip.  <b>Exclusions:</b> Squamous cell carcinoma of skin of lip (2C31)
<b>2B60.Y</b>	<b>Other specified malignant neoplasms of lip</b>
<b>2B60.Z</b>	<b>Malignant neoplasms of lip, unspecified</b>
<b>2B61</b>	<b>Malignant neoplasms of base of tongue</b> A primary neoplasm involving the base of the tongue, often associated with chronic alcohol and tobacco use, older age, certain geographic locations, a family history of upper aerodigestive tract cancers and/or certain nutritional deficiencies and infectious agents.  <b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z)
<b>2B61.0</b>	<b>Squamous cell carcinoma of the base of the tongue</b> A carcinoma that arises from the base of the tongue. Representative examples include squamous cell carcinoma, adenoid cystic carcinoma, and mucoepidermoid carcinoma.

<b>2B67</b>	<b>Malignant neoplasms of parotid gland</b>
	Salivary gland tumours can show a striking range of morphological diversity between different tumour types and sometimes within an individual tumour mass. In addition, hybrid tumours, dedifferentiation and the propensity for some benign tumours to progress to malignancy can confound histopathological interpretation. These features, together with the relative rarity of a number of tumours, can sometimes make diagnosis difficult, despite the abundance of named tumour entities. The increasing use of pre-operative fine needle aspiration biopsies also needs to be taken into account, as artifactual changes may be superimposed on the tumours. Unfortunately, the morphological variability of these tumours is mirrored by the immunocytochemical profiles, so that special stains are rarely useful in routine diagnosis of salivary gland epithelial neoplasms.
	<i><b>Exclusions:</b></i> Malignant mesenchymal neoplasms (2B50-2B5Z)
<b>2B67.0</b>	<b>Adenocarcinoma of parotid gland</b>

<b>2B6A.0</b>	<b>Squamous cell carcinoma of oropharynx</b> A squamous cell carcinoma arising from the oropharynx. It predominantly affects adults in their fifth and sixth decades of life and is associated with alcohol and tobacco use. Human papillomavirus is present in approximately half of the cases. It is characterised by a tendency to metastasize early to the lymph nodes. When the tumour is small, patients are often asymptomatic. Physical examination may reveal erythematous or white lesions or plaques. The majority of patients present with locally advanced disease. Signs and symptoms include mucosal ulceration, pain, bleeding, weight loss, neck swelling, and difficulty speaking, chewing, and swallowing. Patients may also present with swollen neck lymph nodes without any symptoms from the oropharyngeal tumour. The most significant prognostic factors are the size of the tumour and the lymph nodes status.
<b>2B6A.Y</b>	<b>Other specified malignant neoplasms of oropharynx</b>
<b>2B6A.Z</b>	<b>Malignant neoplasms of oropharynx, unspecified</b>
<b>2B6B</b>	<b>Malignant neoplasms of nasopharynx</b> A wide variety of tumours can arise in the nasopharynx, but it is nasopharyngeal carcinoma that has fascinated generations of oncologists, pathologists, scientists and epidemiologists. It shows marked geographic differences, with highest incidence rates in Southern China. In some endemic areas, the incidence has declined by about 30% over the past two decades, suggesting that environmental or lifestyle factors may play a major role and that the disease is, to some extent, preventable. Nasopharyngeal carcinoma shows a very strong association with Epstein-Barr virus (EBV) infection, irrespective of the ethnic origin of the patients. This association has pioneered a new paradigm of utilizing viral serological tests for the diagnosis of cancer and for screening in high-risk populations. Nasopharyngeal carcinoma is generally responsive to radiation therapy, and the clinical outcome has greatly improved over the years, due to refinements in staging and to improved therapy protocols. The unusual and often deceptive histological features of nasopharyngeal carcinoma have generated controversies over the nature of the tumour and still pose a challenge to surgical pathologists. There have possibly been more names invented for the various histological subtypes of nasopharyngeal carcinoma than any other tumour type.
	<b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z)
<b>2B6B.0</b>	<b>Squamous cell carcinoma of nasopharynx</b>

## Malignant neoplasms of digestive organs (2B70-2C1Z)

A primary malignant neoplasm involving any part of the gastrointestinal system.

**Exclusions:** Malignant neoplasm metastasis in digestive system (2D80-2D8Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

Malignant neoplasms of lip, oral cavity or pharynx (2B60-2B6Y)

**2B70**

### **Malignant neoplasms of oesophagus**

A primary malignant neoplasm involving the oesophagus

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2B70.0**

### **Adenocarcinoma of oesophagus**

A malignant tumour with glandular differentiation arising predominantly from Barrett mucosa in the lower third of the esophagus. Grossly, esophageal adenocarcinomas are similar to esophageal squamous cell carcinomas. Microscopically, adenocarcinomas arising in the setting of Barrett esophagus are typically papillary and/or tubular. The prognosis is poor.

**2B70.00**

#### Barrett adenocarcinoma

Barrett adenocarcinoma is defined as adenocarcinoma of lower oesophagus and gastroesophageal junction associated with Barrett's oesophagus.

**2B70.0Y**

#### Other specified adenocarcinoma of oesophagus

**2B70.0Z**

#### Adenocarcinoma of oesophagus, unspecified

**2B70.1**

### **Squamous cell carcinoma of oesophagus**

A squamous cell carcinoma arising from the esophagus. It can be associated with a long history of tobacco and alcohol abuse and is exceedingly rare before the age of 30. The median age is around 65 in both males and females, but the incidence in males is much higher than in females. It is located mostly in the middle and lower third of the esophagus. Grossly, polypoid, ulcerated, plaque-like and occult lesions have been described. The microscopic features are the same as in other squamous cell carcinomas. Any degree of differentiation may occur, and variation within a single tumour is common. The prognosis is poor.

**2B70.Y**

#### Other specified malignant neoplasms of oesophagus

**2B70.Z**

#### Malignant neoplasms of oesophagus, unspecified

**2B71**

### **Malignant neoplasms of oesophagogastric junction**

Malignant neoplasms that arise from the cells of the oesophagogastric junction (OGJ), which is defined as the point at which the oesophagus ends and the stomach begins. This mainly defines adenocarcinomas that straddle the junction of the oesophagus and stomach. This definition includes many tumours formally called cancers of the gastric cardia.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

<b>2B71.0</b>	<b>Adenocarcinoma of oesophagogastric junction</b> An adenocarcinoma that arises from and straddles the junction of the stomach and esophagus. The category of adenocarcinomas of the gastroesophageal junction also includes the majority of adenocarcinomas previously called gastric cardia adenocarcinomas. Squamous cell carcinomas that affect or cross the junction of the stomach and esophagus are classified as carcinomas of the distal esophagus. Adenocarcinoma of the gastroesophageal junction occurs more often in Caucasian middle aged and elderly males. Clinical signs and symptoms include dysphagia, abdominal pain, and weight loss. The prognosis depends on the completeness of the surgical resection, the number of lymph nodes involved by cancer, and the presence or absence of postoperative complications.
<b>2B71.Y</b>	<b>Other specified malignant neoplasm of oesophagogastric junction</b>
<b>2B71.Z</b>	<b>Malignant neoplasms of oesophagogastric junction, unspecified</b>
<b>2B72</b>	<p><b>Malignant neoplasms of stomach</b> A primary or metastatic malignant neoplasm involving the stomach.</p> <p><b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z)</p> <p><b>Coded Elsewhere:</b> Extranodal marginal zone B-cell lymphoma of mucosa-associated lymphoid tissue of stomach (2A85.1) Leiomyosarcoma of stomach (2B58.2) Gastrointestinal stromal tumour of stomach (2B5B.0) Gastric malignant lymphoma (2B33.5)</p>
<b>2B72.0</b>	<b>Adenocarcinoma of stomach</b> An adenocarcinoma arising from the stomach glandular epithelium. Gastric adenocarcinoma is primarily a disease of older individuals. It most commonly develops after a long period of atrophic gastritis and is strongly associated with Helicobacter pylori infection. The lack of early symptoms often delays the diagnosis of gastric cancer. The majority of patients present with advanced tumours which have poor rates of curability. Microscopically, two important histologic types of gastric adenocarcinoma are recognised: the intestinal and diffuse type. The overall prognosis of gastric adenocarcinomas is poor, even in patients who receive a curative resection.
<b>2B72.1</b>	<b>Malignant neuroendocrine neoplasm of stomach</b> A neoplasm with neuroendocrine differentiation that arises from the stomach. It includes well differentiated neuroendocrine tumours (low and intermediate grade) and poorly differentiated neuroendocrine carcinomas (high grade).
	<p><b>Inclusions:</b> carcinoid and other malignant neuroendocrine neoplasms</p> <p><b>Coded Elsewhere:</b> Neuroendocrine neoplasm of duodenum (2B80.01) Neuroendocrine neoplasms of appendix (2B81.2)</p>
<b>2B72.Y</b>	<b>Other specified malignant neoplasms of stomach</b>
<b>2B72.Z</b>	<b>Malignant neoplasms of stomach, unspecified</b>

Malignant neoplasms of intestine (2B80-2C0Z)

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2B80**

**Malignant neoplasms of small intestine**

A primary malignant neoplasm involving the small intestine.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**Coded Elsewhere:** Enteropathy associated T-cell lymphoma (2A90.7)

Gastrointestinal stromal tumour of small intestine (2B5B.1)

Malignant lymphoma of small intestine (2B33.5)

Malignant neoplasm of ileum (2B80.1Z)

Small intestinal leiomyosarcoma (2B58.Y)

**2B80.0**

**Malignant neoplasms of duodenum**

A primary malignant neoplasm that affects the duodenum. Representative examples include carcinoma, lymphoma, and sarcoma.

**Coded Elsewhere:** Lymphoma of duodenum (2B33.5)

Malignant mesenchymal tumour of the duodenum (2B5F.2)

**2B80.00**

Adenocarcinoma of duodenum

An adenocarcinoma that arises from the duodenum.

**2B80.01**

Neuroendocrine neoplasm of duodenum

Neoplasms that arise from the cells of neuroendocrine system lining the duodenum.

**2B80.0Y**

Other specified malignant neoplasms of the duodenum

**2B80.0Z**

Malignant neoplasms of duodenum, unspecified

**2B80.1**

**Malignant neoplasms of jejunum or ileum**

**2B80.10**

Adenocarcinoma of jejunum or ileum

**2B80.11**

Neuroendocrine neoplasms of jejunum or ileum

Neoplasms that arise from the cells of neuroendocrine system lining the jejunum or ileum including well-differentiated (low- to intermediate grade) neuroendocrine tumours. These include carcinoid tumour.

**2B80.1Y**

Other specified malignant neoplasms of jejunum or ileum

**2B80.1Z**

Malignant neoplasms of jejunum or ileum, unspecified

**2B80.2**

**Malignant neoplasms of small intestine, site unspecified**

**2B80.20**

Adenocarcinoma of small intestine, site unspecified

A malignant tumour with glandular differentiation arising from epithelium of small intestine.

**Exclusions:** Neuroendocrine neoplasms of small intestine, site unspecified (2B80.21)

- 2B80.21** Neuroendocrine neoplasms of small intestine, site unspecified  
Neoplasms that arise from the cells of neuroendocrine system lining the small intestine.
- 2B80.2Y** Other specified malignant neoplasms of small intestine, site unspecified
- 2B80.Y** **Other specified malignant neoplasms of small intestine**
- 2B80.Z** **Malignant neoplasms of small intestine, unspecified**
- 2B81** **Malignant neoplasms of appendix**  
A primary malignant neoplasm that affects the appendix.
- Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)
- Coded Elsewhere:** Lymphoma of the appendix (2B33.5)
- 2B81.0** **Adenocarcinoma of appendix**  
A malignant neoplasm arising from the glandular epithelium of the appendix. Most are mucinous adenocarcinomas.
- 2B81.00** Mucinous adenocarcinoma of appendix  
An adenocarcinoma, often cystic, with large amounts of extracellular mucin
- 2B81.2** **Neuroendocrine neoplasms of appendix**  
Malignant neoplasms with neuroendocrine differentiation that arise in the appendix. Most are well differentiated neuroendocrine tumours (low and intermediate grade), i.e. carcinoids. Poorly differentiated neuroendocrine carcinomas (high grade) are exceedingly rare.
- 2B81.Y** **Other specified malignant neoplasms of appendix**
- 2B81.Z** **Malignant neoplasms of appendix, unspecified**
- Malignant neoplasms of large intestine (2B90-2B9Y)**
- Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)
- 2B90** **Malignant neoplasms of colon**  
Primary malignant neoplasms arising in the colon.
- Exclusions:** Malignant neoplasms of appendix (2B81)
- Coded Elsewhere:** Gardner syndrome (LD2D.3)  
Malignant Lymphoma of colon (2B33.5)  
Gastrointestinal stromal tumour of colon (2B5B.Y)

**2C00**

**Malignant neoplasms of anus or anal canal**

A primary malignant neoplasm that arises in the anal canal up to the junction with perianal, hair-bearing skin. Representative examples include carcinomas and melanomas. Tumours of the anal margin are classified with skin tumours.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C00.0**

**Adenocarcinoma of anus or anal canal**

An adenocarcinoma arising in the anal canal epithelium, including the mucosal surface, the anal glands, and the lining of fistulous tracts.

**2C00.1**

**Melanoma of anus or anal canal**

A form of cancer that develops in melanocytes, the cells that produce pigment melanin in the skin.

**2C00.2**

**Neuroendocrine neoplasm of anus or anal canal**

Neoplasms that arise from the cells of the neuroendocrine system lining the anus and anal canal.

<b>2C00.3</b>	<b>Squamous cell carcinoma of anus or anal canal</b> A squamous cell carcinoma (SCC) arising from the anal canal up to the junction with the anal margin (perianal, hair-bearing skin). Human papillomavirus is detected in the majority of cases. Homosexual HIV-positive men have an increased risk of developing anal squamous cell carcinoma in comparison to the general male population. The prognosis is generally better for anal margin SCC than for anal canal SCC. The former are classified with skin tumours.
<b>2C00.Y</b>	<b>Other specified malignant neoplasms of anus and anal canal</b>
<b>2C00.Z</b>	<b>Malignant neoplasms of anus or anal canal, unspecified</b>
<b>2C0Y</b>	<b>Other specified malignant neoplasms of intestine</b>

**2C12****Malignant neoplasms of liver or intrahepatic bile ducts**

The most frequent and important hepatic neoplasm is the primary hepatocellular carcinoma (HCC). In many parts of the world, in particular Africa and Asia, it poses a significant disease burden. In these high incidence regions, chronic infection with hepatitis B virus (HBV) is the principal underlying cause, with the exception of Japan which has a high prevalence of hepatitis C infection. HBV vaccination has become a powerful tool in reducing cirrhosis and HCC, but implementation is still suboptimal in several high risk regions. In Western countries, chronic alcohol abuse is a major aetiological factor. Hepatic cholangiocarcinoma has a different geographical distribution, with peak incidences in Northern Thailand. Here, it is caused by chronic infection with the liver fluke, *Opisthorchis viverrini*, which is ingested through infected raw fish.

**Exclusions:** Secondary malignant neoplasm of liver (2D80)  
Malignant neoplasm of biliary tract NOS (2C17)

**2C12.0****Malignant neoplasm of liver****2C12.00**

Combined hepatocellular-cholangiocarcinoma

Combined hepatocellular-cholangiocarcinoma is a tumour containing unequivocal, intimately mixed elements of both hepatocellular carcinoma and cholangiocarcinoma.

**Inclusions:** Hepatocholangiocarcinoma

**2C12.01**

Hepatoblastoma

A malignant liver neoplasm that occurs almost exclusively in infants, although isolated cases in older children and adults have been reported. Grossly, hepatoblastoma is solid, well circumscribed, and more often solitary than multiple. Microscopically, most of the tumours are composed exclusively of immature hepatocytic elements. About a fourth of hepatoblastomas contain a stromal component that may be undifferentiated or develop into bone or cartilage.

**2C12.02**

Hepatocellular carcinoma of liver

A carcinoma that arises from the hepatocytes.

**2C12.03**

Mesothelial carcinoma of liver

**2C12.0Z**

Malignant neoplasm of liver, unspecified

**2C12.1****Malignant neoplasm of intrahepatic bile ducts****2C12.10**

Intrahepatic cholangiocarcinoma

A carcinoma that arises from the intrahepatic bile duct epithelium in any site of the intrahepatic biliary tree. Grossly, the malignant lesions are solid, nodular, and grayish. Morphologically, the vast majority of cases are adenocarcinomas. Early detection is difficult and the prognosis is generally poor.

**2C12.1Y**

Other specified malignant neoplasms of intrahepatic bile ducts

**2C12.1Z**

Malignant neoplasm of intrahepatic bile ducts, unspecified

**2C13****Malignant neoplasms of gallbladder**

A malignant tumour arising from the epithelium of the gallbladder. It is usually associated with the presence of gallstones. Clinical symptoms are not specific and usually present late in the course. Morphologically, adenocarcinoma is the most common type, however squamous cell carcinomas, adenosquamous carcinomas, signet ring carcinomas, and undifferentiated carcinomas can also occur.

**2C13.0****Adenocarcinoma of the gallbladder**

An adenocarcinoma arising from the gallbladder. It is the most common malignant tumour of the gallbladder, typically in the fundus; it is usually well to moderately differentiated. The incidence is higher in patients with gallstones than in patients without gallstones. Signs and symptoms usually present late in the course of the disease and are reminiscent of those of chronic cholecystitis including right upper quadrant pain. Histologic variants include adenocarcinoma of the intestinal type, clear cell adenocarcinoma, mucinous adenocarcinoma, papillary adenocarcinoma, and signet ring adenocarcinoma.

**2C13.Y****Other specified malignant neoplasm of gallbladder****2C13.Z****Malignant neoplasms of gallbladder, unspecified****2C14****Malignant neoplasms of proximal biliary tract, cystic duct****2C14.0****Adenocarcinoma of proximal biliary tract, cystic duct****2C14.1****Mucinous cystic neoplasm with associated invasive carcinoma of cystic duct****2C14.2****Neuroendocrine neoplasms of cystic duct****2C14.Y****Other specified malignant neoplasms of biliary tract, cystic duct****2C14.Z****Malignant neoplasms of proximal biliary tract, cystic duct, unspecified****2C15****Malignant neoplasms of biliary tract, distal bile duct****2C15.0****Adenocarcinoma of biliary tract, distal bile duct**

An adenocarcinoma that arises from the common bile duct distal to the insertion of the cystic duct.

**2C15.1****Mucinous cystic neoplasm with associated invasive carcinoma of distal bile duct****2C15.2****Neuroendocrine neoplasms of distal bile duct****2C15.Y****Other specified malignant neoplasms of biliary tract, distal bile duct****2C15.Z****Malignant neoplasms of biliary tract, distal bile duct, unspecified****2C16****Malignant neoplasms of ampulla of Vater****2C16.0****Adenocarcinoma of ampulla of Vater**

## Malignant neoplasms of middle ear, respiratory or intrathoracic organs (2C20-2C2Z)

- Exclusions:**
- Mesotheliomas of peritoneum (2C51.2)
  - Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C20**

### **Malignant neoplasms of nasal cavity**

From the chapter on Nasal Cavity (H&N BB) Although the nasal cavity and paranasal sinuses occupy a relatively small anatomical space, they are the site of origin of some of the more complex, histologically diverse group of tumours in the entire human body. These include neoplasms derived from mucosal epithelium, seromucinous glands, soft tissues, bone, cartilage, neural/neuroectodermal tissue, haematolymphoid cells and the odontogenic apparatus. Many of the tumours are similar to those found elsewhere in the body but a few, such as the olfactory neuroblastoma, are unique to this site.

- Exclusions:**
- Malignant neoplasm of nose NOS (2C29)
  - Malignant neoplasm of olfactory bulb (2A02)
  - Malignant neoplasm of posterior margin of nasal septum and choana (2B6B)
  - Malignant neoplasm of skin of nose (2C30-2C3Z)
  - Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C26**

**Malignant neoplasms of the pleura**

A primary or metastatic malignant neoplasm affecting the pleura. A representative example of primary malignant pleural neoplasm is the malignant pleural mesothelioma. A representative example of metastatic malignant neoplasm to the pleura is when a metastatic carcinoma has spread to the pleura from another anatomic site.

**Exclusions:**      Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C26.0      Mesothelioma of pleura**

Malignant mesothelioma is a fatal asbestos-associated malignancy arising in the lining cells (mesothelium) of the pleural and peritoneal cavities, as well as in the pericardium and the tunica vaginalis.

**2C26.Y      Other specified malignant neoplasms of the pleura**

**2C26.Z      Malignant neoplasms of the pleura, unspecified**

**2C27**

**Malignant neoplasms of thymus**

Primary malignant neoplasm involving the thymus. This category includes malignant thymomas, primary thymic carcinomas and carcinoid tumour or other neuroendocrine neoplasms of thymus.

**Exclusions:**      Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C27.0      Carcinoma of thymus**

A diverse group of carcinomas of the thymus gland, previously known as thymoma type C. It includes morphologic variants derived from purely epithelial cells, as well as from cells with neuroendocrine differentiation.

**2C27.1      Carcinoid tumour or other neuroendocrine neoplasms of thymus**

Thymic neuroendocrine carcinoma is a type of thymic epithelial neoplasm displaying evidence of neuroendocrine differentiation.

**2C27.2      Malignant thymoma**

A thymoma that has an aggressive clinical course (capsular invasion, infiltration of the surrounding tissues) and can metastasize. Although any morphologic subtype of thymoma may eventually have a malignant clinical course, this term is most often associated with thymoma types B3 and C.

**2C27.Y      Other specified malignant neoplasms of thymus**

**2C27.Z      Malignant neoplasms of thymus, unspecified**

<b>2C28</b>	<b>Malignant neoplasms of heart, mediastinum or non-mesothelioma of pleura</b>

<b>2C2Z</b>	<b>Malignant neoplasms of middle ear, respiratory or intrathoracic organs, unspecified</b>

### Malignant neoplasms of skin (2C30-2C3Z)

A primary or metastatic tumour involving the skin. Primary malignant skin tumours most often are carcinomas (either basal cell or squamous cell carcinomas that arise from cells in the epidermis) or melanomas that arise from pigment-containing skin melanocytes. Metastatic tumours to the skin include carcinomas and lymphomas.

- Exclusions:***
- Carcinoma in situ of skin (2E64)
  - Metastatic malignant neoplasm involving skin (2E08)
  - Malignant mesenchymal neoplasms (2B50-2B5Z)

<b>2C30</b>	<b>Melanoma of skin</b>
	A primary melanoma arising from atypical melanocytes in the skin. Precursor lesions include acquired and congenital melanocytic nevi, and dysplastic nevi. Several histologic variants have been recognised, including superficial spreading melanoma, acral lentiginous melanoma, nodular melanoma, and lentigo maligna melanoma.

- Exclusions:***
- Melanoma of penis (2C81.1)
  - Melanoma of vulva (2C70.1)

- 2C30.0      Superficial spreading melanoma, primary**  
The commonest form of melanoma, superficial spreading malignant melanoma accounts for about 70 per cent of all melanomas. It characteristically presents as an asymptomatic pigmented cutaneous macule which is asymmetrical in shape and displays variability in both hue and pigment intensity. It has a relatively long phase of progressive superficial extension (radial growth) before penetrating deeper into the dermis and entering an invasive vertical growth phase.
- 2C30.1      Nodular melanoma, primary**  
Variant of melanoma carrying a poor prognosis due to the fact that there is little or no prodromal radial (superficial) growth phase before deep invasion (vertical growth). The lesion presents as an elevated, reddish, bluish or dark brown coloured, dome-shaped tumour. Ulceration or bleeding from the lesion occurs frequently. It occurs most frequently in the fifth or sixth decade.
- 2C30.2      Lentigo maligna melanoma, primary**  
Lentigo maligna malignant melanoma is a form of melanoma which occurs within a lentigo maligna when neoplastic cells no longer remain confined to the epidermis (in situ radial growth) but invade the dermis (vertical growth). The lentigo maligna from which it arises may have been present as an irregularly pigmented macule on sun-exposed skin for many years before dermal invasion supervenes. Clinical differentiation from lentigo maligna may not be possible in the early stages of invasion but as the tumour progresses a focal thickening or nodule within the lentigo maligna will become apparent.
- Exclusions:**      Lentigo maligna (2E63.00)
- 2C30.3      Acral lentiginous melanoma, primary**  
Acral lentiginous malignant melanoma is a distinct and uncommon form of melanoma affecting either palmar and plantar skin or the nail apparatus. It is usually preceded by a slowly progressive in situ phase which may be overlooked. It typically presents either as an enlarging area of macular pigmentation on the palms and soles or as a longitudinal pigmented band within the nail plate. More aggressive tumours present as ulcerated nodules which, when involving the nail apparatus, can destroy the nail plate. Acral lentiginous malignant melanoma accounts for a high proportion of melanomas seen in dark-skinned people.
- 2C30.Y      Other specified melanoma of skin**
- 2C30.Z      Melanoma of skin, unspecified**
- 2C31      Squamous cell carcinoma of skin**  
A carcinoma arising from the squamous cells of the epidermis. Skin squamous cell carcinoma is most commonly found on sun-exposed areas. The majority of the tumours are well-differentiated.
- Coded Elsewhere:** Squamous cell carcinoma of penis (2C81.0)

- 2C31.0** **Verrucous squamous cell carcinoma of skin**  
Verrucous squamous cell carcinoma is a rare variant of well-differentiated squamous cell carcinoma with low malignant potential. It occurs principally on the glans and prepuce of the penis and on the sole of the foot.
- Exclusions:** Verrucous squamous cell carcinoma of vulva (2C70.2)
- 2C31.1** **Keratoacanthoma**  
Keratoacanthoma is a relatively common keratinocytic epidermal tumour which shows resemblances to squamous cell carcinoma of the skin, from which it may be difficult to distinguish either clinically or histopathologically. It is characterised by rapid growth over a few weeks to months, followed by spontaneous resolution over 4-6 months. Because it is not possible to predict its benign behaviour with complete certainty during its initial growth phase, the designation "Well-differentiated squamous cell carcinoma (keratoacanthoma type)" is also used.
- 2C31.Z** **Cutaneous squamous cell carcinoma**
- 2C32** **Basal cell carcinoma of skin**  
Basal cell carcinoma or BCC is the most common malignancy in humans. It is believed that BCCs arise from pluripotential cells in the basal layer of the epidermis or, less commonly, hair follicle. BCCs typically occur in areas of chronic sun exposure and present as slowly enlarging reddish papules, plaques or nodules on the head and neck, although the superficial variant is often located on the trunk. BCCs frequently ulcerate and become crusted. Although they rarely metastasize, they can cause significant local destruction and disfigurement if neglected or inadequately treated, particularly if of the sclerosing or infiltrative subtype.
- 2C32.0** **Nodular basal cell carcinoma of skin**  
This is the most common form of basal cell carcinoma and is typically located on the head or neck. It starts as a small translucent nodule which will frequently necrose and ulcerate as it enlarges. Telangiectatic blood vessels can often be detected just under the tumour surface. A minority may be pigmented and give rise to difficulty in distinguishing them from melanoma.
- 2C32.1** **Sclerosing basal cell carcinoma of skin**  
This form of basal cell carcinoma is composed of thin strands, cords and columns of malignant cells which infiltrate between collagen bundles of the dermis. It may infiltrate widely and deeply before it becomes clinically obvious. It typically starts as a pale, poorly-defined indurated plaque which may not come to medical attention until it starts to bleed and crust.
- 2C32.2** **Superficial basal cell carcinoma of skin**  
Superficial basal cell carcinomas are often multiple and appear as pink or red barely elevated patches varying in size from a few mm to over 10 cm in diameter. A fine pearly border can usually be seen on careful inspection. They occur most frequently on the trunk.
- 2C32.Y** **Other specified basal cell carcinoma of skin**
- 2C32.Z** **Basal cell carcinoma of skin, unspecified**

**2C33**

### **Adnexal carcinoma of skin**

A carcinoma arising from the sebaceous glands, sweat glands, or the hair follicles. Representative examples include sebaceous carcinoma, apocrine carcinoma, eccrine carcinoma, and pilomatrical carcinoma.

- Inclusions:**
- Primary cutaneous mucinous carcinoma
  - Primary cutaneous adenoid cystic carcinoma
  - Appendageal carcinoma of skin

**2C34**

### **Cutaneous neuroendocrine carcinoma**

Cutaneous neuroendocrine carcinoma is a primary cutaneous cancer arising from a subset of skin neuroendocrine cells (Merkel cells, giving the name Merkel cell carcinoma (MCC)).

**2C35**

### **Cutaneous sarcoma**

A group of generally rare malignant neoplasms arising from mesenchymal elements in the dermis including fibroblasts, pilar smooth muscle and vascular endothelium.

- Coded Elsewhere:**
- Angiosarcoma of skin (2B56.1)
  - Kaposi sarcoma of skin (2B57.1)
  - Cutaneous leiomyosarcoma (2B58.Y)
  - Dermatofibrosarcoma protuberans (2B53.Y)

### **Other specified malignant neoplasms of skin**

**2C3Z**

### **Malignant neoplasm of skin of unknown or unspecified type**

## **Malignant neoplasms of peripheral nerves or autonomic nervous system (2C40-2C4Z)**

- Exclusions:**
- Malignant nerve sheath tumour of peripheral nerves or autonomic nervous system, primary site (2B5E)
  - Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C40**

### **Malignant neuroepitheliomatous neoplasms of peripheral nerves or autonomic nervous system**

**2C41**

### **Malignant perineurioma**

**2C4Y**

### **Other specified malignant neoplasms of peripheral nerves and autonomic nervous system**

**2C4Z**

### **Malignant neoplasms of peripheral nerves or autonomic nervous system, unspecified**

## Malignant neoplasms of retroperitoneum, peritoneum or omentum (2C50-2C5Z)

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C50**

### **Malignant neoplasms of retroperitoneum**

A primary or metastatic malignant neoplasm involving the retroperitoneum. The vast majority of cases are carcinomas, lymphomas, or sarcomas.

**Exclusions:** Malignant neoplasms of omentum (2C52)

Malignant neoplasms of peritoneum (2C51)

Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C50.0 Cystic, mucinous or serous carcinoma of retroperitoneum**

**2C50.Y Other specified malignant neoplasms of retroperitoneum**

**2C50.Z Malignant neoplasms of retroperitoneum, unspecified**

**2C51**

### **Malignant neoplasms of peritoneum**

**Exclusions:** Malignant neoplasms of retroperitoneum (2C50)

Malignant neoplasms of omentum (2C52)

Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C51.0 Adenocarcinomas of peritoneum**

**2C51.1 Cystic, mucinous or serous carcinoma of peritoneum**

**2C51.2 Mesotheliomas of peritoneum**

A benign or malignant mesothelial neoplasm that arises from the peritoneum.

**2C51.20 Mesothelioma of mesocolon**

**2C51.21 Mesothelioma of mesentery**

**2C51.2Y Mesotheliomas of other specified sites of peritoneum**

**2C51.2Z Mesotheliomas of peritoneum, site unspecified**

### **Malignant neoplasms of breast (2C60-2C6Z)**

The category refers to primary malignant neoplasms of parenchyma, connective, and soft tissue of the breast, including nipple and areola.

<b><i>Inclusions:</i></b>	malignant neoplasm of connective tissue of breast
<b><i>Exclusions:</i></b>	Malignant neoplasm of skin of breast (2C30-2C3Z) Malignant mesenchymal neoplasms (2B50-2B5Z)
<b>2C60</b>	<b>Carcinoma of breast, specialised type</b>
<b>2C61</b>	<b>Invasive carcinoma of breast</b>
<b>2C61.0</b>	<b>Invasive ductal carcinoma of breast</b>
<b>2C61.1</b>	<b>Invasive lobular carcinoma of breast</b> An infiltrating lobular adenocarcinoma. The malignant cells lack cohesion and are arranged individually or in a linear manner (Indian files), or as narrow trabeculae within the stroma. The malignant cells are usually smaller than those of ductal carcinoma, are less pleomorphic, and have fewer mitotic figures.
<b>2C61.2</b>	<b>Invasive pleomorphic lobular carcinoma of breast</b> A grade II invasive lobular carcinoma of the breast, characterised by the presence of neoplastic cells with large and atypical nuclei.
<b>2C61.3</b>	<b>Invasive carcinoma of breast with mixed ductal and lobular features</b> An invasive ductal breast carcinoma associated with a lobular carcinomatous component. The lobular carcinomatous component may be in situ or invasive.

- 2C61.4 Invasive carcinoma of breast, unidentifiable type**  
A carcinoma that infiltrates the breast parenchyma and where the histopathological type could not be identified.
- 2C62 Inflammatory carcinoma of breast**  
An advanced, invasive breast adenocarcinoma characterised by the presence of distinct changes in the overlying skin. These changes include diffuse erythema, edema, peau d'orange (skin of an orange) appearance, tenderness, induration, warmth, enlargement, and in some cases a palpable mass. The skin changes are the consequence of lymphatic obstruction from the underlying invasive breast adenocarcinoma. Microscopically, the dermal lymphatics show prominent infiltration by malignant cells. The invasive breast adenocarcinoma is usually of ductal, NOS type. There is not significant inflammatory cell infiltrate present, despite the name of this carcinoma.
- 2C63 Malignant phyllodes tumour of breast**  
A phyllodes tumour of the breast characterised by infiltrative margins and a sarcomatous stromal component. The sarcomatous stroma usually displays features of fibrosarcoma. Liposarcomatous, osteosarcomatous, or rhabdomyosarcomatous elements may also be present.
- 2C64 Solid papillary carcinoma of breast with evidence of invasion**
- 2C65 Hereditary breast and ovarian cancer syndrome**
- 2C6Y Other specified malignant neoplasms of breast**
- 2C6Z Malignant neoplasms of breast, unspecified**

## Malignant neoplasms of female genital organs (2C70-2C7Z)

A primary or metastatic malignant neoplasm involving the female reproductive system. Representative examples include endometrial carcinoma, cervical carcinoma, ovarian carcinoma, uterine corpus leiomyosarcoma, adenosarcoma, malignant mixed mesodermal (mullerian) tumour, and gestational choriocarcinoma.

**Coding Note:** Includes Malignant neoplasm of skin of female genital organs

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C70**

### **Malignant neoplasms of vulva**

Squamous cell carcinoma of the vulva occurs predominantly in the older age group. Although the incidence rate of vulvar intraepithelial neoplasia is increasing, that of squamous cell carcinoma of the vulva is declining, reflecting earlier detection and more successful treatment. In addition to human papillomavirus infection, cigarette smoking is a putative risk factor for vulvar squamous cell carcinoma. There are three known precursor lesions: vulvar intraepithelial neoplasia, lichen sclerosus and chronic granulomatous disease. Other important epithelial malignancies of the vulva are Paget disease and Bartholin gland carcinoma. They are much less common than squamous lesions, and the risk factors are largely unknown. Prominent non-epithelial tumours are malignant melanoma and sarcoma botryoides.

**Coding Note:** Includes skin of vulva.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C70.0**

### **Basal cell carcinoma of vulva**

A slow growing, locally infiltrating carcinoma that arises from the vulva. It is characterised by the presence of malignant cells that resemble the basal cells that are present in the epidermis.

**2C70.1**

### **Melanoma of vulva**

**2C70.2**

### **Squamous cell carcinoma of vulva**

An invasive squamous cell carcinoma arising from the vulva. Risk factors include the human papilloma virus and cigarette smoking. Precursor lesions include the vulvar intraepithelial neoplasia, lichen sclerosus with associated squamous cell hyperplasia, and chronic granulomatous vulvar disease such as granuloma inguinale. Symptoms include vulvar pruritus or irritation, discharge, bleeding, and pain. The following morphologic variants have been identified: keratinizing, non-keratinizing, basaloid, warty, verrucous, keratoacanthoma-like, and squamous cell carcinoma with tumour giant cells. Risk factors for recurrence include advanced stage, tumour diameter greater than 2.5 cm, multifocality, capillary-like space involvement, associated vulvar intraepithelial neoplasia grades 2 or 3, and margins of resection involved by tumour.

**Coded Elsewhere:** Verrucous squamous cell carcinoma of vulva (2C31.0)

**2C70.Y**

### **Other specified malignant neoplasms of vulva**

**Coding Note:** Includes skin of vulva.

**2C70.Z**

### **Malignant neoplasms of vulva, unspecified**

**Coding Note:** Includes skin of vulva.

**2C71****Malignant neoplasms of vagina**

A primary or metastatic malignant tumour involving the vagina. Representative examples include carcinomas and sarcomas.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C71.0****Adenocarcinoma of vagina**

An adenocarcinoma arising from the vagina. Morphologic variants include the clear cell, endometrioid, mesonephric, and mucinous adenocarcinoma.

**2C71.1****Melanoma of vagina**

A primary malignant neoplasm of the vagina composed of malignant melanocytes.

**2C71.2****Squamous cell carcinoma of vagina**

A squamous cell carcinoma arising from the vagina. Human papillomavirus infection is associated with the development of vaginal intraepithelial neoplasia and invasive squamous cell carcinoma. Signs and symptoms include painless bleeding, postcoital bleeding, and urinary tract symptoms. Morphologically it resembles squamous cell carcinomas in other anatomic sites.

**2C71.Y****Other specified malignant neoplasms of vagina****2C71.Z****Malignant neoplasms of vagina, unspecified****2C72****Malignant neoplasms of uterine ligament, parametrium, or uterine adnexa**

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C72.0****Adenocarcinoma of uterine ligament, parametrium, or uterine adnexa****2C72.1****Mucinous or serous carcinoma of uterine ligament, parametrium, or uterine adnexa****2C72.3****Carcinosarcomas of uterine ligament, parametrium, or uterine adnexa****2C72.Y****Other specified malignant neoplasms of uterine ligament, parametrium, and uterine adnexa****2C72.Z****Malignant neoplasms of uterine ligament, parametrium, or uterine adnexa, unspecified****2C73****Malignant neoplasms of ovary**

A primary or metastatic malignant neoplasm involving the ovary. Most primary malignant ovarian neoplasms are either carcinomas (serous, mucinous, or endometrioid adenocarcinomas) or malignant germ cell tumours. Metastatic malignant neoplasms to the ovary include carcinomas, lymphomas, and melanomas.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**Coded Elsewhere:** Hereditary breast and ovarian cancer syndrome (2C65)

**2C73.0****Carcinomas of ovary**

- 2C73.00** Clear cell adenocarcinoma of ovary  
A malignant glandular epithelial tumour characterised by the presence of clear and hobnail cells. The tumour is highly associated with ovarian endometriosis, pelvic endometriosis and paraendocrine hypercalcemia.
- 2C73.01** Endometrioid adenocarcinoma of ovary  
An endometrioid adenocarcinoma arising from the ovary. It comprises 10% to 25% of all primary ovarian carcinomas. Grossly, endometrioid carcinoma may present as a cystic or solid mass. Microscopically, the tumour greatly resembles the appearance of the ordinary type of endometrial adenocarcinoma. As a group, endometrioid carcinoma has a prognosis twice as good as that of serous or mucinous carcinoma.
- 2C73.02** Low grade serous adenocarcinoma of ovary  
A slow-growing serous adenocarcinoma that arises from the ovary. It usually originates from borderline neoplastic processes or adenofibromas. It is characterised by the presence of low grade cytologic features and infrequent mitotic figures.
- 2C73.03** High grade serous adenocarcinoma of ovary
- 2C73.04** Mucinous adenocarcinoma of ovary  
An invasive adenocarcinoma that arises from the ovary and is characterised by the presence of malignant epithelial cells that contain intracytoplasmic mucin. There is cellular atypia, increased layering of cells, complexity of glands, and papillary formations.
- 2C73.0Y** Other specified carcinomas of ovary
- 2C73.0Z** Carcinomas of ovary, unspecified
- 2C73.1** **Dysgerminoma of ovary**  
A malignant germ cell tumour arising from the ovary. Morphologically, it is identical to seminoma and consists of a monotonous population of germ cells with abundant pale cytoplasm and uniform nuclei. The stroma invariably contains chronic inflammatory cells, mostly T-lymphocytes. It responds to chemotherapy or radiotherapy and the prognosis relates to the tumour stage.  
**Inclusions:** Malignant dysgerminomatous germ cell tumour of ovary
- 2C73.2** **Granulosa cell malignant tumour of ovary**  
An aggressive granulosa cell tumour that arises from the ovary and metastasizes to other anatomic sites.

- 2C73.3 Malignant teratoma of ovary**  
A malignant germ cell tumour arising from the ovary. It usually affects females in their first two decades of life. It contains variable amounts of immature embryonal tissues. Based on the amount of immature neuroepithelial component, immature teratomas are graded from 1 to 3. The stage and grade of the tumour and the grade of the metastatic tumour are the important factors that predict prognosis. The use of cisplatin-based combination chemotherapy has significantly improved the survival rates of the patients.
- Coded Elsewhere:** Struma ovarii (5A02.Y)
- 2C73.4 Serous cystadenoma, borderline malignancy of ovary**
- 2C73.5 Endodermal sinus tumour, unspecified site, female**
- 2C73.Y Other specified malignant neoplasms of the ovary**
- 2C73.Z Malignant neoplasms of ovary, unspecified**
- 2C74 Malignant neoplasms of fallopian tube**  
Tumours of the fallopian tube are much less common than the corresponding ovarian neoplasms; however, histologically the same surface epithelial-stromal tumour subtypes are recognised. Sex cord-stromal and germ cell tumours are rare. Hydatidiform moles and gestational choriocarcinoma are uncommon complications of tubal ectopic pregnancy. The wolffian adnexal tumour is also infrequent and typically occurs in the leaves of the broad ligament. The risk factors appear similar to those of the ovary. Fallopian tube carcinomas are a component of the hereditary breast-ovarian cancer syndrome caused by BRCA1 and BRCA2 germline mutations.
- Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)
- 2C74.0 Adenocarcinoma of fallopian tube**  
An adenocarcinoma that arises from the fallopian tube. Histologic subtypes include clear cell, endometrioid, serous, and mucinous adenocarcinoma. It spreads to adjacent organs, regional lymph nodes, and peritoneum.
- 2C74.Y Other specified malignant neoplasms of fallopian tube**
- 2C74.Z Malignant neoplasms of fallopian tube, unspecified**
- 2C75 Malignant neoplasms of placenta**  
**Exclusions:** hydatidiform mole, NOS (JA02)  
Malignant mesenchymal neoplasms (2B50-2B5Z)
- 2C75.0 Malignant trophoblastic neoplasms of placenta**  
A diverse group of pregnancy-related tumours characterised by excessive proliferation of trophoblasts. Representative examples include hydatidiform mole, gestational choriocarcinoma, and placental site trophoblastic tumour.
- 2C75.Y Other specified malignant neoplasms of placenta**
- 2C75.Z Malignant neoplasms of placenta, unspecified**

**2C76****Malignant neoplasms of corpus uteri**

A malignant neoplasm that affects the uterine corpus. Representative examples include endometrial carcinoma, carcinosarcoma, leiomyosarcoma, and adenosarcoma.

**Exclusions:** Endometrial stromal sarcoma, primary site (2B5C)

**2C76.0****Endometrial endometrioid adenocarcinoma****2C76.1****Endometrial mucinous adenocarcinoma****2C76.2****Endometrial clear cell adenocarcinoma****2C76.3****Endometrial serous adenocarcinoma****2C76.4****Endometrial mixed adenocarcinoma****2C76.40**

**2C76.43**

Carcinosarcoma of uterus

**2C76.4Z**

Endometrial mixed adenocarcinoma, unspecified

**2C76.Y****Other specified malignant neoplasms of corpus uteri****2C76.Z****Malignant neoplasms of corpus uteri, unspecified****2C77****Malignant neoplasms of cervix uteri**

Primary or metastatic malignant neoplasm involving the cervix.

**2C77.0****Squamous cell carcinoma of cervix uteri**

A squamous cell carcinoma arising from the cervical epithelium. It usually evolves from a precancerous cervical lesion. Increased numbers of sexual partners and human papillomavirus (HPV) infection are risk factors for cervical squamous cell carcinoma. The following histologic patterns have been described: Conventional squamous cell carcinoma, papillary squamous cell carcinoma, transitional cell carcinoma, lymphoepithelioma-like carcinoma, verrucous carcinoma, condylomatous carcinoma and spindle cell carcinoma. Survival is most closely related to the stage of disease at the time of diagnosis.

**2C77.1****Adenocarcinoma of cervix uteri**

An adenocarcinoma arising from the cervical epithelium. It accounts for approximately 15% of invasive cervical carcinomas. Increased numbers of sexual partners and human papillomavirus (HPV) infection are risk factors. Grossly, advanced cervical adenocarcinoma may present as an exophytic mass, an ulcerated lesion, or diffuse cervical enlargement. Microscopically, the majority of cervical adenocarcinomas are of the endocervical (mucinous) type.

**2C77.2****Adenosquamous carcinoma of cervix uteri****2C77.3****Neuroendocrine carcinoma of cervix uteri**

<b>Coding Note:</b>	Includes Malignant neoplasm of skin of female genital organs

### Malignant neoplasms of male genital organs (2C80-2C8Z)

A primary or metastatic malignant neoplasm involving the male reproductive system. Representative examples include prostate carcinoma, penile carcinoma, testicular seminoma, and testicular embryonal carcinoma.

<b>2C80</b>	<b>Malignant neoplasms of testis</b>
	A primary or metastatic malignant neoplasm that affects the testis. Representative examples include seminoma, embryonal carcinoma, sarcoma, leukaemia, and lymphoma.
	<b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z)
<b>2C80.2</b>	<b>Germ cell tumour of testis</b>
	A germ cell tumour arising from the testis. Representative examples include teratoma, seminoma, embryonal carcinoma, and yolk sac tumour.
<b>2C80.Y</b>	<b>Other specified malignant neoplasms of testis</b>
<b>2C80.Z</b>	<b>Malignant neoplasms of testis, unspecified</b>
<b>2C81</b>	<b>Malignant neoplasms of penis</b>
	A primary or metastatic malignant neoplasm that affects the penis. Representative examples include penile carcinoma and penile sarcoma.
	<b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z)
	<b>Coded Elsewhere:</b> Verrucous squamous cell carcinoma of penis (2C31.0)

- 2C81.0** **Squamous cell carcinoma of penis**  
A squamous cell carcinoma arising from the penis. It occurs chiefly in the squamous epithelium of the glans, coronal sulcus, and foreskin. Etiologic factors include phimosis, lichen sclerosus, smoking, ultraviolet irradiation, history of warts or condylomas, and lack of circumcision. Human papilloma virus is present in a subset of penile squamous cell carcinomas. Patients may present with an exophytic or flat ulcerative mass in the glans or a large primary tumour with inguinal nodal and skin metastases. Morphologic variants include the basaloid carcinoma, warty (condylomatous) carcinoma, verrucous carcinoma, and sarcomatoid (spindle cell) carcinoma.
- Coded Elsewhere:** Verrucous squamous cell carcinoma of penis (2C31.0)
- 2C81.1** **Melanoma of penis**
- Inclusions:** Melanoma of skin of penis  
Melanoma of mucocutaneous epithelium of penis
- 2C81.Y** **Other specified malignant neoplasm of penis**
- 2C81.Z** **Malignant neoplasms of penis, unspecified**
- 2C82** **Malignant neoplasms of prostate**  
Prostate cancer contributes significantly to the overall cancer burden, being the most frequent malignant neoplasia in men. The number of cases has continuously increased over the past decades, partly due to the higher life expectancy. An additional factor is the Western lifestyle, characterised by a highly caloric diet and lack of physical exercise. Epidemiological data indicates that black people are most susceptible, followed by white people, while Asian people have the lowest risk. The extent to which prostate cancer mortality can be reduced by PSA screening is currently being evaluated. Histopathological diagnosis and grading play a major role in the management of prostate cancer.
- Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)
- 2C82.0** **Adenocarcinoma of prostate**  
An adenocarcinoma arising from the prostate gland. It is one of the most common malignant tumours afflicting men. The majority of adenocarcinomas arise in the peripheral zone and a minority occurs in the central or the transitional zone of the prostate gland. Grading of prostatic adenocarcinoma predicts disease progression and correlates with survival. Several grading systems have been proposed, of which the Gleason system is the most commonly used. Gleason sums of 2 to 4 represent well-differentiated disease, 5 to 7 moderately differentiated disease and 8 to 10 poorly differentiated disease. Prostatic-specific antigen (PSA) serum test is widely used as a screening test for the early detection of prostatic adenocarcinoma.
- 2C82.Y** **Other specified malignant neoplasms of prostate**
- 2C82.Z** **Malignant neoplasms of prostate, unspecified**
- 2C83** **Malignant neoplasms of scrotum**
- Inclusions:** malignant neoplasm of skin of scrotum

<b>2C8Z</b>	<b>Malignant neoplasms of male genital organs, unspecified</b>

**Coding Note:** Includes malignant neoplasm of skin of male genital organs

### Malignant neoplasms of urinary tract (2C90-2C9Z)

A primary or metastatic malignant tumour involving the urinary system. Common tumour types include carcinomas, lymphomas, and sarcomas.

***Exclusions:*** Malignant mesenchymal neoplasms (2B50-2B5Z)

#### **2C90 Malignant neoplasms of kidney, except renal pelvis**

Cancer of the kidney amounts to 2% of the total human cancer burden, with approximately 190,000 new cases diagnosed each year. They occur in all world regions, with a preference for developed countries. Etiological factors include environmental carcinogens (tobacco smoking) and lifestyle factors, in particular obesity. Although renal tumours can be completely removed surgically, haematogeneous metastasis is frequent and may occur already at an early stage of the disease. The pattern of somatic mutations in kidney tumours has been extensively investigated and has become, in addition to histopathology, a major criterion for classification. Kidney tumours also occur in the setting of several inherited cancer syndromes, including von Hippel-Lindau disease.

***Exclusions:*** Malignant neoplasm of renal calyces (2C91)

Malignant neoplasms of renal pelvis (2C91)

Malignant mesenchymal neoplasms (2B50-2B5Z)

#### **2C90.0 Renal cell carcinoma of kidney, except renal pelvis**

A carcinoma arising from the renal parenchyma. The incidence of renal cell carcinoma has increased by 35% from 1973 to 1991. There is a strong correlation between cigarette smoking and the development of renal cell carcinoma. The clinical presentation includes: haematuria, flank pain and a palpable lumbar mass. A high percentage of renal cell carcinomas are diagnosed when an ultrasound is performed for other purposes. Diagnostic procedures include: ultrasound, intravenous pyelography and computed tomography (CT).

#### **2C90.Y Other specified malignant neoplasms of kidney, except renal pelvis**

#### **2C90.Z Malignant neoplasms of kidney, except renal pelvis, unspecified**

<b>2C91</b>	<b>Malignant neoplasms of renal pelvis</b> Abnormal malignant growth of the cells within the renal pelvis.  <b>Inclusions:</b> malignant neoplasm of pelviureteric junction malignant neoplasm of renal calyces  <b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z)
<b>2C91.0</b>	<b>Urothelial carcinoma of renal pelvis</b>

<b>2C93.0</b>	<b>Adenocarcinoma of urethra or paraurethral gland</b>
<b>2C93.1</b>	<b>Squamous cell carcinoma of urethra or paraurethral gland</b>
<b>2C93.2</b>	<b>Urothelial carcinoma of urethra or paraurethral gland</b>
<b>2C93.Y</b>	<b>Other specified malignant neoplasms of urethra and paraurethral gland</b>
<b>2C93.Z</b>	<b>Malignant neoplasms of urethra or paraurethral gland, unspecified</b>
<b>2C94</b>	<b>Malignant neoplasms of bladder</b> A primary or metastatic malignant neoplasm involving the bladder.  <b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z)
<b>2C94.0</b>	<b>Adenocarcinoma of urinary bladder</b> A rare adenocarcinoma arising from metaplastic bladder epithelium. It is frequently associated with long-standing local irritation. The majority of cases originate from the trigone and the posterior wall of the bladder.

<b>2C94.1</b>	<b>Squamous cell carcinoma of urinary bladder</b> A squamous cell carcinoma of the bladder arising from metaplastic epithelium. It represents less than 10% of bladder carcinomas. The exception is the Middle East along the Nile Valley, where it represents the most common form of carcinoma because of the endemic nature of schistosomiasis. Bladder squamous cell carcinoma is often associated with long-standing chronic inflammation of the bladder and usually has a poor prognosis. The diagnosis of squamous cell carcinoma of the bladder should be reserved for those tumours that are predominantly keratin forming.
<b>2C94.2</b>	<b>Urothelial carcinoma of bladder</b>
<b>2C94.Y</b>	<b>Other specified malignant neoplasms of bladder</b>
<b>2C94.Z</b>	<b>Malignant neoplasms of bladder, unspecified</b>
<b>2C95</b>	<b>Malignant neoplasm involving overlapping sites of urinary organs</b> Malignant neoplasm of urinary organs whose point of origin cannot be classified to any other existing category  <b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z)
<b>2C95.0</b>	<b>Adenocarcinoma involving overlapping sites of urinary organs</b>

### Malignant neoplasms of eye or ocular adnexa (2D00-2D0Z)

A malignant neoplasm affecting the structures of the eye.

<b>Exclusions:</b>	Malignant neoplasm of optic nerve (2A02) Malignant neoplasm of skin of eyelid (2C30-2C3Z) Malignant mesenchymal neoplasms (2B50-2B5Z)
--------------------	---

**Coded Elsewhere:** Melanoma of uvea (2D0Y)

<b>2D00</b>	<b>Malignant neoplasm of conjunctiva</b> A malignant growth of cells within the conjunctiva of the eye.  <b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z)
-------------	--

- 2D00.0** **Melanoma of conjunctiva**  
A malignant melanoma within the conjunctiva of the eye.
- 2D00.1** **Malignant neoplasm of caruncle**  
This is a broad group of diseases involving unregulated cell growth of a small, red portion of the corner of the eye that contains modified sebaceous and sweat glands.
- 2D00.2** **Squamous cell carcinoma of conjunctiva**
- 2D00.Y** **Other specified malignant neoplasm of conjunctiva**
- 2D00.Z** **Malignant neoplasm of conjunctiva, unspecified**
- 2D01** **Malignant neoplasm of cornea**  
A malignant growth of cells within the cornea of the eye.  
**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)
- 2D01.0** **Melanoma of cornea**  
A melanoma within the cornea of the eye.
- 2D01.1** **Squamous cell carcinoma of cornea**
- 2D01.Y** **Other specified malignant neoplasms of cornea**
- 2D01.Z** **Malignant neoplasm of cornea, unspecified**
- 2D02** **Malignant neoplasm of retina**  
Abnormal growth of cells comprising the retina with malignant characteristics.  
**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)
- 2D02.0** **Adenocarcinoma of retinal pigment epithelium**  
This is a cancer of an epithelium that originates in glandular tissue. Epithelial tissue includes, but is not limited to, the surface layer of skin, glands, and a variety of other tissue that lines the cavities and organs of the body. This diagnosis is with the pigmented cell layer just outside the neurosensory retina that nourishes retinal visual cells, and is firmly attached to the underlying choroid and overlying retinal visual cells.
- 2D02.1** **Malignant neuroepithelial tumours of retina**
- 2D02.2** **Retinoblastoma**  
Retinoblastoma is the most common intraocular malignancy in children. It is a life threatening condition but is potentially curable. It can be hereditary or non-hereditary, unilateral or bilateral (unilateral retinoblastoma, bilateral retinoblastoma, see these terms).
- 2D02.Y** **Other specified malignant neoplasm of retina**
- 2D02.Z** **Malignant neoplasm of retina, unspecified**

<b>2D03</b>	<b>Malignant neoplasm of lacrimal apparatus</b>
	<b><i>Exclusions:</i></b> Malignant mesenchymal neoplasms (2B50-2B5Z)

<b>2D06.Y</b>	<b>Other specified malignant neoplasm of ciliary body</b>
<b>2D06.Z</b>	<b>Malignant neoplasm of ciliary body, unspecified</b>
<b>2D07</b>	<b>Malignant neoplasm of iris</b>
<b>2D07.0</b>	<b>Adenocarcinoma of iris epithelium</b>
<b>2D07.1</b>	<b>Malignant neuroepithelial tumours of iris</b>
<b>2D07.2</b>	<b>Melanoma of iris</b>
<b>2D07.Y</b>	<b>Other specified malignant neoplasm of iris</b>
<b>2D07.Z</b>	<b>Malignant neoplasm of iris, unspecified</b>
<b>2D0Y</b>	<b>Other specified malignant neoplasms of eye and ocular adnexa</b>

**2D0Z**

**Malignant neoplasms of eye or ocular adnexa, unspecified**

**Malignant neoplasms of endocrine glands (2D10-2D1Z)**

A malignant neoplasm affecting the endocrine glands. Representative examples include thyroid gland carcinoma, parathyroid gland carcinoma, pituitary gland carcinoma, and adrenal cortex carcinoma.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2D10**

**Malignant neoplasms of thyroid gland**

A primary or metastatic malignant neoplasm affecting the thyroid gland.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**Coded Elsewhere:** Thyroid lymphoma (2B33.5)

**2D10.0**

**Follicular carcinoma of thyroid gland**

A differentiated adenocarcinoma arising from the follicular cells of the thyroid gland. The nuclear features which characterise the thyroid gland papillary carcinoma are absent. Radiation exposure is a risk factor and it comprises approximately 10% to 15% of thyroid cancers. Clinically, it usually presents as a solitary mass in the thyroid gland. It is generally unifocal and thickly encapsulated and shows invasion of the capsule or the vessels. Diagnostic procedures include: thyroid ultrasound and fine needle biopsy.

**2D10.1**

**Papillary carcinoma of thyroid gland**

A differentiated adenocarcinoma arising from the follicular cells of the thyroid gland. Radiation exposure is a risk factor and it is the most common malignant thyroid lesion, comprising 75% to 80% of all thyroid cancers in iodine sufficient countries. Diagnostic procedures include: thyroid ultrasound, and fine needle biopsy. Microscopically, the diagnosis is based on the distinct characteristics of the malignant cells, which include enlargement, oval shape, elongation, and overlapping of the nuclei. The nuclei also display clearing or have a ground glass appearance.

**2D10.2**

**Poorly differentiated carcinoma of thyroid gland**

**2D10.3**

**Undifferentiated carcinoma of thyroid gland**

A primary carcinoma of the thyroid gland composed of undifferentiated cells. The malignant cells demonstrate evidence of epithelial differentiation, either by immunohistochemistry or electron microscopic studies. Microscopically, in the majority of cases there is a mixture of spindle, epithelioid, and giant cells. The vast majority of the patients present with a rapidly enlarging neck mass. The clinical course is invariably aggressive.

**Inclusions:** anaplastic carcinoma of thyroid gland

- 2D10.4 Medullary carcinoma of thyroid gland**  
A neuroendocrine carcinoma arising from the C-cells of the thyroid gland. It is closely associated with multiple endocrine neoplasia syndromes. Approximately 10% to 20% of medullary thyroid carcinomas are familial. Patients usually present with a thyroid nodule that is painless and firm. In the majority of cases nodal involvement is present at diagnosis.
- 2D10.Y Other specified malignant neoplasms of thyroid gland**
- 2D10.Z Malignant neoplasms of thyroid gland, unspecified**
- 2D11 Malignant neoplasms of adrenal gland**  
Tumours arising from the adrenal cortex include adenomas and carcinomas. These are rare neoplasms but may cause a variety of hormonal symptoms, including hyperaldosteronism, Cushing syndrome, and virilisation. A small fraction of adrenocortical tumours are associated with an inherited tumour syndrome, including Li-Fraumeni syndrome and Carney complex.  
Benign and malignant phaeochromocytomas arise in the adrenal medulla and are derived from chromaffin cells of neural crest origin. Phaeochromocytomas may occur in the setting of several hereditary conditions, including multiple endocrine neoplasia types 2a and 2b, von Hippel Lindau disease and neurofibromatosis.  
Extra adrenal paragangliomas arise from chromaffin cells in sympathoadrenal and parasympathetic paraganglia. They occur in many parts of the body and can pose a significant challenge to surgeons and oncologists. Some function as chemoreceptors, others are endocrinologically active. Familial paragangliomas are associated with mutations of the mitochondrial complex II genes.  
**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)
- 2D11.0 Adenocarcinoma of adrenal gland**
- 2D11.1 Malignant phaeochromocytoma of adrenal gland**
- 2D11.2 Neuroblastoma of adrenal gland**  
Neuroblastomas are malignant tumours that form in certain types of the nerve tissue. It most often begins in the adrenal gland. About 1 out of 3 neuroblastomas start in the adrenal glands and about 1 out of 4 begin in sympathetic nerve ganglia in the abdomen. Most of the rest start in sympathetic ganglia near the spine in the chest or neck, or in the pelvis.
- 2D11.Y Other specified malignant neoplasms of adrenal gland**
- 2D11.Z Malignant neoplasms of adrenal gland, unspecified**

**2D12 Malignant neoplasms of other endocrine glands or related structures**

**Exclusions:** Malignant neoplasms of adrenal gland (2D11)

Malignant neoplasms of testis (2C80)

Malignant neoplasms of ovary (2C73)

Malignant neoplasm of pancreas (2C10)

Malignant neoplasms of thyroid gland (2D10)

Malignant neoplasms of thymus (2C27)

Malignant mesenchymal neoplasms (2B50-2B5Z)

**2D12.0 Malignant epithelial neoplasms of other endocrine glands or related structures, unspecified type**

**2D12.1 Adenocarcinoma of other endocrine glands or related structures**

**2D12.Y Other specified malignant neoplasms of other endocrine glands or related structures**

**2D12.Z Malignant neoplasms of other endocrine glands or related structures, unspecified**

**2D1Z Malignant neoplasms of endocrine glands, unspecified**

---

**2D3Y Other specified malignant neoplasms, stated or presumed to be primary, of specified sites, except of lymphoid, haematopoietic, central nervous system or related tissues**

**2D3Z Malignant neoplasms, stated or presumed to be primary, of specified sites, except of lymphoid, haematopoietic, central nervous system or related tissues, unspecified**

Malignant neoplasms of ill-defined or unspecified primary sites (2D40-2D4Z)

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2D40 Adenocarcinoma of unspecified site**

A common cancer characterised by the presence of malignant glandular cells. Morphologically, adenocarcinomas are classified according to the growth pattern (e.g., papillary, alveolar) or according to the secreting product (e.g., mucinous, serous). Representative examples of adenocarcinoma are ductal and lobular breast carcinoma, lung adenocarcinoma, renal cell carcinoma, hepatocellular carcinoma (hepatoma), colon adenocarcinoma, and prostate adenocarcinoma.

**2D41 Unspecified carcinoma of unspecified site**

**2D42 Malignant neoplasms of ill-defined sites**

Malignant neoplasms of ill defined sites is used for cases where the documentation refers to a site that includes multiple organ systems and tissue types that should be coded separately.

<b>2D43</b>	<b>Malignant neoplasms of independent, multiple primary sites</b>
<b>Coding Note:</b>	Use additional codes to identify individual neoplasms.
<b>2D44</b>	<b>Malignant neoplasm, primary site unknown, so stated</b>
<b>2D4Y</b>	<b>Other specified malignant neoplasms of unspecified primary sites</b>
<b>2D4Z</b>	<b>Unspecified malignant neoplasms of unspecified sites</b>

Malignant neoplasm metastases (2D50-2E2Z)

Spread of a malignant neoplasm into secondary sites.

<b>2D50</b>	<b>Malignant neoplasm metastasis in brain</b>
	A malignant neoplasm that has spread to the brain from another anatomic site or system. The majority are carcinomas (usually lung or breast carcinomas).
<b>2D51</b>	<b>Malignant neoplasm metastasis in meninges</b>
<b>2D52</b>	<b>Malignant neoplasm metastasis in spinal cord, cranial nerves or remaining parts of central nervous system</b>

Malignant neoplasm metastasis in lymph nodes (2D60-2D6Z)

**Exclusions:** Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

<b>2D60</b>	<b>Malignant neoplasm metastasis in lymph node of a single region</b>
<b>2D60.0</b>	<b>Malignant neoplasm metastasis in lymph nodes of head, face or neck</b>
<b>2D60.1</b>	<b>Malignant neoplasm metastasis in intrathoracic lymph nodes</b>
<b>2D60.2</b>	<b>Malignant neoplasm metastasis in intra-abdominal lymph nodes</b>
<b>2D60.3</b>	<b>Malignant neoplasm metastasis in axillary lymph nodes</b>
<b>2D60.4</b>	<b>Malignant neoplasm metastasis in inguinal lymph nodes</b>
<b>2D60.5</b>	<b>Malignant neoplasm metastasis in intrapelvic lymph nodes</b>
<b>2D60.Y</b>	<b>Other specified malignant neoplasm metastasis in lymph node of a single region</b>
<b>2D60.Z</b>	<b>Malignant neoplasm metastasis in lymph node of a single region, unspecified</b>
<b>2D61</b>	<b>Malignant neoplasm metastases in lymph nodes of multiple regions</b>
<b>2D6Z</b>	<b>Metastatic malignant neoplasm to unspecified lymph node</b>

## Malignant neoplasm metastasis in thoracic or respiratory organs (2D70-2D7Z)

**2D70**

### **Malignant neoplasm metastasis in lung**

**Exclusions:** Malignant neoplasms of bronchus or lung (2C25)

**2D71**

### **Malignant neoplasm metastasis in mediastinum**

The spread of cancer to the mediastinum from an adjacent or distant anatomic site.

**2D72**

### **Malignant neoplasm metastasis in pleura**

The spread of cancer to the pleura from an adjacent or distant anatomic site.

**2D73**

### **Malignant neoplasm metastasis in upper respiratory tract organs**

**2D7Y**

### **Malignant neoplasm metastasis in other specified thoracic organs**

**2D7Z**

### **Malignant neoplasm metastasis in thoracic or respiratory organs, unspecified**

## Malignant neoplasm metastasis in digestive system (2D80-2D8Z)

**2D80**

### **Malignant neoplasm metastasis in liver or intrahepatic bile duct**

Malignant neoplasms that have metastasized to the liver from extrahepatic primary tumours.

**2D80.0**

### **Malignant neoplasm metastasis in liver**

**2D80.1**

### **Malignant neoplasm metastasis in intrahepatic bile duct**

**2D81**

### **Malignant neoplasm metastasis in pancreas**

A malignant neoplasm that has spread to the pancreas from another anatomic site. Representative examples include metastatic carcinomas from the gastrointestinal tract, metastatic melanomas, and renal cell carcinomas.

**2D82**

### **Malignant neoplasm metastasis in extrahepatic bile ducts**

**2D83**

### **Malignant neoplasm metastasis in ampulla of Vater**

**2D84**

### **Malignant neoplasm metastasis in the small intestine**

The spread of cancer to the small intestine. This may be from a primary intestinal cancer, or from a cancer at a distant site.

**2D85**

### **Malignant neoplasm metastasis in large intestine**

The spread of cancer to the large intestine; this may be from a primary colon or rectal cancer to another location in the large intestine, or from a cancer at a distant site or organ.

**2D86**

### **Malignant neoplasm metastasis in anus**

Malignant tumour that metastasized in the anus and anal canal.

**2D8Y**

### **Malignant neoplasm metastasis in other specified digestive system organ**

**2D8Z**

**Malignant neoplasm metastasis in unspecified digestive system organ**

Malignant neoplasm metastasis in retroperitoneum or peritoneum (2D90-2D91)

**2D90**

**Malignant neoplasm metastasis in retroperitoneum**

**2D91**

**Malignant neoplasm metastasis in peritoneum**

Malignant neoplasm metastasis in other sites (2E00-2E0Y)

**2E00**

**Malignant neoplasm metastasis in kidney or renal pelvis**

The spread of the cancer to the kidney. This may be from a primary kidney cancer involving the opposite kidney, or from a cancer at a distant site.

**2E01**

**Malignant neoplasm metastasis in bladder**

Tumours of the urinary bladder that originate from an extravesical, non-urothelial tract neoplasm

**2E02**

**Malignant neoplasm metastasis in other or unspecified urinary system organs**

**2E03**

**Malignant neoplasm metastasis in bone or bone marrow**

The spread of a malignant neoplasm from a primary site to the skeletal system. The majority of metastatic neoplasms to the bone are carcinomas.

**2E04**

**Malignant neoplasm metastasis in soft tissue**

**2E05**

**Malignant neoplasm metastasis in female reproductive system**

**2E05.0**

**Malignant neoplasm metastasis in ovary**

The spread of the cancer to the ovary. This may be from a primary ovarian cancer involving the opposite ovary, or from a cancer at a distant site.

**2E05.Y**

**Malignant neoplasm metastasis in other female reproductive system organs**

**2E05.Z**

**Malignant neoplasm metastasis in female reproductive system, unspecified**

**2E06**

**Malignant neoplasm metastasis in male genital organs**

**2E07**

**Malignant neoplasm metastasis in adrenal gland**

A malignant tumour that has spread to the adrenal gland from an adjacent or distant anatomic site. The majority of cases are metastatic carcinomas, and less frequently lymphomas. (NCI05)

**2E08**

**Metastatic malignant neoplasm involving skin**

Involvement of the skin by metastatic spread from a known or unknown primary malignant neoplasm. The secondary deposit may result from local migration of malignant cells, or from regional lymphatic or haematogenous spread from more distant sites.

<b>2E09</b>	<b>Malignant neoplasm metastasis in peripheral nervous system</b>
<b>2E0Y</b>	<b>Malignant neoplasm metastasis in other specified sites</b>
<b>2E2Z</b>	<b>Malignant neoplasm metastasis, unspecified</b>

In situ neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues (2E60-2E6Z)

**2E60**      **Carcinoma in situ of oral cavity, oesophagus or stomach**

**Exclusions:**      Melanoma in situ neoplasms (2E63)

**2E60.0**      **Carcinoma in situ of lip, oral cavity or pharynx**

**Exclusions:**      Carcinoma in situ of aryepiglottic fold, laryngeal aspect (2E62.0)

                          Carcinoma in situ of epiglottis nos (2E62.0)

                          Carcinoma in situ of epiglottis, suprathyroid portion (2E62.0)

                          Carcinoma in situ of skin of lip (2E64)

**2E60.1**      **Carcinoma in situ of oesophagus**

Stage 0 includes: For squamous cell carcinoma: Tis (HGD), N0, M0, G1, GX, tumour location: Any. For adenocarcinoma: Tis (HGD), N0, M0, G1, GX. Tis: High-grade dysplasia. N0: No regional lymph node metastasis. M0: No distant metastasis. G1: Well differentiated. GX: Grade cannot be assessed-stage grouping as G1. tumour location: Location of the primary cancer site is defined by the position of the upper (proximal) edge of the tumour in the esophagus.

**Coded Elsewhere:** Oesophageal adenocarcinoma in situ (2E60.1)

**2E60.2**      **Carcinoma in situ of stomach**

Stage 0 includes: Tis, N0, M0. Tis: Carcinoma in situ: intraepithelial tumour without invasion of the lamina propria. N0: No regional lymph node metastasis. M0: No distant metastasis.

**2E61**      **Carcinoma in situ of other or unspecified digestive organs**

**Exclusions:**      Melanoma in situ neoplasms (2E63)

**2E61.0**      **Carcinoma in situ of colon**

Stage 0 includes: Tis, N0, M0. Tis: Carcinoma in situ: intraepithelial or invasion of lamina propria. N0: No regional lymph node metastasis. M0: No distant metastasis.

**2E61.1**      **Carcinoma in situ of rectum**

Malignant epithelial tumour of rectum that has not invaded adjacent tissue of the large intestine.

- 2E61.2** **Carcinoma in situ of anal canal**  
Malignant epithelial tumour that has not invaded beyond the epithelium of the anal canal.
- Exclusions:**      Carcinoma in situ of anal margin (2E64.2)  
                      Carcinoma in situ of anal skin (2E64)  
                      Carcinoma in situ of perianal skin (2E64.2)
- 2E61.3** **Carcinoma in situ of gallbladder, biliary tract or ampulla of Vater**  
an early form of cancer without invasion of tumour cells into the surrounding tissue, usually before penetration through the basement membrane.
- 2E61.Y** **Carcinoma in situ of other specified digestive organs**
- 2E61.Z** **Carcinoma in situ of unspecified digestive organs**
- 2E62** **Carcinoma in situ of middle ear or respiratory system**
- Exclusions:**      Melanoma in situ neoplasms (2E63)
- 2E62.0** **Carcinoma in situ of larynx**
- Exclusions:**      Carcinoma in situ of aryepiglottic fold, hypopharyngeal aspect (2E60.0)  
                      Carcinoma in situ of aryepiglottic fold, marginal zone (2E60.0)  
                      Carcinoma in situ of aryepiglottic fold, NOS (2E60.0)
- 2E62.1** **Carcinoma in situ of trachea**
- 2E62.2** **Carcinoma in situ of bronchus or lung**
- 2E62.Y** **Carcinoma in situ of other specified sites of middle ear and respiratory system**
- 2E62.Z** **Carcinoma in situ of unspecified sites of middle ear and respiratory system**
- 2E63** **Melanoma in situ neoplasms**  
Stage 0 includes: Tis, N0, M0. Tis: Melanoma in situ. N0: No regional lymph node metastases. M0: No detectable evidence of distant metastases.
- 2E63.0** **Melanoma in situ of skin**  
Malignant melanoma confined to the epidermis and described as being in radial growth phase.
- 2E63.00** **Lentigo maligna**  
An atypical proliferation of atypical melanocytes in the dermal-epidermal junction, without infiltration of the papillary or reticular dermis. The melanocytic proliferation is associated with actinic damage and epidermal atrophy. It usually occurs in the sun-exposed skin of elderly people. It is a form of melanoma in situ and in approximately 5% of cases it progresses to lentigo maligna melanoma.
- 2E63.0Z** **Melanoma in situ of skin, unspecified**
- 2E63.1** **Melanoma in situ of conjunctiva**

<b>2E63.Y</b>	<b>Melanoma in situ neoplasms, other specified site</b>
<b>2E63.Z</b>	<b>Melanoma in situ neoplasms, unspecified site</b>
<b>2E64</b>	<p><b>Carcinoma in situ of skin</b></p> <p>Stage 0 includes: Tis, N0, M0. Tis: Carcinoma in situ. N0: No regional lymph node metastasis. M0: No clinical or radiographic evidence of distant metastasis.</p> <p><b>Exclusions:</b> Melanoma in situ neoplasms (2E63)</p> <p><b>Coded Elsewhere:</b> Carcinoma in situ of vulva (2E67.1) Carcinoma in situ of penis (2E67.4)</p>
<b>2E64.0</b>	<p><b>Intraepidermal squamous cell carcinoma</b></p> <p>Malignant squamous neoplasia confined to the epidermis of extragenital skin and known commonly as Bowen disease. It arises most frequently on chronically sun-exposed glabrous skin of the head and neck or lower legs. It typically presents as single or multiple well-demarcated scaly erythematous patches, nodules or plaques which histologically show extensive keratinocytic atypia. It may develop from preexisting actinic keratosis (Actinic intraepidermal squamous cell carcinoma). Although it is most commonly associated with exposure to ultraviolet radiation, other carcinogens such as arsenic and tar may be implicated. Human papilloma virus may represent an additional risk factor in immunosuppressed patients.</p>
<b>2E64.00</b>	<p>Bowen disease of skin</p> <p>Intraepidermal squamous cell carcinoma due to predisposing factors including chronic human papilloma virus infection, arsenic ingestion, ionising radiation and chronic immunosuppression.</p>
<b>2E64.01</b>	<p>Actinic intraepidermal squamous cell carcinoma</p> <p>Intraepidermal squamous cell carcinoma attributable to chronic exposure to ultraviolet radiation and typically developing from a pre-existing actinic keratosis</p>
<b>2E64.0Y</b>	Other specified intraepidermal squamous cell carcinoma
<b>2E64.0Z</b>	Intraepidermal squamous cell carcinoma, unspecified
<b>2E64.1</b>	<p><b>Extramammary Paget disease of skin</b></p> <p>An intraepithelial adenocarcinoma of apocrine gland-bearing skin and mucous membrane. Clinically it presents as sharply demarcated erythematous plaques most commonly affecting the vulva in women and perianal skin in men.</p> <p><b>Coded Elsewhere:</b> Vulvar Paget disease (2E67.11)</p>
<b>2E64.2</b>	<p><b>Carcinoma in situ of anal margin or perianal skin</b></p> <p>Carcinoma in situ of anal margin or perianal skin is most commonly squamous and related to oncogenic HPV strains, HIV infection or both. It may present as warty pigmented patches (Bowenoid papulosis).</p>
<b>2E64.Y</b>	<b>Other specified carcinoma in situ of skin</b>
<b>2E64.Z</b>	<b>Carcinoma in situ of skin, unspecified</b>

<b>2E65</b>	<b>Carcinoma in situ of breast</b>
	<b><i>Exclusions:</i></b> carcinoma in situ of skin of breast (2E64) melanoma in situ of breast (skin) (2E63)
<b>2E65.0</b>	<b>Lobular carcinoma in situ of breast</b>
<b>2E65.1</b>	<b>Lobular carcinoma in situ of breast, pleomorphic subtype</b>
<b>2E65.2</b>	<b>Ductal carcinoma in situ of breast</b>
	<b><i>Exclusions:</i></b> Atypical ductal hyperplasia of breast (2F75)
<b>2E65.3</b>	<b>Ductal carcinoma in situ of breast, comedo subtype</b>
<b>2E65.4</b>	<b>Mixed ductal and lobular carcinoma in situ of breast</b> The co-existence of ductal and lobular carcinoma in situ in the breast, without evidence of stromal invasion.
<b>2E65.5</b>	<b>Paget disease of nipple</b> Paget disease of the nipple describes a rare presentation of breast cancer, seen most frequently in women aged 50-60, manifesting with nipple drainage and itching, erythema, crusty, excoriated nipple, thickened plaques and hyperpigmentation (less frequently). It is due to tumour cells invading the nipple-areola complex and represents 1%-3% of all new breast cancer diagnoses.
<b>2E65.Y</b>	<b>Other specified carcinoma in situ of breast</b>
<b>2E65.Z</b>	<b>Carcinoma in situ of breast, unspecified</b>
<b>2E66</b>	<b>Carcinoma in situ of cervix uteri</b>
	<b><i>Exclusions:</i></b> melanoma in situ of cervix (2E63) Low grade squamous intraepithelial lesion of cervix uteri (GA15.7)
<b>2E66.2</b>	<b>High grade squamous intraepithelial lesion of cervix uteri</b>
<b>2E66.Y</b>	<b>Other specified carcinoma in situ of cervix uteri</b>
<b>2E66.Z</b>	<b>Carcinoma in situ of cervix uteri, unspecified</b>
<b>2E67</b>	<b>Carcinoma in situ of other or unspecified genital organs</b>
	<b><i>Exclusions:</i></b> Melanoma in situ neoplasms (2E63)
<b>2E67.0</b>	<b>Carcinoma in situ of endometrium</b>
<b>2E67.1</b>	<b>Carcinoma in situ of vulva</b>
	<b><i>Exclusions:</i></b> Low grade squamous intraepithelial lesion of vulva (GA13.1)

- 2E67.11** Vulvar Paget disease  
 An uncommon intraepithelial malignant neoplasm of eccrine or apocrine origin, arising from the vulva. It usually affects post-menopausal women. In approximately 10-20% of the cases there is an associated anorectal, or urothelial carcinoma or a skin appendage adenocarcinoma identified. It presents as a red, eczematous lesion. Microscopically, it is characterised by the presence of the typical Paget cells which are large, round cells with abundant cytoplasm and prominent nuclei.
- 2E67.12** Vulvar intraepithelial neoplasia, HPV-independent  
 Vulvar intraepithelial neoplasia (VIN), HPV-independent, is a non-invasive precursor of HPV-independent squamous cell carcinoma of the vulva, characterized by atypia of the basal and parabasal keratinocytes in an otherwise well-differentiated epithelium.
- Exclusions:** Low grade squamous intraepithelial lesion of vulva (GA13.1)
- 2E67.13** High grade squamous intraepithelial lesion of vulva, HPV-associated  
 Squamous intraepithelial lesions (SILs) of the vulva (also known as vulvar intraepithelial neoplasia [VIN]), HPV-associated, are proliferations of squamous cells driven by HPV infection, showing maturation abnormalities and nuclear hyperchromasia that do not extend beyond the basement membrane.
- Coded Elsewhere:** Bowenoid papulosis of the vulva (1A95.1)
- 2E67.2** **Carcinoma in situ of vagina**
- 2E67.22** High grade squamous intraepithelial lesion of vagina
- 2E67.2Y** Other specified carcinoma in situ of vagina
- 2E67.2Z** Carcinoma in situ of vagina, unspecified
- 2E67.3** **Carcinoma in situ of other or unspecified female genital organs**
- 2E67.4** **Carcinoma in situ of penis**  
 This comprises both squamous carcinoma in situ and extramammary Paget disease of the penis. The former is an uncommon precancerous disease of penile skin. Lesions usually appear on the glans or inner aspect of the foreskin and are almost always found in uncircumcised men. If left untreated, 10-30% of cases develop into invasive squamous cell carcinoma of the penis. When it affects the skin of the shaft or prepuce it is commonly called Bowen disease. If it affects the glans or inner surface of the prepuce it may also be referred to as penile intraepithelial neoplasia (or in the past as erythroplasia of Queyrat). Extramammary Paget disease of penis is a rare form of carcinoma in situ involving penile skin or glans penis.
- Coded Elsewhere:** Extramammary Paget disease of penis (2E64.1)
- 2E67.40** Squamous cell carcinoma in situ of skin of penis  
 Squamous cell carcinoma affecting the skin of the prepuce or of the shaft of the penis and commonly called Bowen disease. HPV infection and chronic exposure to psoralen photochemotherapy are predisposing factors.
- Inclusions:** Bowen disease of skin of penis

<b>2E67.41</b>	Squamous cell carcinoma in situ of mucocutaneous epithelium of penis
	<b>Inclusions:</b> Penile intraepithelial neoplasia of inner preputial epithelium Penile intraepithelial neoplasia of glans penis
<b>2E67.5</b>	<b>High grade intraepithelial lesion of prostate</b> High grade prostatic intraepithelial neoplasia characterised by the presence of severe architectural and cytologic abnormalities.
	<b>Inclusions:</b> high grade prostatic intraepithelial neoplasia <b>Exclusions:</b> low grade dysplasia of prostate (GA91.6)

<b>2E6Z</b>	<b>Carcinoma in situ of unspecified site</b>

Benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues (2E80-2F5Z)

A neoplasm which is characterised by the absence of morphologic features associated with malignancy (severe cytologic atypia, tumour cell necrosis, and high mitotic rate). Benign neoplasms remain confined to the original site of growth and only rarely metastasize to other anatomic sites.

Benign mesenchymal neoplasms (2E80-2E8Z)

Benign neoplasms of muscle, fat, fibrous tissue, bone, cartilage, and blood vessels.

<b>2E80</b>	<b>Benign lipomatous neoplasm</b> A benign tumour composed of adipose (fatty) tissue. The most common representative of this category is the lipoma.

- 2E81.1** **Benign lymphatic neoplasms**  
 Benign circumscribed or diffuse neoplasms of lymphatic vessels. They are much less common than lymphatic malformations and are distinguished from the latter by proliferative growth and the potential to become widely disseminated.
- Exclusions:** Lymphatic malformations (LA90.1)
- 2E81.10** Disseminated lymphangiomatosis  
 A rare disorder characterised by widespread proliferation of aberrant lymphatic vessels which typically infiltrate vital organs in the thorax and abdomen.
- 2E81.11** Acquired progressive lymphangioma  
 Acquired progressive lymphangioma is a benign localised but slowly progressive tumour of lymphatic vessels that typically presents as reddish or bruise-like plaques on the abdominal wall, thigh or calf of young adolescents.
- Exclusions:** Lymphatic malformations (LA90.1)
- 2E81.1Y** Other specified benign lymphatic neoplasms
- 2E81.1Z** Benign lymphatic neoplasms, unspecified
- 2E81.2** **Benign vascular neoplasms of infancy and childhood**  
 The commonest benign vascular neoplasm of infancy is infantile haemangioma. Less common neoplasms are congenital haemangioma, spindle cell haemangioma, tufted angioma and kaposiform haemangioendothelioma.
- 2E81.20** Focal infantile haemangioma  
 Infantile haemangioma is a common benign vascular neoplasm which develops in about 4% of infants. It appears within weeks of birth as a blanched, blushed, or telangiectatic area that then rapidly proliferates for several months before entering a prolonged process of involution lasting up to 12 years, leaving a residual variably prominent scar. A solitary focal tumour is seen in about 85% of cases. Over half of cases are located on the head and neck. Complications include bleeding, infection, ulceration and, in tumours situated close to the eye, amblyopia.
- Inclusions:** Strawberry naevus
- 2E81.21** Multifocal infantile haemangioma  
 Infantile haemangioma is multifocal in up to 25% of cases with numbers ranging from a few to many dozens. If more than 5 cutaneous tumours are present there is an increased risk of associated internal haemangiomatosis, especially of the liver.
- 2E81.2Y** Other specified benign vascular neoplasms of infancy and childhood
- 2E81.2Z** Benign vascular neoplasms of infancy and childhood, unspecified
- 2E81.Y** **Other specified benign vascular neoplasms**

- 2E8Y** **Other specified benign mesenchymal neoplasm**
- 2E8Z** **Benign mesenchymal neoplasms, unspecified**

Benign non-mesenchymal neoplasms (2E90-2F3Z)

- 2E90**      **Benign neoplasm of lip, oral cavity or pharynx**
- 2E90.0**      **Benign neoplasm of lip**  
A neoplasm without malignant characteristics arising from the lip.
- Exclusions:**      Benign neoplasm of skin of lip (2F20-2F2Z)
- 2E90.1**      **Benign neoplasm of tongue**  
Abnormal growth, without malignant characteristics, of the cells that comprise the tongue.
- 2E90.2**      **Benign neoplasm of floor of mouth**
- 2E90.3**      **Benign neoplasm of other or unspecified parts of mouth**  
**Exclusions:**      Benign neoplasm of nasopharyngeal surface of soft palate (2E90.6)  
benign odontogenic neoplasms (2E83.0)  
mucosa of lip (2E90.0)
- 2E90.4**      **Benign neoplasm of tonsil**  
**Exclusions:**      benign neoplasm of pharyngeal tonsil (2E90.6)  
benign neoplasm of lingual tonsil (2E90.1)  
benign neoplasm of tonsillar pillars (2E90.5)  
benign neoplasm of tonsillar fossa (2E90.5)
- 2E90.5**      **Benign neoplasm of oropharynx**  
A neoplasm of the oropharynx which is characterised by the absence of morphologic features associated with malignancy (severe cytologic atypia, tumour cell necrosis, and high mitotic rate). Benign neoplasms remain confined to the original site of growth and only rarely metastasize to other anatomic sites.  
**Exclusions:**      Benign neoplasm of epiglottis, NOS (2F00)  
Benign neoplasm of epiglottis, suprathyroid portion (2F00)
- 2E90.6**      **Benign neoplasm of nasopharynx**  
A neoplasm of the nasopharynx which is characterised by the absence of morphologic features associated with malignancy (severe cytologic atypia, tumour cell necrosis, and high mitotic rate). Benign neoplasms remain confined to the original site of growth and only rarely metastasize to other anatomic sites.
- 2E90.7**      **Benign neoplasm of hypopharynx**
- 2E90.8**      **Benign neoplasm of pharynx, unspecified**
- 2E91**      **Benign neoplasm of major salivary glands**  
**Exclusions:**      Benign neoplasms of minor salivary glands NOS (2E90.3)
- 2E91.0**      **Benign neoplasm of parotid gland**
- 2E91.1**      **Benign neoplasm of other specified major salivary glands**

<b>2E91.Z</b>	<b>Benign neoplasm of unspecified major salivary glands</b>
<b>2E92</b>	<p><b>Benign neoplasm of digestive organs</b></p> <p>A neoplasm of other and/or ill-defined parts of the digestive system which is characterised by the absence of morphologic features associated with malignancy (severe cytologic atypia, tumour cell necrosis, and high mitotic rate). <b>2E92.4Z</b>	Benign neoplasm of the large intestine, unspecified

- 2E92.5 Benign neoplasm of anus or anal canal**  
 Primary benign tumour that forms in tissues lining the anus and anal canal.
- Exclusions:**
- Benign neoplasm of perianal skin (2F20-2F2Z)
  - Benign neoplasm of anal margin (2F20-2F2Z)
  - Benign neoplasm of anal skin (2F20-2F2Z)
- 2E92.6 Benign neoplasm of gallbladder, extrahepatic bile ducts or ampulla of Vater**  
**Coded Elsewhere:** Benign mesenchymal tumour of gallbladder, extrahepatic bile ducts or ampulla of Vater (2E8Z)  
 Adenoma of bile ducts (2E92.6)
- 2E92.7 Benign neoplasm of liver or intrahepatic bile ducts**  
**Coded Elsewhere:** Focal nodular hyperplasia of liver (DB99.Y)  
 Angiomyolipoma of liver (2E80.02)  
 Haemangioma of liver (2E81.0Y)
- 2E92.8 Benign neoplasm of pancreas**  
 A non-metastasizing neoplasm arising from the pancreas.  
**Exclusions:** Benign neoplasm of endocrine pancreas (2E92.9)
- 2E92.9 Benign neoplasm of endocrine pancreas**  
**Inclusions:**
- Islet cell tumour
  - benign neoplasm of islets of Langerhans
- 2E92.Y Benign neoplasm of other specified digestive organs**
- 2E92.Z Benign neoplasm of unspecified digestive organs**
- Benign neoplasm of respiratory or intrathoracic organs (2F00-2F0Z)
- 2F00 Benign neoplasm of middle ear or respiratory system**
- 2F00.0 Middle ear endocrine tumour**
- 2F00.1 Recurrent respiratory papillomatosis**  
 Recurrent respiratory papillomatosis is a rare respiratory disease characterised by the development of exophytic papillomas, affecting the mucosa of the upper aerodigestive tract (with a strong predilection for the larynx), caused by an infection with human papilloma virus. Symptoms at presentation may include hoarseness, chronic cough, dyspnoea, recurrent upper respiratory tract infections, pneumonia, dysphagia, stridor, and/or failure to thrive.
- 2F00.2 Laryngeal endocrine tumour**
- 2F00.Y Other specified benign neoplasm of middle ear or respiratory system**
- 2F00.Z Benign neoplasm of middle ear or respiratory system, unspecified**

<b>2F01</b>	<b>Benign neoplasm of intrathoracic organs</b>
<b>2F0Y</b>	<b>Benign neoplasms of other specified respiratory and intrathoracic organs</b>
<b>2F0Z</b>	<b>Benign neoplasms of unspecified respiratory and intrathoracic organs</b>
<b>2F10</b>	<b>Benign neoplasm of mesothelial tissue</b> A benign neoplasm arising from mesothelial cells. It is characterised by the formation of glandular and tubular patterns. It can occur in several anatomic sites including the pleura, peritoneum, and epididymis.

### Benign cutaneous neoplasms (2F20-2F2Z)

Abnormal growth of the cells that comprise the tissues of the skin, without any evidence of malignancy.

**Coded Elsewhere:** Benign vascular neoplasms of infancy and childhood (2E81.2)

<b>2F20</b>	<b>Benign cutaneous melanocytic neoplasms</b>
	<i>Inclusions:</i>
	Mole
	Pigmented naevus
	Benign melanocytic naevus
<b>2F20.0</b>	<b>Common acquired melanocytic naevus</b>
<b>2F20.00</b>	Multiple benign melanocytic naevi The presence of multiple benign melanocytic naevi (often taken as more than 20 naevi >2mm in diameter), an independent risk factor for the development of melanoma with highest risk associated with highest numbers of naevi (>100).
<b>2F20.0Y</b>	Other specified common acquired melanocytic naevus
<b>2F20.0Z</b>	Common acquired melanocytic naevus, unspecified
<b>2F20.1</b>	<b>Atypical melanocytic naevus</b> Solitary or multiple, slightly raised, pigmented lesions with irregular borders, usually measuring more than 0.6cm in greatest dimension. Morphologically, there is melanocytic atypia and the differential diagnosis from melanoma may be difficult. Patients are at an increased risk for the development of melanoma.
	<i>Inclusions:</i>
	Dysplastic naevus, unspecified
<b>2F20.2</b>	<b>Congenital melanocytic naevus</b> Congenital melanocytic naevi are circumscribed areas of skin pigmentation present at birth as a result of abnormal intrauterine proliferation of melanocytes within the dermis, the epidermis or both. They may range in size from a few millimetres to many centimetres in diameter. If their projected or final adult maximal diameter is greater than 20 cm they are termed giant congenital melanocytic naevi.

- 2F20.20** Giant congenital melanocytic naevus  
A congenital melanocytic naevus (CMN) with a predicted or final adult maximal diameter of 400 mm or more. Giant CMNs are commonly centred on the dorsal surface of the body between the vertex and the buttocks but may occur elsewhere; they may be associated with multiple smaller satellite naevi (congenital or tardive), hypertrichosis, lipomas or benign proliferative nodules. There is a risk of pre-pubertal melanoma within giant CMN or the central nervous system (CNS). Leptomeningeal melanocytosis or focal neuromelanosis, found in 10-15% of cases, is often associated with other CNS tumours, hydrocephalus, epilepsy, arachnoid cysts, or Dandy-Walker malformation.
- 2F20.2Y** Other specified congenital melanocytic naevus
- 2F20.2Z** Congenital melanocytic naevus, unspecified
- 2F20.3** **Generalised eruptive melanocytic naevi**  
This phenomenon describes the rapid simultaneous appearance of multiple melanocytic naevi, often hundreds in number, on previously uninvolved sun-exposed skin. The phenomenon has been linked to immunosuppression, particularly in renal transplant recipients and in individuals receiving cancer chemotherapy, and may be considered a more advanced counterpart of generalised eruptive lentiginosis.
- Inclusions:**
- Multiple benign melanocytic naevi (2F20.00)
  - Generalized eruptive lentiginosis (ED61)
- 2F20.Y** Other specific types of melanocytic naevus
- 2F20.Z** Melanocytic naevus, unspecified
- 2F21** **Benign keratinocytic acanthomas**  
A group of benign discrete epidermal proliferative disorders including seborrhoeic keratosis and clear cell acanthoma.
- 2F21.0** **Seborrhoeic keratosis**  
Seborrhoeic keratoses are very common benign neoplasms of epidermal keratinocytes which increase in prevalence and number with age. They are commonly multiple and are very variable in shape and colour. Because of the sometimes intense pigmentation they are frequently mistaken for melanocytic tumours.
- Inclusions:**
- Basal cell papilloma
  - Seborrheic wart
- 2F21.Y** Other specified benign keratinocytic acanthomas
- 2F22** **Benign neoplasms of epidermal appendages**  
A range of benign neoplasms arising from the hair follicle, its associated glands or from sweat glands.

**2F23**

**Benign dermal fibrous or fibrohistiocytic neoplasms**

Benign dermal neoplasms due to abnormal proliferation of fibroblasts, myofibroblasts or primitive mesenchymal cells.

**2F23.0**

**Dermatofibroma**

A common benign skin tumour which presents as a firm dermal papule or nodule, most commonly on the lower limbs. Histologically it is characterised by coarse, haphazardly arranged collagen bundles and a variable cellular infiltrate including fibrocytes.

**2F23.Y**

**Other specified benign dermal fibrous or fibrohistiocytic neoplasms**

**2F24**

**Benign cutaneous neoplasms of neural or nerve sheath origin**

**2F25**

**Cherry angioma**

*Inclusions:*      Campbell de Morgan spot

Senile angioma

**2F26**

**Lobular capillary haemangioma**

Historically called pyogenic granuloma, this is a common benign proliferation of capillary blood vessels which may be induced by trauma or by certain drugs. It presents as one or more bright red papules or nodules often located around the mouth or on a terminal phalanx in relation to the nail. Bleeding, ulceration and crusting frequently occur. BRAF mutations within vascular endothelial cells may be present, indicating that this is, in at least a proportion of cases, a true neoplastic process.

*Inclusions:*      Lobular capillary haemangioma of skin

**2F2Y**

**Other specified benign cutaneous neoplasms**

**2F2Z**

**Benign cutaneous neoplasm of unspecified type**

**2F30**

**Benign neoplasm of breast**

A non-metastasizing neoplasm arising from the breast parenchyma.

*Exclusions:*      Benign neoplasm of skin of breast (2F20-2F2Z)

Lipoma (2E80.0)

**2F30.0**

**Tubular adenoma of breast**

A benign, well circumscribed neoplasm that arises from the breast. It is composed entirely of tubular structures that contain epithelial and myoepithelial cells.

**2F30.1**

**Lactating adenoma of breast**

A tubular type adenoma of the breast in which, during pregnancy and lactation, the epithelial cells show extensive secretory changes.

- 2F30.2      Intraductal papilloma of breast**  
A benign papillary neoplasm that arises anywhere in the ductal system of the breast. It is characterised by fibrovascular structures lined by benign epithelial and myoepithelial proliferations. Intraductal breast papillomas are classified as central, when they arise in large ducts, or peripheral, when they arise in the terminal ductal lobular units.
- 2F30.3      Benign phyllodes tumour of breast**  
A usually unilateral, benign and well circumscribed biphasic neoplasm that arises from the breast. It usually affects middle-aged women. It is characterised by the presence of a double layer of epithelial cells that are arranged in clefts, surrounded by a cellular, monomorphic spindle cell mesenchymal component. Mitoses are rare. Necrotic changes may be present in large tumours.
- 2F30.4      Fibromatosis of breast**
- 2F30.5      Fibroadenoma of breast**  
A benign tumour of the breast characterised by the presence of stromal and epithelial elements. It presents as a painless, solitary, slow growing, firm, and mobile mass. It is the most common benign breast lesion. It usually occurs in women of childbearing age. The majority of fibroadenomas do not recur after complete excision. A slightly increased risk of developing cancer within fibroadenomas or in the breast tissue of patients previously treated for fibroadenomas has been reported.
- 2F30.6      Extensive adenomatosis of nipple**  
Rare benign nipple condition presenting as pruritus, burning or pain symptoms with clinical signs showing a nipple which appears ulcerated, crusting, scaling, indurated and erythematous. Differential diagnosis are Paget, psoriasis, etc.
- 2F30.Y      Other specified benign neoplasm of breast**
- 2F30.Z      Benign neoplasm of breast, unspecified**
- 2F31      Benign non-mesenchymal neoplasms of uterus**  
Other non-malignant tumours of the uterus not detailed elsewhere.  
**Exclusions:**      Leiomyoma of uterus (2E86.0)
- 2F31.0      Benign non-mesenchymal neoplasm of uterus, cervix uteri**  
**Exclusions:**      Low grade squamous intraepithelial lesion of cervix uteri (GA15.7)
- 2F31.1      Benign non-mesenchymal neoplasm of uterus, corpus uteri**
- 2F31.2      Benign non-mesenchymal neoplasms of uterus, other parts**
- 2F32      Benign neoplasm of ovary**  
A non-metastasizing neoplasm that arises from the ovary. Representative examples include serous cystadenoma, mucinous cystadenoma, clear cell adenofibroma, benign Brenner tumour, thecoma, and fibroma.  
**Coded Elsewhere:** Struma ovarii (5A02.Y)

- 2F32.0 Cystic teratoma**  
A condition of the ovary, caused by abnormal proliferation due to genetic mutations, abnormal growth or division of germ cells. This condition is characterised by a benign ovarian neoplasm, and abdominal pain, mass or swelling, or abnormal uterine bleeding, and may lead to ovarian torsion or cystic rupture. Confirmation is by imaging.
- 2F32.1 Ovarian fibroma**  
A condition of the ovary, caused by abnormal proliferation due to genetic mutations, abnormal growth or division of cells. This condition is characterised by a benign sex chord ovarian tumour. Confirmation is by imaging.
- 2F32.2 Meigs' syndrome**  
Meigs' syndrome is classically defined as the triad of ascites, pleural effusion, and benign ovarian fibroma. A key feature found in patients with Meigs' syndrome is the resolution of symptoms after tumor resection. Meigs' syndrome is a rare condition that can only be diagnosed after ovarian carcinoma is ruled out.
- 2F32.3 Serous ovarian cystadenoma**
- 2F32.Y Other specified benign neoplasm of ovary**
- 2F32.Z Benign neoplasm of ovary, unspecified**
- 2F33 Benign neoplasm of other or unspecified female genital organs**  
A non-metastasizing neoplasm that arises from the female reproductive system. Representative examples include uterine corpus leiomyoma, endocervical polyp, and benign ovarian germ cell tumour.
- 2F34 Benign neoplasm of male genital organs**  
A non-metastasizing neoplasm that arises from the male reproductive system. Representative examples include benign prostate phyllodes tumour, benign Sertoli cell tumour, seminal vesicle cystadenoma, and epididymal adenomatoid tumour.
- 2F35 Benign neoplasm of urinary organs**  
A non-metastasizing neoplasm that arises from the organs that comprise the urinary system. Representative examples include renal oncocytoma, bladder inverted papilloma, and urothelial papilloma.
- 2F36 Benign neoplasm of eye or ocular adnexa**
- Exclusions:** Benign neoplasm of optic nerve (2A02.3)  
Benign neoplasm of skin of eyelid (2F20-2F2Z)
- Coded Elsewhere:** Epibulbar choristoma (LA14.06)  
Seborrhoeic keratosis (2F21.0)
- 2F36.0 Benign neoplasm of choroid**  
Abnormal growth of the cells of the choroid without malignant characteristics.
- Coded Elsewhere:** Haemangioma of choroid (2E81.0Y)

- 2F36.1**      **Benign neoplasm of iris**
- 2F36.2**      **Benign neoplasm of ciliary body**
- 2F36.3**      **Teratoma of orbit**  
This is an encapsulated tumour with tissue or organ components resembling normal derivatives of all three germ layers. This diagnosis is of the cavity or socket of the skull in which the eye and its appendages are situated.
- 2F36.4**      **Cysts of eyelid**  
**Coded Elsewhere:** Epidermoid cyst (EK70.0)
- 2F36.Y**      **Other specified benign neoplasm of eye or ocular adnexa**
- 2F36.Z**      **Benign neoplasm of eye or ocular adnexa, unspecified**
- 2F37**      **Benign neoplasm of endocrine glands**  
**Exclusions:**    Benign neoplasm of endocrine pancreas (2E92.9)  
                      Benign neoplasm of thymus (2F01)  
                      Benign neoplasm of ovary (2F32)  
                      Benign neoplasm of testis (2F34)  
                      Benign neoplasm of hypothalamus (2A00.5)
- 2F37.0**      **Non-secreting pituitary adenoma**
- 2F37.Y**      **Other specified benign neoplasm of endocrine glands**
- 2F37.Z**      **Benign neoplasm of endocrine glands, unspecified**
- 2F3Y**      **Benign non-mesenchymal neoplasms of other specified site**
- 2F3Z**      **Benign non-mesenchymal neoplasms of unspecified site**
- 
- 2F5Y**      **Other specified benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues**
- 2F5Z**      **Benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues, unspecified**

## **Neoplasms of uncertain behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues (2F70-2F7Z)**

A neoplasm displaying morphologic, phenotypic, or genotypic characteristics that are clearly not benign but do not permit the establishment of a definitive diagnosis of malignancy. Such neoplasms may or may not eventually have a more aggressive clinical course. Representative examples include lymphoproliferations of uncertain malignant potential (e.g., lymphomatoid granulomatosis and lymphomatoid papulosis), borderline ovarian epithelial neoplasms (e.g., borderline ovarian endometrioid tumour and borderline ovarian mucinous tumour), borderline exocrine pancreatic neoplasm (e.g., pancreatic borderline intraductal papillary-mucinous neoplasm), and primary borderline peritoneal epithelial neoplasm.

**Coded Elsewhere:** Pathological fracture in neoplastic disease of uncertain behaviour (FB80.B)

<b>2F70</b>	<b>Neoplasms of uncertain behaviour of oral cavity or digestive organs</b>
2F70.0	<b>Neoplasms of uncertain behaviour of lip, oral cavity or pharynx</b>
2F70.1	<b>Neoplasms of uncertain behaviour of stomach</b>
2F70.2	<b>Neoplasms of uncertain behaviour of small intestine</b>
2F70.3	<b>Neoplasms of uncertain behaviour of colon</b>
2F70.4	<b>Neoplasms of uncertain behaviour of rectum</b>
2F70.5	<b>Neoplasms of uncertain behaviour of liver, gallbladder or bile ducts</b>
2F70.Y	<b>Neoplasms of uncertain behaviour of oral cavity and digestive organs, other specified site</b>
2F70.Z	<b>Neoplasms of uncertain behaviour of oral cavity and digestive organs, unspecified site</b>
<b>2F71</b>	<b>Neoplasms of uncertain behaviour of middle ear, respiratory or intrathoracic organs</b>
2F71.0	<b>Neoplasms of uncertain behaviour of thymus</b>
2F71.1	<b>Neoplasms of uncertain behaviour of larynx</b>
2F71.2	<b>Neoplasms of uncertain behaviour of pleura</b>
2F71.3	<b>Neoplasms of uncertain behaviour of trachea, bronchus or lung</b>
2F71.4	<b>Neoplasms of uncertain behaviour of mediastinum</b>
2F71.Y	<b>Neoplasms of uncertain behaviour of middle ear, respiratory and intrathoracic organs, other specified site</b>
2F71.Z	<b>Neoplasms of uncertain behaviour of middle ear, respiratory and intrathoracic organs, unspecified site</b>
<b>2F72</b>	<b>Neoplasms of uncertain behaviour of skin</b>

2F72.1	<b>Spitzoid tumour of uncertain malignant potential</b> A spindle cell and epithelioid cell melanocytic neoplasm in which there are sufficient features distinguishing it from a benign Spitz naevus to cast doubt on its benign nature. These atypical features include development in adult life, asymmetry, large diameter (>6 and especially >10 mm), significant thickness (particularly subcutaneous extension), lack of "maturation" and nodule formation, cytological atypia and a high mitotic rate.
2F72.2	<b>Melanocytic naevus with severe melanocytic dysplasia</b> Melanocytic naevus with severe melanocytic dysplasia is a histopathological diagnosis based on the presence of severe cytological atypia, defined as enlarged, spindle- and epithelioid-shaped melanocytes with hyperchromatic nuclei (typically at least twice the size of those of basal keratinocytes) and distinct nucleoli. Such naevi tend to be irregular in size and pigmentation and to have been excised because of concern that they may represent early melanoma.
2F72.Y	<b>Other specified neoplasms of uncertain behaviour of skin</b>
2F73	<b>Neoplasms of uncertain behaviour of retroperitoneum</b>
2F74	<b>Neoplasms of uncertain behaviour of peritoneum</b>
2F75	<b>Neoplasms of uncertain behaviour of breast</b>
2F76	<b>Neoplasms of uncertain behaviour of female genital organs</b>
2F77	<b>Neoplasms of uncertain behaviour of male genital organs</b>
2F78	<b>Neoplasms of uncertain behaviour of urinary organs</b>
2F79	<b>Neoplasms of uncertain behaviour of eye or ocular adnexa</b>
2F7A	<b>Neoplasms of uncertain behaviour of endocrine glands</b>
2F7A.0	<b>Multiple polyglandular tumours</b> <i>Coded Elsewhere:</i> Carney complex (5A70.Y) Von Hippel-Lindau disease (5A75)
2F7A.Y	<b>Other specified neoplasms of uncertain behaviour of endocrine glands</b>
2F7A.Z	<b>Neoplasms of uncertain behaviour of endocrine glands, unspecified</b>
2F7B	<b>Neoplasms of uncertain behaviour of bone or articular cartilage</b>
2F7C	<b>Neoplasms of uncertain behaviour of connective or other soft tissue</b>
2F7Y	<b>Neoplasms of uncertain behaviour of other specified site</b>
2F7Z	<b>Neoplasms of uncertain behaviour of unspecified site</b>

**Neoplasms of unknown behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues (2F90-2F9Z)**

**Coded Elsewhere:** Pathological fracture in neoplastic disease of unknown behaviour (FB80.B)

<b>2F90</b>	<b>Neoplasms of unknown behaviour of oral cavity or digestive organs</b>
<b>2F90.0</b>	<b>Neoplasms of unknown behaviour of colon</b>
<b>2F90.1</b>	<b>Neoplasms of unknown behaviour of rectum</b>
<b>2F90.Y</b>	<b>Neoplasms of unknown behaviour of oral cavity and digestive organs, other specified site</b>
<b>2F90.Z</b>	<b>Neoplasms of unknown behaviour of oral cavity and digestive organs, unspecified site</b>
<b>2F91</b>	<b>Neoplasms of unknown behaviour of middle ear, respiratory or intrathoracic organs</b>
<b>2F91.0</b>	<b>Neoplasms of unknown behaviour of larynx</b>
<b>2F91.1</b>	<b>Neoplasms of unknown behaviour of trachea, bronchus or lung</b>
<b>2F91.Y</b>	<b>Neoplasms of unknown behaviour of other specified respiratory organ, intrathoracic organ or middle ear</b>
<b>2F91.Z</b>	<b>Neoplasms of unknown behaviour of unspecified respiratory organ or intrathoracic organ</b>
<b>2F92</b>	<b>Neoplasms of unknown behaviour of skin</b>
<b>2F93</b>	<b>Neoplasms of unknown behaviour of retroperitoneum</b>
<b>2F94</b>	<b>Neoplasms of unknown behaviour of peritoneum</b>
<b>2F95</b>	<b>Neoplasms of unknown behaviour of breast</b>
<b>2F96</b>	<b>Neoplasms of unknown behaviour of female genital organs</b>
<b>2F97</b>	<b>Neoplasms of unknown behaviour of male genital organs</b>
<b>2F98</b>	<b>Neoplasms of unknown behaviour of urinary organs</b>
<b>2F99</b>	<b>Neoplasms of unknown behaviour of eye or ocular adnexa</b>

<b>2F9B</b>	<b>Neoplasms of unknown behaviour of bone or articular cartilage</b>
<b>2F9C</b>	<b>Neoplasms of unknown behaviour of connective or other soft tissue</b>
<b>2F9Y</b>	<b>Neoplasms of unknown behaviour of other specified site</b>
<b>2F9Z</b>	<b>Neoplasms of unknown behaviour of unspecified site</b>

# CHAPTER 03

---

## Diseases of the blood or blood-forming organs

This chapter has 56 four-character categories.

Code range starts with 3A00

This chapter includes diseases of the blood as well as diseases of blood forming organs.

- Exclusions:**
- Complications of pregnancy, childbirth or the puerperium (Chapter 18)
  - Diseases of the immune system (Chapter 04)
  - Certain conditions originating in the perinatal period (Chapter 19)
  - Injury, poisoning or certain other consequences of external causes (Chapter 22)
  - Human immunodeficiency virus disease (1C60-1C62.Z)
  - Endocrine, nutritional or metabolic diseases (Chapter 05)
  - Congenital malformations, deformations or chromosomal abnormalities (Chapter 20)
  - Other diseases of the blood or blood-forming organs or certain disorders involving the immune mechanism complicating pregnancy, childbirth or the puerperium (JB64.1)

**Coded Elsewhere:** Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

Symptoms, signs or clinical findings of blood, blood-forming organs, or the immune system (MA10-MA3Y)

This chapter contains the following top level blocks:

- Anaemias or other erythrocyte disorders
- Coagulation defects, purpura or other haemorrhagic or related conditions
- Diseases of spleen

## Anaemias or other erythrocyte disorders (3A00-3A9Z)

**Inclusions:** Anaemia, unspecified

**Coded Elsewhere:** Anaemia complicating pregnancy, childbirth or the puerperium (JB64.0)  
Anaemia of prematurity (KA8B)

### Nutritional or metabolic anaemias (3A00-3A03.Y)

**3A00**

#### **Iron deficiency anaemia**

A disease caused by chronic or acute bleeding, excessive menstrual bleeding, inadequate intake, substances (in diet or drugs) interfering with iron absorption, malabsorption syndromes, inflammation, infection or blood donation. This disease is characterised by decreased levels of iron present in the body. This disease may present with fatigue, pallor or dizziness. Confirmation is by identification of decreased levels of iron in a blood sample.

**3A00.0**

#### **Acquired iron deficiency anaemia due to blood loss**

Chronic blood loss is a possible cause in every case of iron-deficiency anaemia. Iron deficiency anaemia may be caused by acute bleeding in gastrointestinal tract, uterus or genitourinary system, copious menstrual blood losses (menorrhagia) and multiple blood donations. In many tropical countries, infestations with hookworms lead to intestinal blood losses that in some individuals can be considerable. Iron deficiency may also be caused by several circumstances related to "chronic posthaemorrhagic anaemia". A diagnosis of iron deficiency should always lead to a search for pathologic causes of blood loss (e.g. tumours in the gastrointestinal tract or uterus, especially if uterine bleedings have increased or changed in regularity).

**Exclusions:** congenital anaemia from fetal blood loss (KA8C)

**3A00.01**

#### Chronic posthaemorrhagic anaemia

Chronic iron-deficiency anaemia from bleeding may be caused by colon cancer, gastric cancer, peptic ulcer, Meckel diverticulum, hiatal hernia with linear erosions, colonic vascular ectasia, colonic polyps, haemangioma, inflammatory bowel disease, tumours in the gastrointestinal tract or uterus, and chronic menorrhagia. Some infants with severe iron deficiency have chronic intestinal blood loss induced by exposure to cow's milk protein. Repeated phlebotomy for blood tests is a cause of anaemia of prematurity.

**3A00.02**

Acquired iron deficiency anaemia due to blood loss, unspecified

**3A00.1**

#### **Acquired iron deficiency anaemia due to low intake**

Iron deficiency is probably the most common nutritional deficiency disorder in the world. Iron deficiency anaemia during pregnancy increases perinatal risks for mothers and neonates; and increases overall infant mortality. Severe anaemia is a major risk factor associated with greatly increased morbidity and mortality for young children and pregnant women. Prompt recognition of the condition, treatment and clinical follow-up of individuals are crucial in avoiding complications such as high-output heart failure. Maternal iron deficiency during pregnancy increases the risk of iron deficiency in the infant. In less developed countries, the prevalence of iron deficiency during pregnancy is higher than in developed countries, and iron supplementation during pregnancy is beneficial.

- 3A00.2**      **Acquired iron deficiency anaemia due to decreased absorption**
- 3A00.3**      **Acquired iron deficiency anaemia due to increased requirement**
- 3A00.Y**      **Other specified iron deficiency anaemia**
- 3A00.Z**      **Iron deficiency anaemia, unspecified**

**3A01**

**Megaloblastic anaemia due to vitamin B12 deficiency**

A disease caused by inadequate dietary intake of vitamin B12, impaired absorption of vitamin B12, surgical removal of the small bowel, coeliac disease or inherited mutations affecting absorption of vitamin B12. This disease is characterised by decreased levels of vitamin B12 in the body presenting with or without anaemia. This disease may present with fatigue, pallor, dizziness, seizures, or symptoms of dementia. Confirmation is by identification of decreased levels of vitamin B12 in a blood sample.

- 3A01.0**      **Hereditary vitamin B12 deficiency anaemia**

This is a hereditary low blood level of vitamin B12. It can cause permanent damage to nervous tissue if left untreated long enough. Vitamin B12 itself was discovered through investigation of pernicious anaemia, which is an autoimmune disease that destroys parietal cells in the stomach that secrete intrinsic factor.

- 3A01.1**      **Neonatal vitamin B12 deficiency anaemia**

A disease caused by a lack of vitamin B12 in the mother, which is passed onto the fetus in the antenatal period or to the neonate during breast feeding. This disease is characterised by decreased levels of vitamin B12. This disease may present with increased risk of birth defects or preterm delivery, anaemia, irritability, failure to thrive or apathy. Confirmation is by identification of low levels of vitamin B12 in a blood sample.

**Exclusions:**      Hereditary vitamin B12 deficiency anaemia (3A01.0)

- 3A01.2**      **Vitamin B12 deficiency anaemia due to low intake**

A disease caused by insufficient intake of vitamin B12 into the body. This disease is characterised by low levels of vitamin B12 leading to low levels of red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of vitamin B12 and red blood cell count in a blood sample.

- 3A01.3**      **Vitamin B12 deficiency anaemia due to intrinsic factor deficiency**

**Exclusions:**      Vitamin B12 deficiency anaemia due to congenital intrinsic factor deficiency (3A01)

- 3A01.30**      Pernicious anaemia

Acquired pernicious anaemia, also called Biermer's disease, is a disorder in vitamin B12 (cobalamin) absorption characterised by megaloblastic anaemia and gastrointestinal symptoms, and that can lead to neurological abnormalities.

- 3A01.3Y**      Other specified vitamin B12 deficiency anaemia due to intrinsic factor deficiency

<b>3A01.4</b>	<b>Vitamin B12 deficiency anaemia due to intestinal disease</b>
	A number of intestinal disorders can also cause vitamin B12 (cobalamin) deficiency. These include severe pancreatic diseases and small bowel diseases such as malabsorption, ileal disease (including tuberculous ileitis, lymphoma, amyloid, long-term survivors of pelvic irradiation), extensive small bowel resection or bypass, gastric surgery/reconstruction for obesity (bariatric surgery) and Crohn's disease. When jejunal blind loops are present, bacterial overgrowth within the loops competes for cobalamin, leading to cobalamin deficiency. Although not as common currently, infestation with the fish tapeworm, <i>Diphyllobothrium latum</i> , was once a classic cause of cobalamin deficiency.
<b>Coding Note:</b>	Code also the causing condition
<b>3A01.5</b>	<b>Drug-induced vitamin B12 deficiency anaemia</b>
<b>3A01.Y</b>	<b>Other specified megaloblastic anaemia due to vitamin B12 deficiency</b>
<b>3A01.Z</b>	<b>Megaloblastic anaemia due to vitamin B12 deficiency, unspecified</b>
<b>3A02</b>	<b>Folate deficiency anaemia</b>
<b>3A02.0</b>	<b>Hereditary folate deficiency anaemia</b>
<b>3A02.1</b>	<b>Folate deficiency anaemia due to low intake</b>
<b>3A02.2</b>	<b>Folate deficiency anaemia due to increased requirements</b>
<b>3A02.3</b>	<b>Folate deficiency anaemia due to decreased intestinal absorption</b> A disease caused by determinants affecting intestinal absorption of folate arising after birth. This disease is characterised by low levels of folate in the body leading to incomplete formation of red blood cells resulting in large numbers of immature and incompletely developed red blood cells. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, tachycardia or extremity paraesthesia. Confirmation is by identification of low folate levels in a blood sample.
<b>Coding Note:</b>	Code also the causing condition
<b>3A02.4</b>	<b>Drug-induced folate deficiency anaemia</b>
<b>3A02.Y</b>	<b>Other specified folate deficiency anaemia</b>
<b>3A02.Z</b>	<b>Folate deficiency anaemia, unspecified</b>
<b>3A03</b>	<b>Other nutritional or metabolic anaemias</b> A disease caused by nutritional and metabolic determinants leading to anaemia. This disease is characterised by decreased levels of red blood cells within the body. This disease may present with fatigue, pallor or dizziness. Confirmation is by identification of a decreased red blood cell count in a blood sample.
	<b>Coded Elsewhere:</b> Disorders of pyrimidine metabolism (5C55.1)
	Lesch-Nyhan syndrome (5C55.01)

- 3A03.0      Hereditary orotic aciduria**  
Hereditary orotic aciduria is an extremely rare (less than 20 cases identified worldwide) autosomal recessive disorder characterised by retarded growth, anaemia and excessive urinary excretion of orotic acid. It is due to a severe deficiency in the activity of the pyrimidine pathway enzyme uridine 5'-monophosphate (UMP) synthase (bifunctional enzyme containing two activities: orotate phosphoribosyltransferase and orotidine 5'-monophosphate decarboxylase), coded by a single gene (UMPS) localised to chromosome 3q13.
- 3A03.1      Protein deficiency anaemia**  
A disease caused by low levels of protein within the body. This disease is characterised by a low red blood cell count in the blood. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of a low red blood cell count in a blood sample.  
**Exclusions:**      Lesch-Nyhan syndrome (5C55.01)
- 3A03.2      Scorbutic anaemia**  
Scorbutic anaemia is a common finding in infants and young children with scurvy and is related to impaired iron absorption and coexistent haematopoietic nutrient deficiencies including iron, vitamin B12 and folate.
- 3A03.3      Copper deficiency anaemia**  
Anaemia due to copper deficiency arises from impaired utilization of iron and is therefore a conditioned form of iron deficiency anaemia.
- 3A03.4      Acquired other vitamin B deficiency anaemia**  
A disease caused by a lack of B vitamins in the body arising after birth. This disease is characterised by low levels of B vitamins leading to low levels of red blood cells in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count and low B vitamin counts in a blood sample.
- 3A03.40      Acquired pyridoxine deficiency anaemia**  
A disease caused by determinants arising after birth. This disease is characterised by low levels of pyridoxine (vitamin B6) leading to low levels of red blood cells in the body. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities. Confirmation is by identification of low levels of pyridoxine and low red blood cell count in a blood sample.
- 3A03.41      Acquired riboflavin deficiency anaemia**  
A disease caused by determinants arising after birth. This disease is characterised by low levels of riboflavin (vitamin B2) leading to low levels of red blood cells in the body. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities. Confirmation is by identification of low levels of riboflavin and low red blood cell count in a blood sample.

<b>3A03.42</b>	Acquired thiamine deficiency anaemia A disease caused by a lack of thiamine arising after birth. This disease is characterised low levels of thiamine in the body leading to low levels of red blood cells. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities. Confirmation is by identification of low levels of thiamine and low red blood cell count in a blood sample.
<b>3A03.4Y</b>	Other specified acquired other vitamin B deficiency anaemia
<b>3A03.5</b>	<b>Acquired vitamin A deficiency anaemia</b>
<b>3A03.6</b>	<b>Acquired vitamin E deficiency anaemia</b> <i>Inclusions:</i> Haemolytic anaemia due to vitamin E deficiency
<b>3A03.Y</b>	<b>Other and unspecified nutritional or metabolic anaemia</b>

#### Haemolytic anaemias (3A10-3A4Z)

A disease caused by determinants arising after birth, during the antenatal period or genetically inherited factors leading to premature haemolysis of red blood cells. This disease is characterised by low levels of red blood cells in the body due to abnormal breakdown of the cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

#### Congenital haemolytic anaemia (3A10-3A1Y)

A disease caused by determinants arising in the antenatal period. This disease is characterised by low levels of red blood cells in the body due to abnormal destruction of the red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

**Coded Elsewhere:** Haemolytic disease of fetus or newborn (KA84)

<b>3A10</b>	<b>Hereditary haemolytic anaemia</b>
<b>3A10.0</b>	<b>Haemolytic anaemias due to hexose monophosphate shunt or glutathione metabolism anomalies</b> This is a form of anaemia due to haemolysis, the abnormal breakdown of red blood cells (RBCs), either in the blood vessels (intravascular haemolysis) or elsewhere in the human body (extravascular). This diagnosis is due to a process that generates NADPH and pentoses (5-carbon sugars) and glutathione metabolism anomalies.
<b>3A10.00</b>	Haemolytic anaemia due to glucose-6-phosphate dehydrogenase deficiency Glucose-6-phosphate dehydrogenase (G6PD) deficiency is the most common hereditary erythrocyte enzyme deficiency that can manifest with severe neonatal jaundice which can lead to serious neurological consequences, or, most often, with acute haemolytic anaemia following ingestion of certain foods (fava beans), common drugs (some antimalaria drugs, sulphonamides, analgesics), or in the course of an infection, in otherwise asymptomatic individuals.

- 3A10.0Y** Other specified haemolytic anaemias due to hexose monophosphate shunt or glutathione metabolism anomalies
- 3A10.0Z** Haemolytic anaemias due to hexose monophosphate shunt or glutathione metabolism anomalies, unspecified
- 3A10.1** **Haemolytic anaemia due to adenosine deaminase excess**
- 3A10.2** **Hereditary elliptocytosis**  
Hereditary elliptocytosis is a group of rare conditions caused by abnormalities in the red cell cytoskeleton and marked by the presence on blood smears of numerous elliptical red blood cells, called elliptocytes. Clinical presentations are highly heterogeneous ranging from asymptomatic forms to more severe forms associated with variable anaemia, from moderate to severe and with pyropoikilocytosis including fragmented red cells, microelliptocytes and microspherocytes.
- 3A10.3** **Familial pseudohyperkalaemia**  
A disease caused by a genetically inherited mutation. This disease is characterised by a temperature-dependent defect in red cell membrane permeability to potassium that leads to high in vitro potassium levels in samples stored below 37°C leading to elevated potassium levels in the blood that does not reflect the true potassium level. Confirmation is by identification of genetic mutation through genetic testing.
- 3A10.Y** **Other specified hereditary haemolytic anaemia**
- 3A10.Z** **Hereditary haemolytic anaemia, unspecified**
- 3A1Y** **Other specified congenital haemolytic anaemia**

### Acquired haemolytic anaemia (3A20-3A2Z)

A disease characterised by premature destruction of red blood cells arising after birth. This disease is further characterised by low levels of red blood cells in the body due to abnormal destruction of the cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

- 3A20** **Acquired haemolytic anaemia, immune**  
A condition characterised by antibodies that are directed against red blood cells in an autoimmune reaction leading to low levels of red blood cells. This condition may present with pallor, fatigue, shortness of breath. Confirmation is by identification of antibodies in a blood sample and positive Coombs test result.

**3A20.0****Autoimmune haemolytic anaemia, warm type**

Autoimmune haemolytic anaemia (AIHA) is an autoimmune disorder in which various types of auto-antibodies are directed against red blood cells causing their survival to be shortened and resulting in haemolytic anaemia. AIHA can be primary (idiopathic), secondary to infection or associated with diseases such as B-cell lymphomas, other systemic or organ-specific autoimmune diseases, Hodgkin's disease, hepatitis or primary immunodeficiencies, or, in the case of drug-induced AIHA, caused by a reaction to drugs.

- Exclusions:**
- Evans syndrome (3A20.5)
  - Haemolytic disease of fetus or newborn (KA84)
  - Paroxysmal cold haemoglobinuria (3A20.3)

**3A20.1****Autoimmune haemolytic anaemia, cold type**

Cold autoimmune haemolytic anaemia comprises two types of autoimmune haemolytic anaemia (AIHA) defined by the presence of cold autoantibodies (autoantibodies which are active at temperatures below 30°C): cold agglutinin disease (CAD), which is the more common, and paroxysmal cold haemoglobinuria (PCH). CAD is more common in people over the age of 55 years, while PCH typically presents in young children. CAD is caused by IgM autoantibodies while PCH is caused by an IgG immunoglobulin.

- Exclusions:**
- Immune thrombocytopenic purpura (3B64.10)
  - Haemolytic disease of fetus or newborn (KA84)

**3A20.2****Autoimmune haemolytic anaemia, mixed type, cold and warm**

Mixed autoimmune haemolytic anaemia is a type of autoimmune haemolytic anaemia (AIHA) defined by the presence of both warm and cold autoantibodies, which have a deleterious effect on red blood cells at either body temperature or at lower temperatures.

**3A20.3****Paroxysmal cold haemoglobinuria**

Paroxysmal cold hemoglobinuria is a very rare subtype of autoimmune haemolytic anaemia (AIHA), caused by the presence of cold-reacting autoantibodies in the blood and characterised by the sudden presence of hemoglobinuria, typically after exposure to cold temperatures. PCH is thought to account for at most 2-10% of cases of AIHA.

**3A20.4****Alloimmune haemolytic anaemia**

A disease caused by determinants such as a blood transfusion that lead to an immune response directed against the person's own red blood cells. This disease is characterised by low levels of red blood cells in the body due to abnormal destruction of the red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

- Exclusions:**
- Haemolytic disease of fetus or newborn (KA84)

<b>3A20.5</b>	<b>Evans syndrome</b> Evans syndrome is characterised by the association of autoimmune haemolytic anaemia with another haematological anomaly. The thrombocytopenia may precede, occur concurrently with, or secondary to the autoimmune haemolytic anaemia.
<b>3A20.Y</b>	<b>Other specified acquired haemolytic anaemia, immune</b>
<b>3A21</b>	<b>Acquired haemolytic anaemia, non-immune</b> A disease caused by determinants such as infection, toxic chemicals, drugs and trauma arising after birth. This disease is characterised by haemolysis of red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of decreased red blood cell count in a blood sample and negative Coombs test result.
<b>3A21.0</b>	<b>Paroxysmal nocturnal haemoglobinuria</b> Paroxysmal nocturnal hemoglobinuria (PNH) is an acquired clonal hematopoietic stem cell disorder characterised by corpuscular haemolytic anaemia, bone marrow failure and frequent thrombotic events.  <i>Exclusions:</i> haemoglobinuria NOS (MF94) Aplastic anaemia with paroxysmal nocturnal haemoglobinuria (3A70.1)
<b>3A21.1</b>	<b>Microangiopathic haemolytic anaemia</b> This is a microangiopathic subgroup of haemolytic anaemia (loss of red blood cells through destruction) caused by factors in the small blood vessels. It is identified by the finding of anaemia and schistocytes on microscopy of the blood film.
<b>3A21.2</b>	<b>Haemolytic uraemic syndrome</b> <i>Exclusions:</i> Hereditary haemolytic uraemic syndrome (3A10)
<b>3A21.Y</b>	<b>Other specified acquired haemolytic anaemia, non-immune</b>
<b>3A2Z</b>	<b>Acquired haemolytic anaemia, unspecified</b>
<b>3A4Z</b>	<b>Haemolytic anaemias, unspecified</b>
<b>3A50</b>	<b>Thalassaemias</b> A disease caused by genetically inherited autosomal recessive mutations leading to abnormal production of haemoglobin. This disease is characterised by destruction of red blood cells leading to anaemia and abnormal production of haemoglobin. This disease may present with pallor, jaundice, iron overload, fatigue, or shortness of breath. Confirmation is by identification of mutations through genetic testing.
<b>3A50.0</b>	<b>Alpha thalassaemia</b> Alpha-thalassemia is an inherited haemoglobinopathy characterised by impaired synthesis of alpha-globin chains leading to a variable clinical picture depending on the number of affected alleles, and encompassing the alpha thalassaemia trait, haemoglobin H disease (HbH) and Bart's hydrops fetalis.  <i>Exclusions:</i> Hydrops fetalis due to haemolytic disease (KA85)

- 3A50.00** Mild alpha thalassaemia diseases  
 A disease caused by genetically inherited factors affecting the alpha chain of the haemoglobin molecule. This disease is characterised by structural abnormalities of the haemoglobin molecule. This disease may present with mild anaemia: pallor, fatigue, shortness of breath. Confirmation is by identification of changes to the alpha chain by genetic testing.
- 3A50.01** Thalassaemic alpha-chain variants
- 3A50.02** Haemoglobin H disease (- α/- – included)  
 Haemoglobin H (HbH) disease is a moderate to severe form of alpha-thalassemia characterised by pronounced microcytic hypochromic haemolytic anaemia.
- 3A50.03** Homozygous or compound heterozygous alpha0 thalassaemia  
 Hb Bart's hydrops fetalis is the most severe form of alpha-thalassemia and is almost always lethal. It is characterised by fetal onset of generalised oedema, pleural and pericardial effusions, and severe hypochromic anaemia.
- 3A50.0Y** Other specified alpha thalassaemia
- 3A50.0Z** Alpha thalassaemia, unspecified
- 3A50.1** **Alpha thalassaemia related syndromes**  
 Alpha-thalassemia-related diseases refers to a group of diseases characterised by alpha-thalassemia and an associated disorder. Three conditions are included in this group: alpha-thalassemia-intellectual deficit syndrome, X-linked (or ATR-X syndrome), alpha-thalassemia-intellectual deficit syndrome and alpha-thalassemia-myelodysplastic disease or ATMDS.
- 3A50.2** **Beta thalassaemia**  
 Beta-thalassemia (BT) is a haemoglobinopathy characterised by deficiency (Beta+) or absence (Beta0) of synthesis of the beta globin chains of haemoglobin (Hb). Three main types of BT have been described: minor, intermedia and major with clinical presentation ranging from asymptomatic forms to microcytic anaemia and splenomegaly due to defective erythropoiesis and haemolysis.
- 3A50.3** **Delta, delta-beta or gamma-delta-beta thalassaemia**  
 Delta-beta-thalassemia is a form of beta-thalassemia characterised by decreased or absent synthesis of the delta- and beta-globin chains with a compensatory increase in expression of fetal gamma-chain synthesis.
- 3A50.4** **Hereditary persistence of fetal haemoglobin**  
 Hereditary persistence of fetal haemoglobin (HPFH) associated with beta-thalassaemia is a haemoglobinopathy characterised by high haemoglobin (Hb)F levels and an increased number of fetal-Hb-containing cells. The association of HPFH with beta-thalassaemia mitigates the clinical manifestations which vary from a normal state to beta-thalassaemia intermedia.
- 3A50.Y** **Other specified thalassaemias**
- 3A50.Z** **Thalassaemias, unspecified**

**3A51**

### **Sickle cell disorders or other haemoglobinopathies**

Any disorder caused by a HbS mutation in the haemoglobin gene. This disorder is characterised by abnormal rigid sickle-shaped red blood cells decreasing its ability to carry oxygen. This disorder may present with fatigue, shortness of breath, dizziness, headaches, pallor of skin or mucous membranes, and jaundice. This disorder is confirmed by identification of HbS mutation by genetic testing.

**Coded Elsewhere:** Osteonecrosis due to haemoglobinopathy (FB81.4)

Other sickle-cell disorders with retinopathy (9B71.Y)

**3A51.0**

#### **Sickle cell trait**

A disease caused by genetic inheritance of one abnormal allele of the haemoglobin gene. This disease does not display the severe symptoms of sickle cell disease that occurs in homozygous individuals. Confirmation is by identification of mutation through genetic testing.

**3A51.1**

#### **Sickle cell disease without crisis**

A disorder caused by a HbS mutation in the haemoglobin gene. This disorder is characterised by abnormal rigid sickle-shaped red blood cells decreasing its ability to carry oxygen. This disorder may present with fatigue, shortness of breath, dizziness, headaches, pallor of skin or mucous membranes, and jaundice. This disorder is confirmed by identification of HbS mutation by genetic testing.

**3A51.2**

#### **Sickle cell disease with crisis**

Sickle cell crisis occurs when the sickle cells block blood flow, thus decreasing oxygen delivery to the tissues. This results in intense to severe pain in the extremities, lower back, abdomen, and chest. A crisis can be brought on by illness, stress, dehydration, exposure to temperature changes or high altitudes.

**Inclusions:** Hb-SS disease with crisis

**3A51.3**

#### **Compound heterozygous sickling disorders without crisis**

A disease caused by genetic inheritance of two heterozygous recessive alleles of the haemoglobin gene leading to abnormal formation of haemoglobin molecule. This disease is characterised by rigid, sickle shaped red blood cells. Confirmation is by identification of mutations through genetic testing.

**3A51.4**

#### **Compound heterozygous sickling disorders with crisis**

Compound heterozygous sickling disorders with crisis may present with acute chest syndrome, splenic sequestration, haemolytic crisis, and pain.

**3A51.5**

#### **Haemoglobin C disease**

A disease caused by the bi-parental gene that encodes for haemoglobin C. This disease is characterised by abnormal structure of one of the globin chains of the haemoglobin molecule. This disease may present with mild haemolytic anaemia, increased risk for gallstones, enlarged spleen, episodes of joint pain, and increased risk of infection. This disease is confirmed by identification of the haemoglobin C gene by genetic testing.

**Exclusions:** Hereditary persistence of fetal haemoglobin (3A50.4)

- 3A51.6      Haemoglobin D disease**  
Haemoglobin D (Hb D) disease is characterised by mild haemolytic anaemia and mild to moderate splenomegaly. Prevalence is unknown. Heterozygous forms of Hb D are clinically silent. Molecular testing can be useful to distinguish Hb D homozygosity from cases of heterozygous Hb D in association with beta-(0) thalassaemia.
- 3A51.7      High affinity haemoglobin**  
A disease caused by determinants arising after birth, in the antenatal period or by genetically inherited factors leading to high oxygen affinity haemoglobin. This disease is characterised by abnormalities in the globin chains that alter the affinity of the haemoglobin molecule for oxygen, affecting the normal loading of oxygen in the lungs and delivery of oxygen to the tissues.
- 3A51.8      Low affinity haemoglobin**  
A disease caused by determinants arising after birth, in the antenatal period or by genetically inherited factors leading to low oxygen affinity haemoglobin. This disease is characterised by abnormalities in the globin chains that alter the affinity of the haemoglobin molecule for oxygen, affecting the normal loading of oxygen in the lungs and delivery of oxygen to the tissues. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities.
- 3A51.9      Haemoglobin O disease**  
A disease caused by the bi-parental inheritance of the gene that encodes for haemoglobin O. This disease is characterised by abnormal structure of one of the globin chains of the haemoglobin molecule. This disease may present with mild haemolytic anaemia, increased risk for gallstones, enlarged spleen, episodes of joint pain, and increased risk of infection. This disease is confirmed by identification of the haemoglobin O gene by genetic testing.
- 3A51.A      Haemoglobin E disease**  
Haemoglobin E disease is characterised by the synthesis of an abnormal haemoglobin called haemoglobin E (HbE), instead of the normal haemoglobin A (HbA). Subjects heterozygous for HbE (AE) have an asymptomatic condition with no clinical relevance, except for the risk of transmitting E/beta thalassemia if the other parent carries beta thalassemia. The severity of these E/beta thalassemia forms is very variable, the clinical picture ranging from that of beta thalassemia minor through to thalassemia intermedia to thalassemia major. Subjects homozygous for HbE (EE) are asymptomatic.
- 3A51.B      Haemoglobin C/beta thalassaemia compound heterozygosity**  
Haemoglobin C/beta thalassaemia is a condition resulting from coinheritance of haemoglobin C and beta thalassaemia, both beta globin genes being mutated.
- 3A51.Y      Other specified sickle cell disorders or other haemoglobinopathies**
- 3A51.Z      Sickle cell disorders or other haemoglobinopathies, unspecified**

Pure red cell aplasia (3A60-3A6Z)

A condition caused by determinates arising during the antenatal period, after birth or genetically inherited factors, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurring in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of abnormally formed erythrocytes in a blood sample.

**3A60**

**Congenital pure red cell aplasia**

A condition caused by determinants arising during the antenatal period, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurring in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of decreased red blood cell count in a blood sample.

**3A60.0**

**Congenital non-inherited pure red cell aplasia**

A condition caused by determinates arising during the antenatal period, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurring in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of decreased levels of red blood cells in a blood sample.

**3A60.1**

**Hereditary pure red cell aplasia**

A condition caused by determinates arising during the antenatal period, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurring in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of decreased red blood cell count in a blood sample.

**3A60.Z**

**Congenital pure red cell aplasia, unspecified**

**3A61**

**Acquired pure red cell aplasia**

A condition characterised by the near absence of red blood cell precursors in bone marrow, often associated with thymomas and autoimmune disorders

**Exclusions:**      Aplastic anaemia with paroxysmal nocturnal haemoglobinuria (3A70.1)

**3A61.0**

**Acute acquired pure red cell aplasia**

This refers to transient (acute) and acquired type of anaemia affecting the precursors to red blood cells but not to white blood cells. In PRCA, the bone marrow ceases to produce red blood cells.

**3A61.1**

**Chronic acquired pure red cell aplasia**

This refers to a chronic and acquired type of anaemia affecting the precursors to red blood cells but not to white blood cells. In PRCA, the bone marrow ceases to produce red blood cells.

**3A61.Y**

**Other specified acquired pure red cell aplasia**

**3A61.Z**

**Acquired pure red cell aplasia, unspecified**

**3A6Z**

**Pure red cell aplasia, unspecified**

**3A70**

**Aplastic anaemia**

A disease caused by determinants arising after birth, in the antenatal period or genetically inherited factors leading to the inability of stem cells to generate new mature cells. This disease is characterised by low levels of red blood cells, white blood cells, and platelets. This disease may present with pallor, fatigue, dizziness, increased risk of infection or increased bruising or bleeding.

**Inclusions:** Medullary hypoplasia  
Panmyelophthisis

**3A70.0**

**Congenital aplastic anaemia**

A disease caused by determinants in the antenatal period leading to the inability of stem cells to generate new mature cells. This disease is characterised by low levels of red blood cells, white blood cells, platelets. This disease may present with pallor, fatigue, dizziness, increased risk of infection or increased bruising or bleeding.

**Inclusions:** familial hypoplastic anaemia  
Constitutional medullar aplasia

**Exclusions:** Congenital amegakaryocytic thrombocytopenia (3B64.01)

**Coded Elsewhere:** Congenital hypoplastic anaemia (KA8C)  
Noonan syndrome (LD2F.15)

**3A70.1**

**Acquired aplastic anaemias**

A condition occurring secondary to other disorders or via an auto-immune response directed to the bone marrow arising after birth. This disease is characterised by an almost complete absence of hematopoietic stem cells resulting in low levels of red and white blood cells and platelets. This condition may present with fatigue, chronic infections, dizziness, weakness, headaches, and episodes of bleeding, usually in the skin and mucous membranes.

**Inclusions:** Acquired medullar aplasia

**Coded Elsewhere:** Paroxysmal nocturnal haemoglobinuria (3A21.0)  
Myelofibrosis with myeloid metaplasia (2A20.2)

**3A70.10**

Drug-induced aplastic anaemia

A disease caused by drug intake. This disease is characterised by inability of stem cells to generate new mature cells leading to low levels of red blood cells, white blood cells, platelets. This disease may present with pallor, fatigue, dizziness, increased risk of infection or increased bruising/bleeding.

**3A70.11**

Aplastic anaemia due to other external agents

**3A70.12**

Idiopathic aplastic anaemia

**3A70.1Y**

Other specified acquired aplastic anaemias

**3A70.1Z**

Acquired aplastic anaemias, unspecified

**3A70.Z**

**Aplastic anaemia, unspecified**

**3A71****Anaemia due to chronic disease**

A disease caused by chronic diseases such as chronic infection. This disease is characterised by inflammatory responses targeted at red blood cells leading to low levels of red blood cells in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of red blood cells in a blood sample.

**Coding Note:** Code also the causing condition

**3A71.0****Anaemia in neoplastic disease**

A disease caused by chronic neoplastic diseases. This disease is characterised by inflammatory responses targeted at red blood cell leading to low levels of red blood cells in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of red blood cells in a blood sample

**Coding Note:** Code also the causing condition

**3A71.1****Anaemia in chronic infectious diseases**

A disease caused by chronic infectious diseases leading to decreased levels of red blood cells in the blood. This disease is characterised by a low red blood cell count in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

**Coding Note:** Code also the causing condition

**3A71.2****Anaemia in chronic kidney disease**

A disease caused by chronic kidney disease. This disease is characterised by a low red blood cell count in the blood. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of a low red blood cell count in a blood sample.

**Coding Note:** Code also the causing condition

**3A71.Y****Anaemia due to other specified chronic disease**

**Coding Note:** Code also the causing condition

**3A71.Z****Anaemia due to chronic disease, unspecified****3A72****Sideroblastic anaemia**

Sideroblastic anaemias are a group of disorders in which haemoglobin is insufficiently synthesized, because of defective use of iron (although plasmatic iron levels may be normal or elevated). They are said to be sideroblastic because of the presence of ringed sideroblasts in the blood due to accumulated ferritin in mitochondria. Anaemias may be microcytic hypochromic (in thalassemia and hereditary sideroblastic anaemias), or macrocytic (in idiopathic acquired sideroblastic anaemias).

<b>3A72.0</b>	<b>Congenital sideroblastic anaemias</b>
	A disease caused by determinants arising in the antenatal period leading to the production of ringed sideroblasts; abnormal nucleated erythroblasts. This disease is characterised by the inability to incorporate haemoglobin, which red blood cells need to transport oxygen efficiently. This disease may present with pallor, fatigue, dizziness, and enlarged spleen and liver, heart disease, liver damage, or kidney failure.
<b>3A72.00</b>	Hereditary sideroblastic anaemias
	<b>Inclusions:</b> Sex-linked hypochromic sideroblastic anaemia
<b>3A72.01</b>	Hereditary syndromic sideroblastic anaemia
	<b>Coded Elsewhere:</b> Thiamine-responsive megaloblastic anaemia syndrome (5C63.Y)
<b>3A72.0Y</b>	Other specified congenital sideroblastic anaemias
<b>3A72.0Z</b>	Congenital sideroblastic anaemias, unspecified
<b>3A72.1</b>	<b>Acquired sideroblastic anaemias</b>
	A disease caused by determinants arising after birth such as myelodysplastic syndromes, antimicrobials, pyridoxine deficiency, lead poisoning, or copper deficiency. Zinc can indirectly cause sideroblastic anaemia by decreasing absorption and increasing excretion of copper. This disease is characterised by the inability to incorporate haemoglobin, which red blood cells need to transport oxygen efficiently. This disease may present with pallor, fatigue, dizziness, and enlarged spleen and liver, heart disease, liver damage, or kidney failure.
	<b>Coded Elsewhere:</b> Refractory anaemia with ring sideroblasts (2A33)
<b>3A72.Z</b>	Sideroblastic anaemia, unspecified
<b>3A73</b>	<b>Congenital dyserythropoietic anaemia</b>
	Congenital dyserythropoietic anaemias (CDA) result from diverse erythropoietic disorders; they lead to the defective production of red blood cells (RBC) and often mild haemolysis that attests to a qualitative defect of these RBC released into the circulation. Three forms of CDA have been characterised: types I, II and III. The shared symptoms include anaemia of variable severity, intermittent jaundice, splenomegaly and hepatomegaly.
	<b>Exclusions:</b> Blackfan-Diamond syndrome (3A60.1) Di Guglielmo disease (2A60.35)

Polycythaemia (3A80-3A8Z)

**Coded Elsewhere:** Polycythaemia vera (2A20.4)

Polycythaemia neonatorum (KA8A)

3A80

### **Congenital polycythaemia**

A disease caused by determinants occurring in the antenatal period leading to changes in the concentration of red blood cells. This disease is characterised by having a high concentration of red blood cells in the body leading to slow flow of blood. This disease may present with headaches, blurred vision, red skin, tiredness, high blood pressure, dizziness, periods of confusion, bleeding problems, gout or itchy skin. Confirmation is by identification of increased levels of red blood cells in a blood sample.

**Coded Elsewhere:** Polycythaemia neonatorum (KA8A)

3A80.0

### **Primary inherited erythrocytosis**

A disease caused by genetically inherited factors leading to changes in the concentration of red blood cells. This disease is characterised by having a high concentration of red blood cells in the body leading to slow flow of blood. Confirmation is by identification of mutations by genetic testing.

3A80.Y

### **Other specified congenital polycythaemia**

3A80.Z

### **Congenital polycythaemia, unspecified**

3A81

### **Acquired polycythaemia**

Secondary polycythaemia is acquired and caused by either natural or artificial increases in the production of erythropoietin, hence an increased production of erythrocytes.

3A81.0

### **Polycythaemia due to hypoxia, including high altitude**

3A81.1

### **Polycythaemia due to over-transfusion or blood doping**

3A81.2

### **Relative polycythaemia**

A disease caused by loss of body fluids leading to apparent increased levels of red blood cells in the blood. This disease may present with headache, vertigo, abnormally enlarged spleen or liver, high blood pressure, or formation of blood clots. Confirmation is by identification of relative blood cell counts in a blood sample.

3A81.Y

### **Other specified acquired polycythaemia**

3A81.Z

### **Acquired polycythaemia, unspecified**

3A8Z

### **Polycythaemia, unspecified**

3A90

### **Anaemia due to acute disease**

**Exclusions:** Acute posthaemorrhagic anaemia (3A94)

**3A91****Congenital methaemoglobinaemia**

A disease caused by determinants in the antenatal period leading to lack of the enzyme cytochrome b5 reductase. This disease is characterised by elevated levels of methemoglobin within the blood leading to haemoglobin ineffectively releasing oxygen to body tissues. This disease may present with shortness of breath, cyanosis, headache, fatigue, exercise intolerance, dizziness and loss of consciousness. Confirmation is by identification of mutation by genetic testing.

**3A92****Hereditary methaemoglobinaemia**

Hereditary methemoglobinemia (HM) is a rare red cell disorder classified principally into two clinical phenotypes: autosomal recessive congenital (or hereditary) methemoglobinemia types I and II (RCM/RHM type 1; RCM/RHM type 2). In RCM type 1, well-tolerated cyanosis from birth is the only symptom. RCM type 2, with global loss of Cb5R function, is much more severe; the cyanosis is accompanied by neurological dysfunction (with intellectual deficit, microcephaly, growth retardation, opisthotonus, strabismus and hypertonia), which usually becomes evident during the first four months of life.

**3A93****Acquired methaemoglobinaemia****3A94****Acute posthaemorrhagic anaemia**

A disease caused by blood loss such as subsequent to trauma. This disease is characterised by loss of blood from the body leading to low levels of red blood cells/blood in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of red blood cells in a blood sample.

***Exclusions:***

congenital anaemia from fetal blood loss (KA8C)

Anaemia due to acute disease (3A90)

**3A9Y****Other specified anaemias or erythrocyte disorders****3A9Z****Anaemias or other erythrocyte disorders, unspecified**

## Coagulation defects, purpura or other haemorrhagic or related conditions (3B10-3B6Z)

A condition caused by determinants arising during the antenatal period, after birth or by genetically inherited factors, leading to coagulation defects. This condition is characterised by increased bruising and bleeding.

**Exclusions:** Postpartum coagulation defects (JA43.3)

### Coagulation defects (3B10-3B4Z)

## Congenital or constitutional haemorrhagic condition (3B10-3B1Z)

A condition caused by determinants arising during the antenatal period or genetically inherited factors, leading to defects in clotting mechanisms or abnormalities causing structural flaws in the blood vessels. This disease is characterised by spontaneous bleeding or bruising.

**Coded Elsewhere:** Congenital non-inherited haemorrhagic condition

**3B10**

### Hereditary factor VIII deficiency

A disease caused by a genetically inherited mutation leading to a deficiency in clotting due to lack of factor VIII. This disease is characterised by increasing haemorrhaging and bruising. Confirmation is by identification of mutations by genetic testing.

**3B10.0**

### Haemophilia A

Haemophilia A is the most common form of haemophilia characterised by spontaneous or prolonged haemorrhages due to factor VIII deficiency. Depending on the extent of the factor VIII deficiency, it can be severe (biological activity of factor VIII below 1%), moderately severe (activity of factor VIII between 1% and 5%), or mild (activity of factor VIII between 5 and 40%).

**Exclusions:** factor VIII deficiency with vascular defect (3B12)

**3B10.1**

### Hereditary factor VIII deficiency with anti-factor VIII inhibitor

A disease caused by a genetically inherited mutation leading to a deficiency in clotting due to lack of factor VIII. This disease also causes anti-factor VIII inhibitor antibodies to be produced when receiving transfusions. Anti-factor VIII inhibitor antibodies develop as the body recognises the factor VIII as foreign, therefore deeming factor VIII infusions ineffective. This disease is characterised by increasing haemorrhaging and bruising. Confirmation is by identification of mutations by genetic testing.

**3B10.Y**

### Other specified hereditary factor VIII deficiency

**3B10.Z**

### Hereditary factor VIII deficiency, unspecified

**3B11**

### Hereditary factor IX deficiency

A disease caused by a genetically inherited X-linked recessive trait leading to a defective gene located on the X chromosome. This disease is characterised by low levels of the protein factor IX in the body leading to increased haemorrhaging and bruising due to clotting abnormalities. Confirmation is by identification of recessive trait by genetic testing.

<b>3B11.0</b>	<b>Haemophilia B</b> Haemophilia B is a form of haemophilia characterised by spontaneous or prolonged haemorrhages due to factor IX deficiency. Depending on the extent of the factor IX deficiency, it can be severe (biological activity of factor IX below 1%), moderately severe (activity of factor IX between 1% and 5%), or mild (activity of factor IX between 5 and 40%).
	<b>Inclusions:</b> PTC - [plasma thromboplastin component] deficiency
<b>3B11.Y</b>	<b>Other specified hereditary factor IX deficiency</b>
<b>3B11.Z</b>	<b>Hereditary factor IX deficiency, unspecified</b>
<b>3B12</b>	<b>Von Willebrand disease</b> A disease caused by inherited genetic mutations. This disease is characterised by quantitative, structural or function abnormalities of von Willebrand factor leading to abnormalities in coagulation of the blood. This disease may present with prolonged bleeding, easy bruising or bleeding gums. Confirmation is by identification of mutation through genetic testing.
	<b>Inclusions:</b> Factor VIII deficiency with vascular defect Vascular haemophilia Angiohaemophilia
	<b>Exclusions:</b> factor VIII deficiency with functional defect (3B10) factor VIII deficiency NOS (3B10) Acquired von Willebrand disease or syndrome (3B20-3B2Y)
<b>3B13</b>	<b>Haemophilia C</b> A disease caused by genetically inherited mutations. This disease is characterised by decreased levels of factor XI leading to abnormalities in coagulation of the blood. This disease may present with prolonged bleeding, easy bruising or bleeding gums. Confirmation is by identification of mutation through genetic testing.
<b>3B14</b>	<b>Other inherited coagulation factor deficiency with bleeding tendency</b> Any disease caused by genetically inherited mutations leading to lack of coagulation factors in the blood not elsewhere classified. These diseases are characterised by increased haemorrhaging and bruising as the blood cannot clot properly to control bleeding. Confirmation is identification of mutations by genetic testing.
<b>3B14.0</b>	<b>Hereditary deficiency of factor I</b> Congenital deficiencies of fibrinogen are coagulation disorders characterised by bleeding symptoms ranging from mild to severe resulting from reduced quantity and/or quality of circulating fibrinogen. Afibrinogenaemia (complete absence of fibrinogen) and hypofibrinogenaemia (reduced plasma fibrinogen concentration) correspond to quantitative anomalies of fibrinogen while dysfibrinogenaemia corresponds to a functional anomaly of fibrinogen. Hypo- and dysfibrinogenaemia may be frequently combined (hypodysfibrinogenaemia).

- 3B14.1      Hereditary factor X deficiency**  
Congenital factor X deficiency is an inherited bleeding disorder with a decreased antigen and/or activity of factor X (FX) and characterised by mild to severe bleeding symptoms.
- 3B14.2      Combined deficiency of vitamin K-dependent clotting factors**  
Hereditary combined vitamin K-dependent clotting factors deficiency (VKCFD) is a congenital bleeding disorder resulting from variably decreased levels of coagulation factors II, VII, IX and X, as well as natural anticoagulants protein C, protein S and protein Z.
- 3B14.Z      Other inherited coagulation factor deficiency with bleeding tendency, unspecified**
- 3B15      Inherited coagulation factor deficiency without bleeding tendency**  
A disease caused by a genetically inherited mutation leading to decreased levels of coagulation factor. This disease is characterised by decreased levels of coagulation factor without leading to increased haemorrhaging. Confirmation is by identification of decreased levels of coagulation factor in a blood sample.
- 3B1Z      Congenital or constitutional haemorrhagic condition, unspecified**

## Haemorrhagic diseases due to acquired coagulation factor defects (3B20-3B2Y)

Any disease caused by determinants arising after birth. These diseases are characterised by abnormal coagulation of the blood.

**Exclusions:**      vitamin K deficiency of newborn (KA8F.0)

**3B20      Disseminated intravascular coagulation**

A disorder that is characterised by the systemic intravascular activation of the coagulation system, simultaneously leading to intravascular thrombi, compromising an adequate blood supply to the organs, and to bleeding as the consequence of consumption of platelets and coagulation factors. It may be provoked by a wide range of disorders including infections, inflammatory disorders and malignancy.

**Coded Elsewhere:** Disseminated intravascular coagulation of fetus or newborn (KA88)

**3B21      Haemorrhagic disorder due to circulating anticoagulants and coagulation factors**

A disease caused by anticoagulants present in the body that prevent the blood from clotting normally. This disease is characterised by abnormalities in blood clotting. This disease may present with prolonged bleeding, easy bruising or bleeding gums. Confirmation is by identification of anticoagulants present in a blood sample.

**Exclusions:**      long-term use of anticoagulants without haemorrhage (QC48.0)

- 3B21.0** **Haemorrhage due to thrombin inhibitor other than heparin**  
A disease caused by any thrombin inhibitors other than heparin that affects normal coagulation of the blood. This disease is characterised by inability of the blood to coagulate leading to bleeding. Confirmation is by identification of thrombin inhibitors in a blood sample.
- 3B21.1** **Haemorrhage due to factor Xa inhibitor**  
A disease caused by factor Xa inhibitor that affects normal coagulation of the blood. This disease is characterised by inability of the blood to coagulate leading to bleeding. Confirmation is by identification of factor Xa inhibitor in a blood sample.
- 3B21.Y** **Haemorrhagic disorder due to other specified circulating anticoagulants**
- 3B21.Z** **Haemorrhagic disorder due to unspecified circulating anticoagulants**
- 3B22** **Acquired haemophilia**  
Acquired haemophilia is a rare haemorrhagic disease caused by production of anti-factor VIII antibodies and is sometimes associated with other autoimmune disorders, cancers, lymphoproliferative syndromes and multiple transfusions during the postpartum period.
- 3B2Y** **Other specified haemorrhagic diseases due to acquired coagulation factor defects**
- 3B4Z** **Coagulation defects, unspecified**

#### Fibrinolytic defects (3B50-3B51)

A disease caused by determinants arising during the antenatal period, after birth or genetically inherited factors, affecting the fibrinolysis system which prevents blood clots from growing and becoming problematic. This disease is characterised by defects in the fibrinolysis system leading to coagulation of the blood. This disease may present with thrombosis.

- 3B50** **Inherited fibrinolytic defects**  
A disease caused by genetically inherited mutations affecting the fibrinolysis system which prevents blood clots from growing and becoming problematic. This disease is characterised by defects in the fibrinolysis system leading to coagulation of the blood. This disease may present with thrombosis.  
*Coded Elsewhere:* Hypoplasminogenaemia (DA0D.3)
- 3B50.0** **Congenital alpha-2 antiplasmin deficiency**
- 3B50.1** **Congenital plasminogen activator inhibitor type 1 deficiency**  
Congenital plasminogen activator inhibitor type 1 (PAI-1) deficiency is a disorder that causes premature lysis of haemostatic clots and a moderate bleeding syndrome. Spontaneous bleeding is rarely observed, whereas moderate haemorrhages of the knees, elbows, nose and gingiva are usually triggered by mild trauma. However, menstrual bleeding may be severe and a prolonged bleeding after surgery is common. The PAI-1 deficiency may be qualitative or quantitative, total or partial.

**3B50.Y Other specified inherited fibrinolytic defects**

**3B50.Z Inherited fibrinolytic defects, unspecified**

**3B51 Acquired fibrinolytic defects**

A disease caused by determinants arising after birth, affecting the fibrinolysis system which prevents blood clots from growing and becoming problematic. This disease is characterised by defects in the fibrinolysis system leading to coagulation of the blood. This disease may present with thrombosis.

**3B60 Non-thrombocytopenic purpura**

A descriptive term for purpura caused by determinants other than low platelet count. This should be used for coding only when a more precise diagnosis is not available.

**Exclusions:** Antineutrophil cytoplasmic antibody-associated vasculitis (4A44.A)  
Antiphospholipid syndrome (4A45)  
Drug-associated immune complex vasculitis (4A85.03)  
Immune complex small vessel vasculitis (4A44.9)  
Leukocytoclastic vasculitis (4A44.B)  
Purpura or bruising due to vascular fragility (EE40.32)  
Thrombotic thrombocytopenic purpura (3B64.14)  
Traumatic purpura (EF31)

**3B60.0 Hereditary vascular purpura**

**3B60.1 Acquired vascular purpura**

Purpura resulting from vascular factors rather than from abnormalities in the blood such as dysproteinemias and disorders of platelets and coagulation.

**Exclusions:** Antineutrophil cytoplasmic antibody-associated vasculitis (4A44.A)  
Antiphospholipid syndrome (4A45)  
Capillaritis (EF40.0)  
Drug-associated immune complex vasculitis (4A85.03)  
IgA vasculitis (4A44.92)  
Leukocytoclastic vasculitis (4A44.B)  
Purpura or bruising due to vascular fragility (EE40.32)  
Thrombotic thrombocytopenic purpura (3B64.14)  
Traumatic purpura (EF31)

**3B61 Thrombophilia**

A disease caused by determinants arising after birth or genetically inherited factors leading to abnormalities in blood. This disease is characterised by abnormality of blood coagulation that increases the risk of thrombosis, clots in blood vessels. This disease may present with deep vein thrombosis or pulmonary embolism. Confirmation is identification of abnormal blood coagulation in a blood sample.

<b>3B61.0</b>	<b>Hereditary thrombophilia</b> A disease caused by hereditary factors leading to abnormalities in blood. This disease is characterised by abnormality of blood coagulation that increases the risk of thrombosis, clots in blood vessels. This disease may present with deep vein thrombosis or pulmonary embolism. Confirmation is identification of abnormal blood coagulation in a blood sample.
<b>3B61.00</b>	<b>Hyperhomocysteinaemia</b> A disease caused by deficiencies of vitamin B6, folic acid, or vitamin B12. Genetic defects in 5-MTHF reductase can consequently lead to hyperhomocysteinaemia. This disease is characterised by abnormally high level of homocysteine in the blood. This disease may present with cardiovascular disease, thrombosis, schizophrenia and osteoporosis. Confirmation is by identification of deficiency in a blood sample.
<b>3B61.0Y</b>	<b>Other specified hereditary thrombophilia</b>
<b>3B61.0Z</b>	<b>Hereditary thrombophilia, unspecified</b>
<b>3B61.1</b>	<b>Acquired thrombophilia</b> A disease caused by determinants arising after birth. This disease is characterised by abnormality of blood coagulation that increases the risk of thrombosis, clots in blood vessels. This disease may present with deep vein thrombosis or pulmonary embolism. Confirmation is identification of abnormal blood coagulation in a blood sample.  <b>Coded Elsewhere:</b> Antiphospholipid syndrome (4A45)
<b>3B61.Y</b>	<b>Other specified thrombophilia</b>
<b>3B61.Z</b>	<b>Thrombophilia, unspecified</b>
<b>3B62</b>	<b>Qualitative platelet defects</b> A disease caused by determinants arising after birth, during the antenatal period or genetically inherited factors. This disease is characterised by abnormalities in coagulation of the blood due to defective platelets. This condition may present with easy bruising, prolonged bleeding or bleeding gums. Confirmation is by identification of decreased platelets in a blood sample.  <b>Inclusions:</b> Thrombocytopathy <b>Exclusions:</b> Von Willebrand disease (3B12)
<b>3B62.0</b>	<b>Inherited qualitative platelet defects</b> A disease caused by genetically inherited mutations leading to abnormalities in platelets. This disease is characterised by abnormal platelet formation or function. Confirmation is by identification of mutations by genetic testing.  <b>Coded Elsewhere:</b> Dense granule disease (3B62.3) Alpha-delta dense granule deficiency (3B62.4)

- 3B62.00** Alpha-granule diseases  
A condition caused by determinants arising after birth, in the antenatal period. This condition is characterised by defects in the alpha granules in platelets leading to abnormalities in coagulation mechanisms. This condition may present with prolonged bleeding, epistaxis, menorrhagia, easy bruising, anaemia, fatigue or shortness of breath. Confirmation is by identification of platelet defects in a blood sample.
- 3B62.01** Inherited giant platelet disorder  
A disease caused by genetically inherited mutations. This disease is characterised by abnormally large platelets, low platelet count and a bleeding tendency. Confirmation is by identification of mutations through genetic testing.  
**Coded Elsewhere:** MYH9 macrothrombocytopenia syndromes (3B64.01)
- 3B62.0Y** Other specified inherited qualitative platelet defects
- 3B62.0Z** Inherited qualitative platelet defects, unspecified
- 3B62.1** **Bleeding diathesis due to thromboxane synthesis deficiency**  
A disease caused by thromboxane synthesis deficiency. This disease is characterised by low levels of eicosanoids (lipids), abnormalities in coagulation leading to haemorrhaging. Confirmation is by identification of low levels of eicosanoids in a blood sample.
- 3B62.2** **Isolated thrombocytopenia**
- 3B62.3** **Dense granule disease**  
A condition caused by determinants arising after birth, in the antenatal period. This condition is characterised by defects in the dense granules in platelets leading to abnormalities in coagulation mechanisms. This condition may present with prolonged bleeding, epistaxis, menorrhagia, easy bruising, anaemia, fatigue or shortness of breath. Confirmation is by identification of platelet defects in a blood sample.  
**Coded Elsewhere:** Hermansky-Pudlak syndrome (EC23.20)  
Chédiak-Higashi syndrome (EC23.20)
- 3B62.4** **Alpha-delta dense granule deficiency**  
A condition caused by determinants arising after birth, in the antenatal period. This condition is characterised by defects in the alpha delta dense granules in platelets, leading to abnormalities in coagulation mechanisms. This condition may present with prolonged bleeding, epistaxis, menorrhagia, easy bruising, anaemia, fatigue or shortness of breath. Confirmation is by identification of low levels of alpha delta dense granules in a blood sample.
- 3B62.5** **Haemophagocytic syndrome associated with infection**  
This is an uncommon hematologic disorder that, typically, clinically manifests as fever, hepatosplenomegaly, lymphadenopathy, jaundice and rash, with laboratory findings of histiocytosis, and the pathologic finding of haemophagocytosis, infection-associated.
- 3B62.Y** **Other specified qualitative platelet defects**

3B62.Z	<b>Qualitative platelet defects, unspecified</b>
3B63	<b>Thrombocytosis</b> A disease caused by essential thrombocytosis or other myelo-proliferative disorders such as chronic myelogenous leukaemia, polycythaemia, myelofibrosis. This disease can also have secondary causes such as inflammation, surgery, hypoplasia, splenectomy, asplenia, iron deficiency anaemia or haemorrhage. This disease is characterised by elevated platelet count in the blood. Confirmation is by identification of increased platelet count in a blood sample.
3B63.0	<b>Congenital thrombocytosis</b> Familial thrombocytosis is a type of thrombocytosis, a sustained elevation of platelet numbers, which affects the platelet/megakaryocyte lineage and may create a tendency for thrombosis and haemorrhage but does not cause myeloproliferation.  <b>Inclusions:</b> Hereditary thrombocytosis <b>Exclusions:</b> Essential thrombocythaemia (3B63.1)
3B63.1	<b>Acquired thrombocytosis</b> A chronic myeloproliferative neoplasm that involves primarily the megakaryocytic lineage. It is characterised by sustained thrombocytosis in the blood, increased numbers of large, mature megakaryocytes in the bone marrow, and episodes of thrombosis and/or haemorrhage. Progression to a post essential thrombocythaemia myelofibrosis stage or transformation to acute myeloid leukaemia is rarely observed.  <b>Inclusions:</b> Idiopathic haemorrhagic thrombocythaemia
3B63.10	Secondary thrombocytosis
<b>Coding Note:</b>	Code also the causing condition
3B63.1Y	Other specified acquired thrombocytosis
3B63.1Z	Acquired thrombocytosis, unspecified
3B63.Y	<b>Other specified thrombocytosis</b>
3B63.Z	<b>Thrombocytosis, unspecified</b>
3B64	<b>Thrombocytopenia</b> This disease is characterised by decreased levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelet count in a blood sample.  <b>Coded Elsewhere:</b> Isolated thrombocytopenia (3B62.2)
3B64.0	<b>Congenital thrombocytopenia</b> A disease caused by determinants arising during the antenatal period leading to low platelet count. This disease is characterised by decreased levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of a decreased platelet count in a blood sample.

<b>3B64.00</b>	Congenital non-inherited thrombocytopenia  <b>Coded Elsewhere:</b> Transient neonatal thrombocytopaenia (KA89)
<b>3B64.01</b>	Hereditary thrombocytopenia A disease caused by a genetically inherited mutation leading to decreased platelet count. This disease is characterised by decreased levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelet count in a blood sample.  <b>Coded Elsewhere:</b> Thrombocytopaenia - absent radius (LD2F.1Y)  Familial platelet syndrome with predisposition to acute myelogenous leukaemia (3B62.3)  Congenital thrombotic thrombocytopenic purpura due to ADAMTS-13 deficiency (3B64.14)  Macrothrombocytopenia with mitral valve insufficiency (3B62.01)
<b>3B64.0Z</b>	Congenital thrombocytopenia, unspecified
<b>3B64.1</b>	<b>Acquired thrombocytopenia</b> A disease caused by determinants arising after birth, leading to low platelet count. This disease is characterised by low levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelet count in a blood sample.
<b>3B64.10</b>	Immune thrombocytopenic purpura Immune thrombocytopenic purpura (or immune thrombocytopenia; ITP) is an autoimmune coagulation disorder characterised by isolated thrombocytopenia (a platelet count <100,000/microL), in the absence of any underlying disorder that may be associated with thrombocytopenia.  <b>Coded Elsewhere:</b> Evans syndrome (3A20.5)
<b>3B64.11</b>	Secondary thrombocytopenic purpura This disease is characterised by a relative decrease in levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelets in a blood sample.
<b>Coding Note:</b>	Code also the causing condition
<b>3B64.12</b>	Drug-induced thrombocytopenic purpura Thrombocytopenic purpura attributable to drug toxicity (e.g. cytotoxic chemotherapeutic or immunosuppressive agents) or to an idiosyncratic drug-associated allergic thrombocytopenia (e.g. quinine, thiazides).
<b>3B64.13</b>	Alloimmune thrombocytopenia A disease caused by determinants such as a blood transfusion that lead to an immune response to the foreign antigens. This disease is characterised by low levels of platelets in the body due to an immune reactive response to the foreign platelet antigens. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelet count and presence of autoantibodies in a blood sample.

<b>3B64.14</b>	Thrombotic thrombocytopenic purpura This condition is idiopathic. This condition is characterised by abnormality of blood coagulation causing extensive microscopic clots to form in the small blood vessels throughout the body resulting in low platelet count. This condition may present with seizures, hemiplegia, paresthesias, visual disturbance, and aphasia or anaemia. Confirmation is by identification of thromboses.
<b>3B64.1Y</b>	Other specified acquired thrombocytopenia
<b>3B64.Z</b>	<b>Thrombocytopenia, unspecified</b>
<b>3B65</b>	<p><b>Thrombotic microangiopathy, not elsewhere classified</b></p> <p>Thrombotic microangiopathies are microvascular occlusive disorders characterised by systemic or intrarenal aggregation of platelets, thrombocytopenia, and mechanical injury to erythrocytes. Thrombotic thrombocytopenic purpura (TTP) and haemolytic–uremic syndrome (HUS) represent a spectrum of thrombotic microangiopathies. In TTP, systemic microvascular aggregation of platelets causes ischemia in the brain and other organs. In HUS, platelet–fibrin thrombi predominantly occlude the renal circulation.</p> <p><b>Coded Elsewhere:</b> Thrombotic thrombocytopenic purpura (3B64.14)</p> <ul style="list-style-type: none"> <li>Haemolytic uraemic syndrome (3A21.2)</li> <li>Methylcobalamin deficiency type cbl G (5C50.B)</li> <li>Hereditary haemolytic uraemic syndrome (3A10.Y)</li> </ul>
<b>3B6Y</b>	<b>Other specified coagulation defects, purpura or other haemorrhagic or related conditions</b>
<b>3B6Z</b>	<b>Coagulation defects, purpura or other haemorrhagic or related conditions, unspecified</b>

## Diseases of spleen (3B80-3B8Z)

<b>3B80</b>	<b>Congenital disorders of spleen</b> Any condition caused by a failure of the spleen to correctly develop in the antenatal period.  <b>Coded Elsewhere:</b> Structural developmental anomalies of spleen (LB22)
<b>3B80.0</b>	<b>Splenomegaly in storage diseases</b> A disease caused by storage diseases; genetically inherited metabolic disorders that result from defects in lysosomal, lipid or glycogen function, of the spleen. This disease is characterised by enlargement of the spleen. This disease may present with abdominal pain, chest pain, pallor, shortness of breath fatigue. Confirmation is through medical imaging.

**3B81**

**Acquired disorders of spleen**

Any condition caused by determinants acquired after birth, leading to dysfunction of the spleen.

**Coded Elsewhere:** Injury of spleen (NB91.0)

Malignant neoplasms of the spleen (2C11.Z)

**3B81.0**

**Tumour-like conditions of spleen**

Any condition caused by determinants acquired after birth, in the antenatal period or genetically inherited factors, leading to tumour-like conditions of the spleen. Confirmation is through medical imaging.

**3B81.1**

**Postsurgical asplenia**

A disease caused by underlying diseases, splenectomy or splenic rupture from trauma. This disease is characterised by absence of normal spleen function. This disease may present with increased susceptibility to infection. Confirmation is through medical imaging.

**3B81.2**

**Atrophy of spleen**

A disease caused by determinants arising after birth, during the antenatal period or by genetically inherited factors. This disease is characterised by partial or complete degradation of the spleen. This disease may present with increased susceptibility to infection. Confirmation is through medical imaging.

**3B81.3**

**Nontraumatic laceration or rupture of spleen**

A disease caused by non-traumatic determinants such as infectious diseases, medical procedures such as colonoscopy, haematological diseases, medications, or pregnancy. This disease is characterised by laceration or rupturing of the spleen leading to lack of function. This disease may present with bleeding and increased susceptibility of infection. Confirmation is through medical imaging.

**3B81.4**

**Splenosis**

A disease caused by determinants arising after birth such as physical trauma or splenectomy . This disease is characterised by autoimplantation of one or more focal deposits of splenic tissue in various compartments of the body. Confirmation is through medical imaging.

**3B81.5**

**Splenic cyst or pseudocyst**

**3B81.50**

**Pseudocyst of spleen**

A disease caused by determinants arising after birth, during the antenatal period or by genetically inherited factors. This disease is characterised by a noncancerous fluid-filled sac, pseudocysts are like cysts, but lack epithelial or endothelial cells. This disease is often asymptomatic but may present with abdominal pain, nausea and vomiting. Confirmation is through medical imaging.

**3B81.51**

**Epithelial cyst of spleen**

**3B81.5Y**

**Other specified splenic cyst**

**3B81.5Z**

**Splenic cyst, unspecified**

<b>3B81.6</b>	<b>Infarction of spleen</b> A disease caused by determinants such as trauma, infection, or inherited factors leading to a shortage of oxygen in the spleen. This disease is characterised by death of spleen tissue and loss of function. Confirmation is by medical imaging.  <b>Exclusions:</b> traumatic rupture of spleen (NB91.0) <b>Coded Elsewhere:</b> Neonatal haemorrhage originating in spleen (KA83.5)
<b>3B81.7</b>	<b>Infection of spleen</b> Any condition of the spleen, caused by an infection with a bacterial, viral, fungal, or parasitic source.
<b>3B81.70</b>	Acute septic splenitis  <b>Inclusions:</b> septic spleen
<b>3B81.71</b>	Abscess of spleen This is a collection of pus (neutrophils) that has accumulated within a tissue because of an inflammatory process in response to either an infectious process (usually caused by bacteria or parasites) or other foreign materials (e.g., splinters, bullet wounds, or injecting needles), in the spleen.
<b>3B81.7Y</b>	Other specified infection of spleen
<b>3B81.7Z</b>	Infection of spleen, unspecified
<b>3B81.8</b>	<b>Torsion of spleen</b> A disease caused by abnormal development of splenic suspensory ligaments. This disease is characterised by twisting of the spleen leading to splenic infarction. This disease may present with abdominal pain. Confirmation is through medical imaging.
<b>3B81.9</b>	<b>Fibrosis of spleen</b> A disease caused by determinants arising after birth, during the antenatal period or by genetically inherited factors. This disease is characterised by formation of excess fibrous connective tissue leading to partial or complete degradation of the spleen. This disease may present with increased susceptibility to infection. Confirmation is through medical imaging.  <b>Coding Note:</b> Code also the causing condition
<b>3B81.A</b>	<b>Perisplenitis</b> A disease caused by bacterial or viral infection, parasite infestation, or cysts. This disease is characterised by inflammation of the peritoneal surface of the spleen. This disease may present with abdominal pain, susceptibility to infection and enlargement of the spleen. Confirmation is by identification of infection in a blood sample.

**3B81.B**      **Hypersplenism**  
A disease caused by determinants such as cirrhosis, malaria, tuberculosis or inflammatory disorders leading overactive spleen function. This disease is characterised by the presence of an enlarged spleen. Confirmation is by identification through medical imaging.

**Exclusions:**      Splenomegaly, not elsewhere classified (ME10.01)  
congenital splenomegaly (LB22)

**3B81.C**      **Chronic congestive splenomegaly**  
A form of exaggerated spleen function characterised by splenic enlargement secondary to splenic vein thrombosis and/or portal hypertension

**3B81.Y**      **Other specified acquired disorders of spleen**

**3B81.Z**      **Acquired disorders of spleen, unspecified**

**3B8Z**      **Diseases of spleen, unspecified**

---

**3C0Y**      **Other specified diseases of the blood or blood-forming organs**

**3C0Z**      **Diseases of the blood or blood-forming organs, unspecified**

# CHAPTER 04

---

## Diseases of the immune system

This chapter has 45 four-character categories.

Code range starts with 4A00

**Exclusions:** Complications of pregnancy, childbirth and the puerperium (Chapter 18)

Neoplasms (Chapter 02)

Developmental anomalies (Chapter 20)

**Coded Elsewhere:** Organ specific autoimmune disorders

Symptoms, signs or clinical findings of blood, blood-forming organs, or the immune system (MA10-MA3Y)

This chapter contains the following top level blocks:

- Primary immunodeficiencies
- Nonorgan specific systemic autoimmune disorders
- Autoinflammatory disorders
- Allergic or hypersensitivity conditions
- Immune system disorders involving white cell lineages
- Certain disorders involving the immune system
- Organ specific autoimmune disorders

### Primary immunodeficiencies (4A00-4A0Z)

#### **4A00 Primary immunodeficiencies due to disorders of innate immunity**

**Coded Elsewhere:** Constitutional neutropaenia (4B00.00)

#### **4A00.0 Functional neutrophil defects**

**Inclusions:** Congenital dysphagocytosis

**Coded Elsewhere:** Haemolytic anaemia due to glucose-6-phosphate dehydrogenase deficiency (3A10.00)

Papillon-Lefèvre syndrome (EC20.30)

#### **4A00.00 Neutrophil immunodeficiency syndrome**

Neutrophil immunodeficiency syndrome is a primary immunodeficiency characterised by neutrophilia with severe neutrophil dysfunction, leukocytosis, a predisposition to bacterial infections and poor wound healing, including an absence of pus in infected areas.

#### **4A00.0Y Other specified functional neutrophil defects**

- 4A00.0Z** Functional neutrophil defects, unspecified
- 4A00.1** **Defects in the complement system**
- Exclusions:** Atypical haemolytic uraemic syndrome (3A10)  
Paroxysmal nocturnal haemoglobinuria (3A21.0)
- 4A00.10** Immunodeficiency with an early component of complement deficiency
- 4A00.11** Immunodeficiency with a late component of complement deficiency
- 4A00.12** Immunodeficiency with factor B deficiency
- 4A00.13** Immunodeficiency with factor D anomaly  
Factor D deficiency is an autosomal recessive immunologic disorder characterised by increased susceptibility to bacterial infections, particularly *Neisseria* infections, due to a defect in the alternative complement pathway.
- 4A00.14** Hereditary angioedema  
Hereditary angioedema is caused in the majority of cases by genetically determined low absolute (type I) or functional (type II) levels of C1 inhibitor, a plasma proteinase inhibitor involved in regulation of complement activation. It is characterised clinically by recurrent subcutaneous and/or submucosal oedema and can result in life-threatening laryngeal obstruction. Involvement of the digestive tract commonly causes abdominal pain. This and the absence of accompanying urticarial weals or itch distinguish it from the common form of angioedema, which is part of the spectrum of urticaria.
- 4A00.15** Acquired angioedema  
Acquired angioedema is clinically similar to hereditary angioedema and is not associated with urticaria. It may be associated with a lymphoproliferative disorder (type I) or may be an isolated phenomenon due to an autoantibody directed against C1 inhibitor (type II).
- 4A00.1Y** Other specified defects in the complement system
- 4A00.1Z** Defects in the complement system, unspecified
- 4A00.2** **Genetic susceptibility to particular pathogens**
- Coded Elsewhere:** Encephalitis due to herpes simplex virus (1F00.21)  
Chronic mucocutaneous candidosis (1F23.14)
- 4A00.3** **Immunodeficiency with natural-killer cell deficiency**
- 4A00.Y** Other specified primary immunodeficiencies due to disorders of innate immunity
- 4A00.Z** Primary immunodeficiencies due to disorders of innate immunity, unspecified
- 4A01** **Primary immunodeficiencies due to disorders of adaptive immunity**
- 4A01.0** **Immunodeficiencies with predominantly antibody defects**  
A disorder characterised by an inability to mount a normal immune response due to antibody (i.e. immunoglobulin) defects

- 4A01.00** Hereditary agammaglobulinaemia with profoundly reduced or absent B cells  
 This refers to a hereditary type of primary immune deficiency disease characterised by a reduction in all types of gamma globulins, and rare X-linked genetic disorder that affects the body's ability to fight infection.
- 4A01.01** Immunodeficiencies with severe reduction in at least two serum immunoglobulin isotypes with normal or low numbers of B cells  
 This refers to a nonfamilial type of primary immune deficiency disease characterised by a reduction in at least two serum immunoglobulin isotypes. Circulating B cells may be normal or low.
- 4A01.02** Specific antibody deficiency with normal immunoglobulin concentrations or normal number of B cells
- 4A01.03** Transient hypogammaglobulinaemia of infancy
- 4A01.04** Immunodeficiencies with isotype or light chain deficiencies with normal number of B cells
- 4A01.05** Immunodeficiencies with severe reduction in serum IgG or IgA with normal or elevated IgM and normal numbers of B-cells  
**Coded Elsewhere:** Hyper-IgM syndrome due to CD40 ligand deficiency (4A01.1Y)  
 Hyper-IgM syndrome due to CD40 deficiency (4A01.1Y)
- 4A01.0Y** Other specified immunodeficiencies with predominantly antibody defects
- 4A01.0Z** Immunodeficiencies with predominantly antibody defects, unspecified
- 4A01.1** **Combined immunodeficiencies**  
**Exclusions:** autosomal recessive agammaglobulinaemia (Swiss type) (4A01.00)  
**Coded Elsewhere:** Laron syndrome with immunodeficiency (5A61.0)
- 4A01.10** Severe combined immunodeficiencies  
 Severe combined immunodeficiency (SCID) comprises a group of rare monogenic primary immunodeficiency disorders characterised by a lack of functional peripheral T lymphocytes resulting in early-onset severe respiratory infections and failure to thrive.
- 4A01.11** Major histocompatibility complex class I deficiency
- 4A01.12** Major histocompatibility complex class II deficiency  
 Immunodeficiency by defective expression of HLA class II is an autosomal recessive primary immune deficiency, manifesting by recurrent viral and bacterial infections, often leading to chronic diarrhoea and growth retardation.
- 4A01.1Y** Other specified combined immunodeficiencies
- 4A01.1Z** Combined immunodeficiencies, unspecified
- 4A01.2** **Diseases of immune dysregulation**

- 4A01.20** Immune dysregulation syndromes with hypopigmentation  
**Coded Elsewhere:** Hermansky-Pudlak syndrome (EC23.20)  
Chédiak-Higashi syndrome (EC23.20)  
Griselli syndrome type 2 (4A01.23)
- 4A01.21** Immune dysregulation syndromes presenting primarily with autoimmunity  
**Coded Elsewhere:** Autoimmune polyendocrinopathy type 1 (5B00)  
Syndromic multisystem autoimmune disease due to ITCH deficiency (4A43.Y)  
Aicardi-Goutières syndrome (5C55.2)  
Spondyloepiphyseal dysplasia with combined immunodeficiency (LD24.4)
- 4A01.22** Immune dysregulation syndromes presenting primarily with lymphoproliferation
- 4A01.23** Primary haemophagocytic lymphohistiocytosis  
A disease caused by determinants arising after birth, during the antenatal period or genetically inherited factors leading to uncontrolled proliferation of activated lymphocytes and macrophages. This disease is characterised by increased proliferation of morphologically benign lymphocytes and macrophages that secrete high amounts of inflammatory cytokines. This disease may present with fever, rash, jaundice, splenomegaly, lymphadenopathy, histiocytosis, haemophagocytosis, or cytopenia.  
**Inclusions:** Histiocytoses of mononuclear phagocytes  
**Coded Elsewhere:** Hermansky-Pudlak syndrome (EC23.20)  
Chédiak-Higashi syndrome (EC23.20)
- 4A01.2Y** Other specified diseases of immune dysregulation
- 4A01.2Z** Diseases of immune dysregulation, unspecified
- 4A01.3** **Other well-defined immunodeficiency syndromes due to defects in adaptive immunity**  
This refers to other defects in the highly specialized, systemic cells and processes that eliminate or prevent pathogen growth.  
**Coded Elsewhere:** Wiskott-Aldrich syndrome (3B62.0Y)  
Netherton syndrome (LD27.2)  
Dyskeratosis congenita (3A70.0)
- 4A01.30** Immunodeficiency due to defects of the thymus  
**Coded Elsewhere:** CATCH 22 phenotype (LD44.N0)
- 4A01.31** DNA repair defects other than combined T-cell or B-cell immunodeficiencies
- 4A01.32** Immuno-osseous dysplasia  
This is an autosomal recessive disorder with the diagnostic features of spondyloepiphyseal dysplasia, renal dysfunction, and T-cell immunodeficiency.  
**Coded Elsewhere:** Cartilage-hair hypoplasia (LD27.0Y)

- 4A01.33** Hepatic veno-occlusive disease - immunodeficiency syndrome  
 Hepatic veno-occlusive disease - immunodeficiency syndrome is characterised by the association of severe hypogammaglobulinemia, combined T and B cell immunodeficiency, absent lymph node germinal centres, absent tissue plasma cells and hepatic veno-occlusive disease.
- 4A01.34** Hyperimmunoglobulin E syndromes
- 4A01.Z** Primary immunodeficiencies due to disorders of adaptive immunity, unspecified
- 4A0Y** Other specified primary immunodeficiencies
- 4A0Z** Primary immunodeficiencies, unspecified
- 4A20** Acquired immunodeficiencies
- Coded Elsewhere:** Human immunodeficiency virus disease (1C60-1C62.Z)  
 Acquired neutropaenia (4B00.01)
- 4A20.0** Adult-onset immunodeficiency  
 Adults with disseminated mycobacterial infections and/or other AIDS-defining infections, often involving concomitant neutrophilic dermatoses. All patients have high titres of anti-interferon-gamma and normal CD4 T helper cell counts.
- 4A20.1** Acquired immunodeficiency due to loss of immunoglobulin  
 Acquired immunodeficiency due to loss of immunoglobulins (protein loss) may occur via the GI tract (protein losing enteropathy), via the kidney (nephrotic syndrome) or via the skin (in severe skin damage).
- 4A20.Y** Other specified acquired immunodeficiencies
- 4A20.Z** Acquired immunodeficiencies, unspecified

## Nonorgan specific systemic autoimmune disorders (4A40-4A4Z)

**Coded Elsewhere:** Rheumatoid arthritis (FA20)

- 4A40** Lupus erythematosus  
 An autoimmune non-organ specific inflammatory disease characterised by the presence of antibodies to DNA, RNA and other components of the nucleus. It has a very variable clinical presentation and course ranging from an acute fulminant life-threatening disorder with involvement of heart, central nervous system and kidneys to an indolent chronic scarring skin disorder.
- Coded Elsewhere:** Subacute cutaneous lupus erythematosus (EB50)  
 Chronic cutaneous lupus erythematosus (EB51)  
 Neonatal lupus erythematosus (KA07.0)

- 4A40.0** **Systemic lupus erythematosus**  
Systemic lupus erythematosus (SLE) is a clinically multisystem disease, which is autoimmune in origin and is characterised by the presence of autoantibodies directed against nuclear antigens. Manifestations include rash, arthritis and fatigue, nephritis, neurological problems, anaemia and thrombocytopenia at the more severe end of the spectrum.
- 4A40.00** Systemic lupus erythematosus with skin involvement  
Systemic lupus erythematosus (SLE) involving the skin. This may present with a malar "butterfly" erythema or with extensive necrolysis of sun-exposed skin, particularly on the head, neck and upper torso.  
**Coded Elsewhere:** Immunobullous systemic lupus erythematosus (EB4Y)
- 4A40.0Y** Other specified systemic lupus erythematosus
- 4A40.0Z** Systemic lupus erythematosus, unspecified
- 4A40.1** **Drug-induced lupus erythematosus**  
Drug-induced lupus erythematosus is a syndrome in which positive antinuclear antibodies are associated with symptoms, such as fever, malaise, arthritis, intense arthralgia/myalgia, serositis, and/or rash. The syndrome appears during therapy with certain medications (e.g., procainamide, hydralazine, phenytoin) and tumour necrosis factor inhibitors. It occurs predominantly in Caucasians, has less female predilection than SLE, rarely involves kidneys or brain, is rarely associated with anti-dsDNA, is commonly associated with antibodies to histones, and usually resolves over several weeks after discontinuation of the offending medication.
- 4A40.Y** Other specified lupus erythematosus
- 4A40.Z** Lupus erythematosus, unspecified
- 4A41** **Idiopathic inflammatory myopathy**  
These comprise a diverse group of syndromes that have in common persistent muscle inflammation of unknown pathophysiology, resulting in damage that affects muscle function. The inflammatory muscle disease can either be acute or chronic in nature.  
**Coded Elsewhere:** Extraocular myositis (9C82.3)
- 4A41.0** **Dermatomyositis**  
Dermatomyositis is an inflammatory myopathy, showing progressive, symmetrical muscle weakness, low muscle endurance, and cutaneous manifestations such as Gottron's papules, heliotrope rash, shawl sign, V-sign and mechanic's hand. Internal organ manifestations such as interstitial pneumonia (pneumonitis) and myocarditis sometimes develop. The skin rash may precede the muscle symptoms and may be the only clinical sign of dermatomyositis in some patients (clinically, amyopathic dermatomyositis).

<b>4A41.00</b>	Adult dermatomyositis Adult dermatomyositis is a systemic inflammatory disorder affecting the skeletal muscles, the skin, and other organs. It is characterised by symmetric proximal muscle weakness, increased serum muscle enzymes, myopathic changes upon electromyography, typical histological findings on muscle biopsy, and typical dermatologic manifestations such as heliotrope rash or Gottron's papules.
	<b>Exclusions:</b> Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)
<b>4A41.01</b>	Juvenile dermatomyositis Juvenile dermatomyositis is the early-onset form of dermatomyositis, a systemic autoimmune inflammatory muscle disorder, characterised by proximal muscle weakness, evocative skin lesion, and systemic manifestations.
<b>4A41.0Z</b>	Dermatomyositis, unspecified
<b>4A41.1</b>	<b>Polymyositis</b> Polymyositis is an inflammatory muscle disease of unknown aetiology occurring predominantly in adults and characterised clinically by proximal muscle weakness (shoulders, arms, thighs), often with associated myalgia. Involvement of pharyngeal and oesophageal muscles may result in dysphagia and a risk of aspiration pneumonia. Myocarditis with rhythm disturbances or cardiomyopathy is a rare but serious complication. Polymyositis may be associated with other autoimmune diseases, malignancy or viral infection. Although serum muscle enzyme concentrations and electromyography are usually abnormal, definitive diagnosis requires demonstration of characteristic histological changes, including muscle necrosis, muscle fibre regeneration and diffuse infiltration by CD8+ T lymphocytes, on muscle biopsy.
<b>4A41.10</b>	Juvenile polymyositis Juvenile polymyositis is a rare childhood idiopathic inflammatory myopathy. It is frequently misdiagnosed, as it lacks a unique clinical phenotype. Traditionally, it presents with weakness of the proximal muscles that evolves over weeks to months. The primary histologic features are fibre size variability, scattered necrotic and regenerating fibres, and perivascular and endomysial cellular infiltrates.
	<b>Exclusions:</b> Systemic sclerosis (4A42) Overlap or undifferentiated nonorgan specific systemic autoimmune disease (4A43) Antiphospholipid syndrome (4A45) Vasculitis (4A44) Lupus erythematosus (4A40)

<b>4A41.11</b>	Paraneoplastic polymyositis Paraneoplastic is a rare cancer associated entity. It presents sub-, or acutely with proximal weakness, often including the neck flexors, dysphagia, rarely the respiratory muscles and the heart are involved. Sometimes muscle pain or myalgia occur. Myopathology shows a targeted, cell-mediated lymphocyte toxicity against muscle fibres in focal areas of inflammation within perimysial connective tissue and surrounding blood vessels. Muscle fibres may be destroyed by cytotoxic T cells. Non-Hodgkin's lymphoma, lung, and bladder carcinoma are the most frequently observed associated cancer types.
<b>Coding Note:</b>	Code also the causing condition
<b>4A41.1Y</b>	Other specified polymyositis
<b>4A41.1Z</b>	Polymyositis, unspecified
<b>4A41.2</b>	<p><b>Inclusion body myopathy</b></p> <p>Inclusion body myopathy (IBM) is distinguished from polymyositis (PM) and dermatomyositis (DM) on the basis of clinical and histopathological features. A characteristic clinical phenotype is characterised by insidious onset of muscle weakness over months to years, muscle weakness localised predominantly in the thigh muscles and finger flexors, and resistance to glucocorticoid treatment. Typical histopathologic features include sarcoplasmic and nuclear inclusions and rimmed vacuoles.</p>
<b>4A41.20</b>	<p><b>Inflammatory inclusion body myositis</b></p> <p>Inclusion body myositis (IBM) is the most common idiopathic inflammatory myopathy after age 50. It typically presents with chronic insidious proximal leg and/or distal arm asymmetric muscle weakness leading to recurrent falls and loss of dexterity. Creatine kinase is up to 15 times elevated in IBM and needle electromyography mostly shows a chronic irritative myopathy. Muscle histopathology demonstrates endomysial inflammatory exudates surrounding and invading non-necrotic muscle fibres often times accompanied by rimmed vacuoles and protein deposits. Despite inflammatory muscle pathology, it is likely that IBM has a prominent degenerative component as supported by refractoriness to immunosuppressive therapy.</p> <p><b>Exclusions:</b>      Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)</p>
<b>4A41.21</b>	<p><b>Noninflammatory inclusion body myopathy</b></p> <p>Noninflammatory inclusion body myopathy (IBM) is an idiopathic muscle disorder without inflammatory exudates and expression of class I major histocompatibility complex. Rimmed vacuoles and "IBM-like" filaments without inflammatory cells are described in muscle biopsy.</p> <p><b>Exclusions:</b>      Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)</p>
<b>4A41.2Z</b>	Inclusion body myopathy, unspecified
<b>4A41.Y</b>	<b>Other specified idiopathic inflammatory myopathy</b>

**4A41.Z Idiopathic inflammatory myopathy, unspecified**

**4A42 Systemic sclerosis**

Systemic sclerosis is a systemic disorder of the connective tissue; manifested by hardening and thickening of the skin, by abnormalities involving the microvasculature and larger vessels, and by fibrotic degenerative changes in various body organs including the heart, lungs, kidneys, and gastrointestinal tract. (Arthritis Rheum 1980;23:581-590)

**Inclusions:** Systemic scleroderma

**Exclusions:** Circumscribed scleroderma (EB61.0)

**4A42.0 Paediatric onset systemic sclerosis**

Systemic sclerosis arising before the age of 16. Involvement of internal organs is less common but arthritis and myositis are more common than in adults.

**4A42.1 Diffuse systemic sclerosis**

Diffuse cutaneous systemic sclerosis (dcSSc) is a subtype of Systemic Sclerosis (SSc) characterised by truncal and acral skin fibrosis with an early and significant incidence of diffuse involvement (interstitial lung disease, oliguric renal failure, diffuse gastrointestinal disease, and myocardial involvement).

**4A42.2 Limited systemic sclerosis**

Combination of calcinosis, Raynaud phenomenon, oesophageal dysfunction, sclerodactyly and telangiectasia.

**4A42.Z Systemic sclerosis, unspecified**

**4A43 Overlap or undifferentiated nonorgan specific systemic autoimmune disease**

Nonorgan specific systemic autoimmune diseases which do not fulfil the diagnostic criteria for any single recognised disease entity.

**4A43.0 IgG4 related disease**

IgG4 related syndrome (IgG4-related disease: IgG4-RD) is a clinical disease characterised by elevated serum IgG4 concentration and tumefaction or tissue infiltration by IgG4-positive plasma cells. The diagnostic criteria for IgG4 related syndrome have been proposed, and it may be present in a certain population of patients with a wide variety of diseases, including Mikulicz disease, autoimmune pancreatitis, hypophysitis, Riedel thyroiditis, interstitial pneumonitis, interstitial nephritis, prostatitis, lymphadenopathy, retroperitoneal fibrosis, inflammatory aortic aneurysm, and inflammatory pseudo tumour.

**Coded Elsewhere:** Primary cutaneous plasmacytosis (EK91.2)

Benign dermal lymphocytic or lymphoplasmacytic infiltrations or proliferations (EE90-EE91)

Type 1 IgG4 related autoimmune pancreatitis (DC33)

- 4A43.1 Mikulicz disease**  
Mikulicz disease is a disorder first reported by Johann von Mikulicz in 1892 and characterised by symmetrical swelling of the lachrymal, submandibular, and parotid glands, with massive infiltration of these glands by mononuclear cells. Serum autoantibodies, such as anti-Ro/SS-A, are usually negative and serum IgG4 concentration may be increased. Unlike Sjögren disease, IgG4-Mikulicz disease is characterised by the formation of lymphoid follicles, but shows lower levels of lymphocytic infiltration into salivary ducts, such that their structure remains intact.
- 4A43.2 Sjögren syndrome**  
Sjögren syndrome is a slowly progressive, systemic inflammatory autoimmune disease affecting primarily the exocrine glands. Lymphocytic infiltrates replace functional epithelium, leading to oral and ocular dryness. Characteristic autoantibodies (e.g., anti-Ro/SS-A and/or anti-La/SS-B) are produced. The disorder can occur alone (it is then known as "primary SS") or in association with another autoimmune disease (it is then known as "secondary SS").  
**Coded Elsewhere:** Keratoconjunctivitis sicca (9A79)
- 4A43.20 Primary Sjögren syndrome**
- 4A43.21 Secondary Sjögren syndrome**  
Secondary Sjögren syndrome is a progressive inflammatory autoimmune disease affecting the exocrine glands in the presence of other systemic autoimmune diseases, such as rheumatoid arthritis, systemic lupus erythematosus, and systemic sclerosis. Lymphocytic infiltrates replace functional epithelium, leading to oral and ocular dryness.
- Coding Note:** Code also the causing condition
- 4A43.22 Paediatric onset Sjögren syndrome**
- 4A43.2Y Other specified sjögren syndrome**
- 4A43.2Z Sjögren syndrome, unspecified**
- 4A43.3 Mixed connective tissue disease**  
Mixed connective tissue disease is an overlapping syndrome combining features of systemic lupus erythematosus, systemic sclerosis, and polymyositis with the presence of autoantibodies to U1-ribonucleoprotein. Raynaud's phenomenon is seen in nearly all patients and pulmonary arterial hypertension is the most common cause of death in MCTD patients.
- 4A43.4 Diffuse eosinophilic fasciitis**  
Also called Shulman disease/diffuse fasciitis, diffuse eosinophilic fasciitis is a rare idiopathic disorder associated with induration of the skin (orange-peel sign) that generally develops rapidly. It is a dermal and hypodermal sclerosis associated with fibrotic thickening of the subcutaneous adipose lobular septa, superficial fascia, and perimysium. Full thickness excisional biopsy of skin lesions revealing fibrosis of the subcutaneous fascia is generally required for diagnosis. Onset follows unusual physical exertion and trauma, especially in males.
- 4A43.Y Other specified overlap non-organ specific systemic autoimmune disease**

**4A43.Z Undifferentiated non-organ specific systemic autoimmune disease**

**4A44**

### **Vasculitis**

Vasculitides represent a heterogenous group of diseases of multifactorial aetiology characterised by inflammatory lesions of vessels. These lesions consist of fibrinoid necrosis (necrotizing arteritis), giant cell infiltration without necrosis, immunoglobulins deposit or leukocytoclastic infiltration. The spectrum and severity of the systemic vasculitides is broad, from life or sight threatening fulminant disease to relatively minor skin disease.

**Coded Elsewhere:** Behçet disease (4A62)

Thrombotic microangiopathy, not elsewhere classified (3B65)

**4A44.0 Rhizomelic pseudopolyarthritits**

**4A44.1 Aortic arch syndrome**

Arteritis, often granulomatous, predominantly affecting the aorta and/or its major branches. Onset usually in patients younger than 50.

**4A44.2 Giant cell arteritis**

Arteritis, often granulomatous, usually affecting the aorta and/or its major branches, with a predilection for the branches of the carotid artery. Often involves the temporal artery. Onset usually in patients older than 50 and often associated with polymyalgia rheumatica.

**4A44.3 Single organ vasculitis**

Vasculitis in arteries or veins of any size in a single organ that has no features that indicate that it is a limited expression of a systemic vasculitis. The involved organ and vessel type should be included in the name (e.g. cutaneous SVV, testicular arteritis, central nervous system vasculitis). Vasculitis distribution may be unifocal or multifocal (diffuse) within an organ. Some patients originally diagnosed with SOV will develop additional disease manifestations that warrant re-defining the case as one of the systemic vasculitides (e.g. cutaneous arteritis later becoming systemic polyarteritis nodosa, etc.). Chapel Hill Consensus Conference, 2011)

**4A44.4 Polyarteritis nodosa**

Polyarteritis nodosa is an immunologically mediated systemic necrotising vasculitis affecting medium-sized vessels. In a few cases, the disease appears after viral infection but in the majority of cases there is no known triggering event. The clinical manifestations involve numerous organs and lead to a general alteration in the health status including rapid weight loss, paralysis of the peripheral nerves, renal disease, and digestive problems such as haemorrhages, perforation, appendicitis and pancreatitis. Arthralgia is almost always present and myalgia occurs in half of patients. Cardiac and cerebral anomalies (cephalalgia) are also reported, as well as ocular and genital (orchitis) manifestations.

- 4A44.5 Mucocutaneous lymph node syndrome**  
Mucocutaneous lymph node syndrome (Kawasaki disease) is a globally distributed acute vasculitis of young children affecting medium to small calibre arteries and if untreated leads to coronary artery aneurysms in about a quarter of cases. Cardinal signs include cervical lymphadenopathy, conjunctival injection, rash (maculopapular, erythrodermic or erythema multiforme-like), strawberry tongue, oropharyngeal erythema, erythema and swelling of hands and feet and periungual desquamation. The cause is unknown but thought to be environmental, possibly from viral infection. A variant of the disease has been linked to SARS CoV-2 infection.
- Inclusions:** Kawasaki syndrome
- 4A44.6 Sneddon syndrome**  
Sneddon syndrome associates livedo reticularis and neurological signs. Livedo is permanent, cyanotic, with no infiltration, and affects the limbs, trunk and sometimes the face. Neurological signs appear later and include cerebrovascular accidents, epilepsy, vertigo and more rarely a pseudobulbar syndrome, chorea, episodes of amnesia or transient amaurosis.
- 4A44.7 Primary angiitis of the central nervous system**  
In primary angiitis of the central nervous system, vasculitis is limited to the central nervous system. Primary angiitis of the central nervous system is a very rare disease, and its manifestation can be mimicked by many other diseases. Patients with primary angiitis commonly show headache, waxing and waning altered mental status, and transient ischemic attack-like events. Diagnosis is often based on angiography, although brain biopsy remains the only definitive diagnostic test.
- 4A44.8 Thromboangiitis obliterans**  
Thromboangiitis obliterans (TAO), or Buerger's disease, is a segmental occlusive inflammatory condition of arteries and veins, with thrombosis and recanalization of the affected vessels. It is a nonatherosclerotic inflammatory disease affecting small and medium sized arteries and veins of upper and lower extremities. TAO can be distinguished from other types of vasculitis based on its tendency to occur in young male subjects. The etiology and pathogenesis of TAO remains unknown; however, tobacco consumption plays a key role in the initiation and persistence of the disease.
- 4A44.9 Immune complex small vessel vasculitis**  
**Coded Elsewhere:** Anti-glomerular basement membrane antibody mediated disease (MF85)  
Susac syndrome (8A45.2Y)
- 4A44.90 Cryoglobulinaemic vasculitis**  
Vasculitis with cryoglobulin immune deposits affecting small vessels (predominantly capillaries, venules, or arterioles) and associated with cryoglobulins in serum. Skin and glomeruli are often involved.

<b>4A44.91</b>	Hypocomplementaemic urticarial vasculitis Vasculitis accompanied by urticaria and hypocomplementemia affecting small vessels (i.e., capillaries, venules, or arterioles), and associated with anti-C1q antibodies. Glomerulonephritis, arthritis, obstructive pulmonary disease, and ocular inflammation are common.(Chapel Hill Consensus Conference, 2011)
<b>4A44.92</b>	IgA vasculitis Vasculitis, with IgA1-dominant immune deposits, affecting small vessels (predominantly capillaries, venules, or arterioles). Often involves skin and gut, and frequently causes arthritis. Glomerulonephritis indistinguishable from IgA nephropathy may occur.  <b>Inclusions:</b> Henoch-Schönlein purpura <b>Coded Elsewhere:</b> Respiratory disorders in IgA vasculitis (CB05.4Y) Noninfectious enteritis or ulcer due to IgA vasculitis (DA94.Y)
<b>4A44.9Y</b>	Other specified immune complex small vessel vasculitis
<b>4A44.9Z</b>	Immune complex small vessel vasculitis, unspecified
<b>4A44.A</b>	<b>Antineutrophil cytoplasmic antibody-associated vasculitis</b> Necrotizing vasculitis, with few or no immune deposits, predominantly affecting small vessels (i.e., capillaries, venules, arterioles and small arteries), associated with MPO-ANCA or PR3-ANCA. Not all patients have ANCA. Add a prefix indicating ANCA reactivity, e.g. PR3-ANCA, MPO-ANCA, ANCA-negative.
<b>4A44.A0</b>	Microscopic polyangiitis Necrotizing vasculitis, with few or no immune deposits, predominantly affecting small vessels (i.e., capillaries, venules, or arterioles). Necrotizing arteritis involving small and medium sized arteries may be present. Necrotizing glomerulonephritis is very common. Pulmonary capillaritis often occurs. Granulomatous inflammation is absent.  <b>Inclusions:</b> Microscopic polyarteritis <b>Exclusions:</b> Polyarteritis nodosa (4A44.4)
<b>4A44.A1</b>	Granulomatosis with polyangiitis Necrotizing granulomatous inflammation usually involving the upper and lower respiratory tract, and necrotizing vasculitis affecting predominantly small to medium-sized vessels (e.g., capillaries, venules, arterioles, arteries and veins). Necrotizing glomerulonephritis is common. (Arthritis Rheum 1990;33:1101-1107)  <b>Inclusions:</b> Wegener granulomatosis
<b>4A44.A2</b>	Eosinophilic granulomatosis with polyangiitis Eosinophil-rich and necrotizing granulomatous inflammation often involving the respiratory tract, and necrotizing vasculitis predominantly affecting small to medium-sized vessels, and associated with asthma and eosinophilia. ANCA is most frequent when glomerulonephritis is present. (Arthritis Rheum 1990;33:1094-1100)  <b>Inclusions:</b> Churg-Strauss syndrome
<b>4A44.AY</b>	Other specified antineutrophil cytoplasmic antibody-associated vasculitis

- 4A44.AZ** Antineutrophil cytoplasmic antibody-associated vasculitis, unspecified
- 4A44.B** **Leukocytoclastic vasculitis**  
Leukocytoclastic vasculitis (hypersensitivity vasculitis; hypersensitivity angiitis) is a histopathological term commonly used to denote a small-vessel vasculitis. It may be localised to the skin or may manifest in other organs. The internal organs affected most commonly include the joints, the gastrointestinal tract, and the kidneys. The prognosis is good in the absence of internal involvement. Leukocytoclastic vasculitis has many causes including infections, drugs and systemic autoimmune diseases but no cause is identified in up to 50% of patients with this condition.
- 4A44.B0** Cutaneous leukocytoclastic vasculitis  
Skin-limited small vessel leucocytoclastic vasculitis of unspecified or unknown aetiology
- 4A44.BY** Other specified leukocytoclastic vasculitis
- 4A44.BZ** Leukocytoclastic vasculitis, unspecified
- 4A44.Y** **Other specified vasculitis**
- 4A44.Z** **Vasculitis, unspecified**
- 4A45** **Antiphospholipid syndrome**  
Antiphospholipid syndrome, also known as Hughes syndrome, is a systemic autoimmune condition characterised by the presence of antiphospholipid antibodies (aPL) in the serum of patients with thrombotic events and/or recurrent pregnancy complications.
- 4A45.0** **Primary antiphospholipid syndrome**
- 4A45.1** **Secondary antiphospholipid syndrome**

- 4A4Z** **Nonorgan specific systemic autoimmune disorders, unspecified**

## Autoinflammatory disorders (4A60-4A6Z)

**Coded Elsewhere:** Schnitzler syndrome (EB03)

- 4A60** **Monogenic autoinflammatory syndromes**  
Monogenic hereditary autoinflammatory diseases characterised by apparently unprovoked generalised inflammation in the absence of infection or high titre autoantibodies.

**4A60.0** **Familial Mediterranean fever**  
FMF is an autoinflammatory disease associated with mutations in pyrin resulting in enhanced IL1 beta production. This results in clinical attacks of inflammation in the form of fever and serositis in the form of peritoneal, pleural or synovial inflammation along with increased acute phase reactants.

**4A60.1** **Cryopyrin-associated periodic syndromes**  
CAPS is an autoinflammatory disease associated with gain of function changes in the cryopyrin protein, resulting in inflammasome activation and enhanced IL1 beta production. This results in clinical signs and symptoms of inflammation in the form of rash, fever, joint and eye symptoms with increased acute phase reactants.

*Inclusions:* Cryopyrinopathies

**4A60.2** **Tumour necrosis factor receptor 1 associated periodic syndrome**  
TRAPS is an autoinflammatory disease associated with heterozygous mutations in the gene coding for tumour necrosis factor (TNF) receptor 1 (TNFR1). This results in clinical attacks of inflammation in the form of fever and serositis in the form of peritoneal, pleural or synovial inflammation along with increased acute phase reactants.

**4A60.Y** **Other specified monogenic autoinflammatory syndromes**

**4A60.Z** **Autoinflammatory syndrome, unspecified**

**4A61** **SAPHO syndrome**  
SAPHO syndrome is characterised by a constellation of symptoms and signs including synovitis, acne conglobata or fulminans, palmoplantar pustulosis, hyperostosis and osteitis. Its aetiology is poorly understood.

**4A62** **Behçet disease**  
Behçet disease is a disease of incompletely understood aetiopathogenesis characterised by recurrent oral and/or genital aphthous ulcers accompanied by cutaneous, ocular, articular, gastrointestinal, and/or central nervous system inflammatory lesions. Small vessel vasculitis, thrombotic vasculopathy, arteritis and arterial aneurysms may occur. It has a high prevalence from the Eastern Mediterranean across Central Asia to China and Japan.

*Inclusions:* Adamantiades-Behçet disease

*Coded Elsewhere:* Transient neonatal Behçet disease (KA07.Y)

**4A6Y** **Other specified autoinflammatory disorders**

**4A6Z** **Autoinflammatory disorders, unspecified**

## Allergic or hypersensitivity conditions (4A80-4A8Z)

Allergy is a hypersensitivity reaction initiated by proven immunologic mechanisms.

Hypersensitivity is defined as conditions clinically resembling allergy that cause objectively reproducible symptoms or signs, initiated by exposure to a defined stimulus at a dose tolerated by normal subjects.

**Coded Elsewhere:** Eosinophilia (4B03)

Hypersensitivity reactions of unspecified nature (4B07)

**4A80**

### **Allergic or hypersensitivity disorders involving the respiratory tract**

Allergic or hypersensitivity disorders involving the respiratory tract includes several clinically different conditions that can be considered as hypersensitivity disorders of the upper and lower respiratory tract. The classification of these conditions is complex.

**Coded Elsewhere:** Vasomotor or allergic rhinitis (CA08)

Aspergillus-induced allergic or hypersensitivity conditions  
(CA82.4)

Chronic rhinosinusitis (CA0A)

Asthma (CA23)

Nasal polyp (CA0J)

Hypersensitivity pneumonitis due to organic dust (CA70)

**4A80.0**

#### **Drug-induced bronchospasm**

Drug-induced bronchospasm is a common clinical manifestation triggered by various drugs. It ranges in severity from mild to severe, and even fatal from post-anoxic brain damage. It can be manifested as an isolated event or in combination with other symptoms as representation of drug-induced anaphylaxis.

**4A80.1**

#### **Bronchospasm provoked by allergy to food substance**

Bronchospasm provoked by allergy to food allergens is clinical manifestation triggered by various foods as a phenotype of food hypersensitivity. It is more frequent in the youngest atopic patients and the most common foods responsible for these reactions are cow milk, peanut, egg and tree nuts. This clinical presentation can be manifested as an isolated event or in combination with other symptoms as representation of drug-induced anaphylaxis.

**4A80.Y**

#### **Other specified allergic or hypersensitivity disorders involving the respiratory tract**

**4A80.Z**

#### **Allergic or hypersensitivity disorders involving the respiratory tract, unspecified**

**4A81**

### **Allergic or hypersensitivity disorders involving the eye**

Allergic or hypersensitivity disorders involving the eye includes several clinically different conditions that can be considered as hypersensitivity disorders of the ocular surface. The classification of these conditions is complex.

**Coded Elsewhere:** Allergic conjunctivitis (9A60.02)

Vernal keratoconjunctivitis (9A60.5)

Giant papillary conjunctivitis (9A60.00)

Irritant contact blepharoconjunctivitis (EK02.11)

Acute atopic conjunctivitis (9A60.01)

Allergic contact blepharoconjunctivitis (9A06.72)

Atopic keratoconjunctivitis (9A60.0Y)

Vernal conjunctivitis (9A60.0Y)

**4A82**

### **Allergic or hypersensitivity disorders involving skin or mucous membranes**

Allergic or hypersensitivity disorders involving the skin and mucous includes a heterogeneous group of disorders involving skin and mucous membranes in which either allergy or hypersensitivity play a part.

**Coded Elsewhere:** Allergic contact dermatitis (EK00)

Photo-allergic contact dermatitis (EK01)

Allergic contact urticaria (EK10)

Protein contact dermatitis (EK11)

Allergic contact sensitisation (EK12)

Urticaria, angioedema and other urticarial disorders (EB00-EB0Y)

Atopic eczema (EA80)

Allergy to substances in contact with the skin (EK5Y)

**4A83**

### **Allergic or hypersensitivity disorders involving the gastrointestinal tract**

**Coded Elsewhere:** Allergic gastritis (DA42.4)

Allergic duodenitis (DA51.3)

Allergic or dietetic colitis (DB33.2)

Allergic or dietetic enteritis of small intestine (DA94.2)

**4A83.0**

### **Food-induced eosinophilic gastroenteritis**

A disease characterised by eosinophilic infiltration of various layers of stomach and intestine induced by specific food intake in the absence of any known cause of eosinophilia. It can occur in any age and the symptoms vary depending on the site of the intestinal tract involved and degree of eosinophilic inflammation, might include ascites, weight loss, oedema, obstruction.

- 4A83.1 Food-induced eosinophilic oesophagitis**  
A chronic, immune or antigen-mediated oesophageal disease characterised by eosinophilic infiltration of oesophageal wall induced by specific food intake in the absence of any known cause of eosinophilia. The symptoms are related to oesophageal dysfunction, including feeding disorders, reflux symptoms, vomiting, dysphagia, and food impaction.
- 4A83.Y Other specified allergic or hypersensitivity disorders involving the gastrointestinal tract**
- 4A83.Z Allergic or hypersensitivity disorders involving the gastrointestinal tract, unspecified**
- 4A84 Anaphylaxis**  
Anaphylaxis is a severe, life-threatening systemic hypersensitivity reaction characterised by being rapid in onset with potentially life-threatening airway, breathing, or circulatory problems and is usually, although not always, associated with skin and mucosal changes.
- 4A84.0 Anaphylaxis due to allergic reaction to food**  
Rapidly progressive, multi-system and potentially life-threatening reaction to exposure to a food allergen to which the affected individual has previously been sensitized.  
**Exclusions:** obstruction from food aspiration (ND72)  
food intolerance (DA96.02)
- 4A84.1 Drug-induced anaphylaxis**  
Anaphylaxis attributable to a drug. When severe it may be fatal. This systemic reaction usually develops within minutes to hours of administration of the drug, is often severe and may be fatal. The most frequent drugs causing anaphylaxis are antibiotics, particularly penicillins. Clinically there may be premonitory dizziness or faintness, skin tingling and erythema, followed by urticaria, angio-oedema, bronchospasm, abdominal pain and vasomotor collapse.  
**Coded Elsewhere:** Anaphylaxis due to radiocontrast media (EL80)
- 4A84.2 Anaphylaxis due to insect venom**  
Anaphylaxis due to insect venom is a severe systemic hypersensitivity reaction with rapid onset of cutaneous, vascular or respiratory symptoms and signs, either singly or in any combination after exposure (mainly by sting) to an insect venom in a sensitized patient.  
**Exclusions:** Harmful effects of or exposure to noxious substances,  
Substances chiefly nonmedicinal as to source, Venoms  
or toxins (NE61)
- 4A84.3 Anaphylaxis provoked by physical factors**  
Anaphylaxis provoked by physical factors covers a group of anaphylaxis phenotypes in which physical factors are the main triggers. The most relevant are: exercise-induced anaphylaxis, exercise-induced anaphylaxis dependent on food, cold-induced anaphylaxis.

- 4A84.30** Exercise-induced anaphylaxis  
Exercise-induced anaphylaxis is disorder in which anaphylaxis occurs after physical activity. The clinical features may include pruritus, urticarial weals, flushing, wheezing, and gastrointestinal disturbance including nausea, abdominal cramping, and diarrhoea. If physical activity continues, angioedema, laryngeal oedema, hypotension, and, ultimately, cardiovascular collapse may occur. Exercise-induced anaphylaxis is most commonly associated with IgE-mediated allergy to food whereby anaphylaxis occurs only if ingestion is followed temporally by exercise. Cessation of physical activity usually results in immediate improvement of symptoms.
- 4A84.31** Cold-induced anaphylaxis  
Cold-induced anaphylaxis is triggered by skin cooling. The deaths are directly caused by the anaphylactic reaction due to drowning when swimming in cold water.
- 4A84.3Y** Anaphylaxis provoked by other specified physical factors
- 4A84.3Z** Anaphylaxis provoked by unspecified physical factors
- 4A84.4** **Anaphylaxis due to inhaled allergens**  
Rapid progressive, multisystem life-threatening reaction due to the exposure to a sensitized inhaled allergen, such as particles from rubber gloves or latex products, animal dander and dust mite.  
Use additional external cause code, if desired, to identify agent.  
**Exclusions:** Allergic asthma with exacerbation (CA23.00)
- 4A84.5** **Anaphylaxis due to contact with allergens**  
Anaphylaxis resulting from skin or mucosal contact with a substance or substances capable of inducing IgE-mediated response in patients previously sensitized.  
Use additional external cause code, if desired, to identify agent.
- 4A84.6** **Anaphylaxis secondary to mast cell disorder**  
Symptoms of anaphylaxis secondary to mast cell disorders result from excessive mast cell mediator release, especially histamine, and may include pruritus and flushing, abdominal pain, diarrhea, dyspnoea, tachycardia, or profound hypotension. It happens in both children and adults, but in adults it can occur even without urticaria pigmentosa lesions. Levels of basal tryptase are constantly high. Fatal anaphylaxis has been described following hymenoptera stings and in the preoperative period.
- 4A84.Y** Other specified anaphylaxis
- 4A84.Z** Anaphylaxis, unspecified
- 4A85** **Complex allergic or hypersensitivity conditions**

- 4A85.0** **Drug or pharmacological agents hypersensitivity**  
Drug hypersensitivity reactions are the adverse effects of pharmaceutical formulations (including active drugs and excipients) that clinically resemble allergy. It belongs to type B adverse drug reactions, which are defined by the World Health Organization as the dose-independent, unpredictable, noxious, and unintended response to a drug taken at a dose normally used in humans. It covers many different clinical phenotypes with variable onset and severity.
- Coded Elsewhere:** Drug eruptions (EH60-EH6Z)
- Drug-induced bronchospasm (4A80.0)
  - Drug-induced aplastic anaemia (3A70.10)
  - Aspirin-induced asthma (CA23.20)
  - Samter syndrome (CA0A.0)
  - Photoallergic drug reaction (EH75)
  - Pseudolymphomatous drug hypersensitivity syndrome (EH6Y)
  - Anaphylaxis due to radiocontrast media (EL80)
- 4A85.00** Drug-induced liver hypersensitivity disease  
Drug-induced liver hypersensitivity disease is a relatively rare condition, but can have serious consequences for the individual patient, public health, regulatory agencies and the pharmaceutical industry. It is characterised by elevation in serum alanine-aminotransferase (ALT), conjugated bilirubin, or combined bilirubin, ALT and alkaline phosphatase (AP) levels > 2 times the upper limit of normal (ULN) and the most frequent related drugs are halothane, tienilic acid, dihydralazine, diclofenac, and carbamazepine.
- 4A85.01** Drug-induced kidney hypersensitivity  
Drug-induced kidney hypersensitivity constitutes an important cause of acute renal failure and chronic kidney disease in present day clinical practice. Different classes of drugs, by virtue of immunological mechanisms, initiate specific inflammatory renal responses, which are manifested by different clinical patterns, such as drug-induced interstitial nephritis. The drug-induced kidney hypersensitivity can manifest alone or in combination with other drug-induced organ or system hypersensitivity disorders.
- Coded Elsewhere:** Acute renal papillary necrosis due to drugs, biological agents or environmental toxins (GB53)
- 4A85.02** Drug-induced cytopenia  
Drug-induced cytopenia is a relatively common immune-mediated cytopenia and the target cells include erythrocytes, leukocytes, platelets and hematopoietic precursor cells in the marrow. The most frequent condition is the drug-induced immune thrombocytopenia and the most frequent implicated drugs are penicillin and structurally related drugs, quinine, quinidine, sulfonamide antibiotics, non-steroidal anti-inflammatory drugs and anticonvulsants.
- Coded Elsewhere:** Drug-induced immune thrombocytopenia (3B64.12)
- Drug-induced secondary agranulocytosis (4B00.01)

- 4A85.03** Drug-induced vasculitis  
Drug-induced vasculitis is an inflammatory vasculopathy associated with drugs of almost every class and accounting for approximately 3% of the vasculitides. Although small vessel disease limited to the skin is the most common form, involvement of blood vessels in virtually every organ system may occur. It can present multiorgan involvement and the mortality is described in up to 10% of cases.
- 4A85.04** Multiple drug hypersensitivity syndrome  
Multiple drug hypersensitivity syndrome is defined as drug allergies to two or more chemically different drugs. It differs from cross-reactivity (due to structural similarities, common metabolic pathways, or pharmacological mechanisms), flare-up reactions (exacerbation of an existing drug allergy by the early switch of therapy to a novel drug), and multiple drug intolerance syndrome.
- 4A85.0Y** Drug hypersensitivity of other specified type
- 4A85.0Z** Drug hypersensitivity of unspecified type
- 4A85.1** **Hypersensitivity to herbal and alternative medical therapies**  
Hypersensitivity to herbal and alternative medical therapies refers to unpredictable conditions clinically resembling allergy that cause objectively reproducible symptoms or signs, initiated by exposure to herbal and other alternative medical therapies, such as homeopathy, cupping or acupuncture. Herbal and alternative medical therapies are not customarily regarded as drugs, but can trigger immune and non-immune mediated reactions, which occur in susceptible individuals. These reactions are triggered by doses and procedures usually tolerated by normal subjects.
- Exclusions:** Adverse cutaneous reactions to herbal, homoeopathic or other alternative therapies (EH78)
- 4A85.2** **Food hypersensitivity**  
Food hypersensitivity reactions are adverse effects of food or food additives that clinically resemble allergy. Food allergy is an adverse reaction to food mediated by an immunologic mechanism, involving specific IgE (IgE-mediated), cell-mediated mechanisms (non-IgE-mediated) or both IgE- and cell-mediated mechanisms (mixed IgE- and non-IgE-mediated).
- Exclusions:** food intolerance (DA96.02)
- Coded Elsewhere:** Oral allergy syndrome (EK10.0)  
Contact urticaria due to food allergen (EK10.1)  
Anaphylaxis due to allergic reaction to food (4A84.0)  
Bronchospasm provoked by allergy to food substance (4A80.1)

- 4A85.20** Food-induced gastrointestinal hypersensitivity  
 Food-induced gastrointestinal hypersensitivity covers a group of gastrointestinal hypersensitivity disorders due to food allergens with variable onset, severity, clinical presentation and mechanisms.
- Coded Elsewhere:** Food-induced eosinophilic gastroenteritis (4A83.0)  
 Allergic or dietetic colitis (DB33.2)  
 Food-induced eosinophilic oesophagitis (4A83.1)  
 Allergic or dietetic enteritis of small intestine (DA94.2)  
 Food-induced non-IgE-mediated gastrointestinal hypersensitivity (DA42.41)
- 4A85.21** Food-induced urticaria or angioedema  
 Urticaria and/or angioedema triggered by ingestion or direct contact of food allergen in sensitized patient.
- 4A85.22** Allergic contact dermatitis due to food allergen  
 Allergic contact dermatitis, of which most common causal foods are spices, fruits, vegetables. Often occupational because of contact with chemical moieties, oleoresins. Systemic contact dermatitis is a rare variant because of ingestion.  
 Use additional external cause code, if desired, to identify agent.
- Coded Elsewhere:** Allergic contact dermatitis due to food flavours or additives (EK00.3)
- 4A85.2Y** Other specified food hypersensitivity
- 4A85.2Z** Food hypersensitivity, unspecified
- 4A85.3** **Allergic or hypersensitivity reactions to arthropods**  
 This includes both local cutaneous and systemic allergic and hypersensitivity reactions to contact with insects (e.g. bees, wasps and fire ants) and other arthropods (e.g. scorpions and spiders). Reactions are usually mediated via the immune system (IgE-mediated or non-IgE-mediated allergy).
- 4A85.30** Systemic allergic reaction due to Hymenoptera venom  
 Systemic Allergic Reaction due to Hymenoptera venom due to insect venom is a severe hypersensitivity reaction with rapid onset of cutaneous, vascular or respiratory symptoms and signs, either singly or in any combination after exposure (mainly by sting) to an insect venom in a sensitized patient.
- Coded Elsewhere:** Anaphylaxis due to insect venom (4A84.2)
- 4A85.31** Cutaneous allergic or hypersensitivity reactions to Hymenoptera venom  
 Cutaneous reactions to Hymenoptera venom are hypersensitivity reactions classified into normal local reactions and large local reactions. Large local reaction is defined as a swelling exceeding a diameter of 10 cm which lasts longer than 24 h; blisters may rarely be present.
- 4A85.32** Cutaneous allergic or hypersensitivity reactions to arthropods
- 4A85.Y** **Other specified complex allergic or hypersensitivity conditions**

<b>4A85.Z</b>	<b>Complex allergic or hypersensitivity conditions, unspecified</b>
<b>4A8Y</b>	<b>Allergic or hypersensitivity conditions of other specified type</b>
<b>4A8Z</b>	<b>Allergic or hypersensitivity conditions of unspecified type</b>

## Immune system disorders involving white cell lineages (4B00-4B0Z)

**Coded Elsewhere:** Immunodeficiencies with predominantly antibody defects (4A01.0)

- Combined immunodeficiencies (4A01.1)
- Defects in the complement system (4A00.1)
- Diseases of immune dysregulation (4A01.2)
- Other well-defined immunodeficiency syndromes due to defects in adaptive immunity (4A01.3)

### **4B00 Disorders of neutrophil number**

**Exclusions:** Decreased white blood cell count (MA16.10)

#### **4B00.0 Neutropaenia**

**Coded Elsewhere:** Transient neonatal neutropaenia (KA8D)  
Alloimmune neonatal neutropaenia (KA8E)

##### **4B00.00 Constitutional neutropaenia**

This is a granulocyte disorder characterised by an abnormally low number of neutrophils. Neutrophils usually make up 50-70% of circulating white blood cells and serve as the primary defence against infections by destroying bacteria in the blood.

**Exclusions:** Cartilage-hair hypoplasia (LD27.0)

##### **4B00.01 Acquired neutropaenia**

##### **4B00.0Z Neutropaenia, unspecified**

#### **4B00.1 Neutrophilia**

##### **4B00.10 Constitutional neutrophilia**

##### **4B00.11 Acquired neutrophilia**

**Coding Note:** Code also the causing condition

**Exclusions:** Non mast cell myeloproliferative neoplasms (2A20)

##### **4B00.1Z Neutrophilia, unspecified**

#### **4B00.Y Other specified disorders of neutrophil number**

### **4B01 Disorders of neutrophil function**

**Coded Elsewhere:** Functional neutrophil defects (4A00.0)

#### **4B01.0 Constitutional disorders of neutrophil function**

##### **4B01.00 Disorders of neutrophil adhesion**

- 4B01.01** Disorders of neutrophil chemotaxis
- 4B01.02** Disorders of neutrophil granule formation or release
- 4B01.03** Disorders of neutrophil oxidative metabolism
- 4B01.0Y** Other specified constitutional disorders of neutrophil function
- 4B01.0Z** Constitutional disorders of neutrophil function, unspecified
- 4B01.1** **Acquired disorders of neutrophil function**
- 4B01.Z** **Disorders of neutrophil function, unspecified**
- 4B02** **Eosinopenia**
- 4B02.0** **Constitutional decrease in eosinophil number**
- 4B02.1** **Acquired decrease in eosinophil number**
- 4B02.Z** **Eosinopenia, unspecified**
- 4B03** **Eosinophilia**
- 4B03.0** **Constitutional eosinophilia**
- 4B03.1** **Acquired eosinophilia**
- 4B03.Z** **Eosinophilia, unspecified**
- 4B04** **Disorders with decreased monocyte counts**
- 4B05** **Disorders with increased monocyte counts**
- 4B06** **Acquired lymphopenia**
- 4B07** **Acquired lymphocytosis**
  - Exclusions:** Chronic lymphocytic leukaemia or small lymphocytic lymphoma (2A82.0)
  - Coded Elsewhere:** Infectious mononucleosis (1D81)
- 4B0Y** **Other specified immune system disorders involving white cell lineages**
- 4B0Z** **Immune system disorders involving white cell lineages, unspecified**

## Certain disorders involving the immune system (4B20-4B2Y)

Disorders in which disturbed immune regulation plays an important part but which cannot be more precisely located elsewhere in the classification.

- Exclusions:**
- Failure or rejection of transplanted organs or tissues (NE84)
  - Monoclonal gammopathy of undetermined significance (2A83.0)

**Coded Elsewhere:** Hereditary angioedema (4A00.14)

**4B20**

### Sarcoidosis

Sarcoidosis is a multisystem disorder of unknown cause characterised by the formation of immune granulomas in involved organs. The lung and the lymphatic system are predominantly affected, but virtually every organ may be involved. Other severe manifestations result from cardiac, neurological, ocular, kidney or laryngeal localizations.

**4B20.0**

### Sarcoidosis of lung

**4B20.1**

### Sarcoidosis of lymph nodes

Lymphadenopathy is very common in sarcoidosis. Intrathoracic nodes are enlarged in 75 to 90% of all patients; usually this involves the hilar nodes, but the paratracheal nodes are commonly involved. Peripheral lymphadenopathy is very common, particularly involving the cervical (the most common head and neck manifestation of the disease), axillary, epitrochlear, and inguinal nodes.

**4B20.2**

### Sarcoidosis of the digestive system

This is a syndrome involving abnormal collections of chronic inflammatory cells (granulomas) that can form as nodules in the digestive system.

**Coded Elsewhere:** Gastritis due to sarcoidosis (DA42.Y)

Oesophagitis due to sarcoidosis (DA24.Y)

**4B20.3**

### Neurosarcoidosis

This refers to sarcoidosis, a condition of unknown cause featuring granulomas in various tissues, involving the central nervous system (brain and spinal cord). It can have many manifestations, but abnormalities of the cranial nerves (a group of twelve nerves supplying the head and neck area) are the most common.

**4B20.4**

### Ocular sarcoidosis

This is a syndrome involving abnormal collections of chronic inflammatory cells (granulomas) that can form as nodules in multiple organs.

**Coded Elsewhere:** Uveoparotid fever (4B20.Y)

**4B20.5**

### Cutaneous sarcoidosis

**4B20.Y**

### Other specified sarcoidosis

**4B20.Z**

### Sarcoidosis, unspecified

**4B21**

### Polyclonal hypergammaglobulinaemia

**4B22**

### **Cryoglobulinaemia**

**Coded Elsewhere:** Cryoglobulinaemic vasculitis (4A44.90)

Cutaneous microvascular disturbances due to monoclonal cryoglobulins (EF5Y)

**4B23**

### **Immune reconstitution inflammatory syndrome**

This is a condition seen in some cases of AIDS or immunosuppression, in which the immune system begins to recover, but then responds to a previously acquired opportunistic infection with an overwhelming inflammatory response that paradoxically makes the symptoms of infection worse.

**4B24**

### **Graft-versus-host disease**

Graft-versus-host disease (GVHD) occurs when lymphoid cells from an immunocompetent donor are introduced into a histo-incompatible recipient incapable of rejecting them. This usually occurs as a result of haematopoietic stem cell transplantation. The main targets attacked by the donor lymphocytes are the recipient's skin, gastrointestinal tract and liver. Acute GVHD, normally occurring within the first 100 days following transplantation, has a high mortality. The acute phase may be followed by chronic GVHD, which can also arise de novo. This usually presents as a lichenoid rash but can develop into a severe fibrosing disease affecting skin, lungs and liver.

**4B24.0**

#### **Acute graft-versus-host disease**

Graft-versus-host disease presenting normally within the first 100 days of engraftment. It presents most commonly with a maculopapular rash accompanied by fever. The prognosis correlates with the extent of skin involvement, which may progress to widespread epidermal necrolysis, and the severity of gastrointestinal and liver involvement which may manifest as diarrhoea and jaundice respectively. There is a high mortality in severe acute graft-versus-host disease.

**4B24.1**

#### **Chronic graft-versus-host disease**

Chronic graft-versus-host disease (GVHD) presents more than 100 days after engraftment of immunocompetent donor lymphoid cells. It has specific clinical features by which it can be distinguished from acute GVHD. It may arise de novo but frequently follows acute GVHD. Less commonly, it occurs concurrently with acute GVHD. The earlier stages of chronic GVHD are characterised by a widespread lichenoid rash, poikiloderma and involvement of nails and oral mucous membranes. If the disease remains active, progressive sclerosis of the skin and deeper tissues may result in joint contractures, fibrosis of internal organs and severe malabsorption.

**4B24.Y**

#### **Other specified graft-versus-host disease**

**4B24.Z**

#### **Graft-versus-host disease, unspecified**

**4B2Y**

### **Other specified disorders involving the immune system**

**4B40**

**Diseases of thymus**

**Exclusions:** thymic aplasia or hypoplasia with immunodeficiency (LD44.N0)  
Myasthenia gravis (8C60)

**Coded Elsewhere:** Thymic tumours

**4B40.0**

**Persistent hyperplasia of thymus**

This refers to a persistent enlargement ("hyperplasia") of the thymus.

**4B40.1**

**Abscess of thymus**

**4B40.2**

**Good syndrome**

This is a condition that occurs in adults in whom hypogammaglobulinemia, deficient cell-mediated immunity, and benign thymoma may develop almost simultaneously.

**4B40.Y**

**Other specified diseases of thymus**

**4B40.Z**

**Diseases of thymus, unspecified**

**4B4Y**

**Other specified diseases of the immune system**

**4B4Z**

**Diseases of the immune system, unspecified**

# CHAPTER 05

---

## Endocrine, nutritional or metabolic diseases

This chapter has 148 four-character categories.

Code range starts with 5A00

This chapter includes endocrine diseases, nutritional diseases as well as metabolic diseases.

**Exclusions:** Transitory endocrine or metabolic disorders specific to fetus or newborn  
(KB60-KB6Z)

Pregnancy, childbirth or the puerperium (Chapter 18)

**Coded Elsewhere:** Symptoms, signs or clinical findings of endocrine, nutritional or metabolic diseases (MA50-MA6Y)

Endocrine, nutritional or metabolic diseases complicating pregnancy, childbirth or the puerperium (JB64.2)

This chapter contains the following top level blocks:

- Endocrine diseases
- Nutritional disorders
- Metabolic disorders
- Postprocedural endocrine or metabolic disorders

### Endocrine diseases (5A00-5B3Z)

**Coded Elsewhere:** Neoplasms of the endocrine system

Endocrine tumours

### Disorders of the thyroid gland or thyroid hormones system (5A00-5A0Z)

Disorders due to dysfunction of thyroid gland and regulation systems of thyroid hormone actions including dysfunction of the pituitary, hypothalamus, or thyroid hormone receptors.

#### **5A00                    Hypothyroidism**

##### **5A00.0                  Congenital hypothyroidism**

Hypothyroidism is a condition where the thyroid gland produces too little or no thyroid hormone, and the condition arises at birth. Common clinical features include decreased activity and increased sleep, feeding difficulty and constipation, prolonged jaundice, myxedematous facies, large fontanelles (especially posterior), macroglossia, a distended abdomen with umbilical hernia, and hypotonia.

**Coded Elsewhere:** Congenital central hypothyroidism (5A61.41)

<b>5A00.00</b>	Permanent congenital hypothyroidism with diffuse goitre A condition caused by a partial or complete loss of thyroid function due to failure of the thyroid to correctly develop during the antenatal period. This condition is characterised by a swollen, smooth thyroid gland, and in infants by a dull look, puffy face, and thick tongue that sticks out. This condition may also present with choking episodes, constipation, dry brittle hair, jaundice, lack of muscle tone, low hairline, poor feeding, short height, sleepiness, or sluggishness.  <b>Exclusions:</b> transitory congenital goitre with normal function (KB62)
<b>5A00.01</b>	Permanent congenital hypothyroidism without goitre This is a permanent congenital state in which the thyroid gland does not make enough thyroid hormone. This diagnosis is without swelling of the thyroid gland.
<b>5A00.02</b>	Pendred syndrome Pendred syndrome is characterised by the association of congenital bilateral neurosensory deafness, thyroid goitre, cochleovestibular malformation and potential vestibular dysfunction.
<b>5A00.03</b>	Transient congenital hypothyroidism Transient congenital hypothyroidism is defined as transient thyroid dysfunction with mildly elevated thyroid-stimulating hormone (TSH) and low thyroxine (FT4) levels which return to normal either very promptly and spontaneously, or after several months of thyroxine therapy. The disorder is due to a variety of causes including iodine deficiency or exposure to iodine-containing compounds, transplacental passage of blocking maternal antibodies, and dyshormonogenesis.  <b>Exclusions:</b> Transitory congenital goitre with normal function (KB62)
<b>5A00.04</b>	Congenital hypothyroidism due to iodine deficiency Hypothyroidism is a condition which arises at birth where the thyroid gland produces too little or no thyroid hormone and it can be induced by iodine-deficiency.  <b>Exclusions:</b> Subclinical iodine-deficiency hypothyroidism (5A00.22)
<b>5A00.0Y</b>	Other specified congenital hypothyroidism
<b>5A00.0Z</b>	Congenital hypothyroidism, unspecified
<b>5A00.1</b>	<b>Iodine-deficiency-related thyroid disorders or allied conditions</b> Any condition caused by aberrant thyroid function due to a deficiency of iodine. Confirmation is by blood test.  <b>Exclusions:</b> congenital iodine-deficiency syndrome (5A00.04) Subclinical iodine-deficiency hypothyroidism (5A00.22)
<b>5A00.10</b>	Iodine-deficiency-related diffuse goitre Diffuse enlargement of the thyroid gland due to iodine deficiency.
<b>5A00.11</b>	Iodine-deficiency-related multinodular goitre Multinodular enlargement of the thyroid gland due to iodine deficiency.  <b>Inclusions:</b> Iodine-deficiency-related nodular goitre

- 5A00.1Z** Iodine-deficiency-related thyroid disorders or allied conditions, unspecified
- 5A00.2** **Acquired hypothyroidism**  
Acquired hypothyroidism is a condition where the thyroid gland produces too little or no thyroid hormone, and the condition arises only after birth.  
**Exclusions:** Postprocedural hypothyroidism (5D40)  
iodine-deficiency-related hypothyroidism (5A00.1)  
**Coded Elsewhere:** Acquired central hypothyroidism (5A61.40)  
Dementia due to acquired hypothyroidism (6D85.Y)
- 5A00.20** Hypothyroidism due to medicaments or other exogenous substances  
A condition caused by an underactive thyroid due to a medicaments or other exogenous substances. This condition may present with fatigue, increased sensitivity to cold, constipation, dry skin, weight gain, muscle weakness, elevated blood cholesterol, muscle aches, joint pain or swelling, heavier or irregular menstrual periods, thinning hair, depression, or impaired memory.
- 5A00.21** Myxoedema coma  
A life-threatening hypothyroid condition with long-standing severe untreated hypothyroidism in whom adaptive mechanisms fail to maintain homeostasis.
- 5A00.22** Subclinical iodine-deficiency hypothyroidism  
A condition with elevated serum TSH level, but with normal thyroid hormone levels, which is induced by iodine-deficiency
- 5A00.2Y** Other specified acquired hypothyroidism
- 5A00.2Z** Acquired hypothyroidism, unspecified
- 5A00.Z** **Hypothyroidism, unspecified**
- 5A01** **Nontoxic goitre**  
Enlargement of the thyroid gland due to follicular multiplication, unaccompanied by hyperthyroidism or thyrotoxicosis  
**Exclusions:** congenital goitre NOS (5A00.00)  
congenital parenchymatous goitre (5A00.00)  
iodine-deficiency-related goitre (5A00.1)  
congenital diffuse goitre (5A00.00)
- 5A01.0** **Nontoxic diffuse goitre**  
Diffuse enlargement of the thyroid gland due to follicular multiplication, unaccompanied by hyperthyroidism or thyrotoxicosis
- 5A01.1** **Nontoxic single thyroid nodule**  
Single tumour of the thyroid gland due to follicular multiplication, unaccompanied by hyperthyroidism or thyrotoxicosis

<b>5A01.2</b>	<b>Nontoxic multinodular goitre</b> Multiple nodules of the thyroid gland due to follicular multiplication, unaccompanied by hyperthyroidism or thyrotoxicosis
<b>5A01.Z</b>	<b>Nontoxic goitre, unspecified</b>
<b>5A02</b>	<p><b>Thyrotoxicosis</b> A hypermetabolic condition associated with elevated levels of free thyroxine and/or free triiodothyronine resulting in excess synthesis and secretion of thyroid hormone</p> <p><b>Exclusions:</b> Transitory neonatal hyperthyroidism (KB62.0)</p> <p><b>Coded Elsewhere:</b> Dysthyroid exophthalmos (9A20.00)</p>
<b>5A02.0</b>	<p><b>Thyrotoxicosis with diffuse goitre</b> Thyrotoxicosis occurs by the ingestion of excessive amounts of exogenous thyroid hormone in the form of thyroid hormone supplements such as the most widely used supplement levothyroxine.</p> <p><b>Inclusions:</b> Toxic diffuse goitre Graves disease</p>
<b>5A02.1</b>	<p><b>Thyrotoxicosis with toxic single thyroid nodule</b> <b>Inclusions:</b> Thyrotoxicosis with toxic uninodular goitre</p>
<b>5A02.2</b>	<p><b>Thyrotoxicosis with toxic multinodular goitre</b> Thyrotoxicosis caused by functioning thyroid multinodules</p>
<b>5A02.3</b>	<b>Thyrotoxicosis from ectopic thyroid tissue</b>
<b>5A02.4</b>	<p><b>Thyrotoxicosis factitia</b> A condition of thyrotoxicosis caused by the ingestion of exogenous thyroid hormone</p>
<b>5A02.5</b>	<p><b>Thyroid crisis</b> Thyrotoxic crisis (or thyroid storm) is a rare but severe complication of hyperthyroidism, which may occur when a thyrotoxic patient becomes very sick or physically stressed.</p> <p><b>Inclusions:</b> Thyroid storm</p>
<b>5A02.6</b>	<p><b>Secondary hyperthyroidism</b> Overproduction of thyroid hormone in the thyroid gland induced by dysfunction of the pituitary gland or hypothalamus.</p>
<b>Coding Note:</b>	Code also the causing condition
	<p><b>Exclusions:</b> Generalised resistance to thyroid hormone (5A05) Selective pituitary resistance to thyroid hormone (5A02)</p>
<b>5A02.Y</b>	<b>Other specified thyrotoxicosis</b>
<b>5A02.Z</b>	<b>Thyrotoxicosis, unspecified</b>

**5A03**

### **Thyroiditis**

Thyroiditis is the inflammation of the thyroid gland. It includes acute and chronic forms of thyroiditis. Thyroiditis is usually caused by autoimmune reaction to the thyroid, resulting in inflammation and damage to the thyroid cells. The symptoms include fatigue, weight gain, depression, dry skin, and constipation.

**Inclusions:** Acquired hypothyroidism (5A00.2)

Thyrotoxicosis (5A02)

**Coded Elsewhere:** Postpartum thyroiditis (JB44.5)

**5A03.0**

#### **Acute thyroiditis**

Acute thyroiditis is a rare form of thyroiditis directly caused by an infection, frequently bacterial.

**5A03.1**

#### **Subacute thyroiditis**

A self-limited thyroiditis associated with a triphasic clinical course of hyperthyroidism, hypothyroidism, and return to normal thyroid function. It is thought to be caused by a viral infection.

**Inclusions:** de Quervain thyroiditis

giant-cell thyroiditis

granulomatous thyroiditis

**Exclusions:** Autoimmune thyroiditis (5A03.2)

**5A03.2**

#### **Autoimmune thyroiditis**

A chronic inflammatory disorder of the thyroid gland associated with abnormal circulatory antibodies.

**5A03.20**

Hashimoto thyroiditis

**5A03.21**

Painless thyroiditis

A destructive thyroiditis which has an autoimmune basis in the non-postpartum period. An inflammation of the thyroid gland characterised by transient hyperthyroidism, followed by hypothyroidism and then recovery.

**5A03.2Y**

Other specified autoimmune thyroiditis

**5A03.2Z**

Autoimmune thyroiditis, unspecified

**5A03.Y**

**Other specified thyroiditis**

**5A03.Z**

**Thyroiditis, unspecified**

**5A04**

### **Hypersecretion of calcitonin**

This is the process of elaborating, releasing, and oozing a 32-amino acid linear polypeptide hormone that is produced in humans primarily by the parafollicular cells (also known as C-cells) of the thyroid, and in many other animals in the ultimobranchial body.

**Inclusions:** Hypersecretion of thyrocalcitonin

C-cell hyperplasia of thyroid

**5A05**

**Generalised resistance to thyroid hormone**

Decreased thyroid hormone action, generally induced by mutation of thyroid hormone receptors.

**5A06**

**Sick-euthyroid syndrome**

**5A0Y**

**Other specified disorders of the thyroid gland or thyroid hormones system**

**5A0Z**

**Disorders of the thyroid gland or thyroid hormones system, unspecified**

Diabetes mellitus (5A10-5A2Y)

A metabolic disorder with heterogenous aetiologies which is characterised by chronic hyperglycaemia and disturbances of carbohydrate, fat and protein metabolism resulting from defects in insulin secretion, insulin action, or both.

**Coded Elsewhere:** Diabetes mellitus in pregnancy (JA63)

Neonatal diabetes mellitus (KB60.2)

**5A10**

**Type 1 diabetes mellitus**

Diabetes mellitus type 1 (type 1 diabetes, T1DM, formerly insulin dependent or juvenile diabetes) is a form of diabetes mellitus that results from destruction of insulin-producing beta cells, mostly by autoimmune mechanisms. The subsequent lack of insulin leads to increased blood and urine glucose.

**Exclusions:** Type 2 diabetes mellitus (5A11)

Diabetes mellitus, other specified type (5A13)

Diabetes mellitus in pregnancy (JA63)

**Coded Elsewhere:** Pre-existing type 1 diabetes mellitus in pregnancy (JA63.0)

**5A11**

**Type 2 diabetes mellitus**

Diabetes mellitus type 2 (formerly noninsulin-dependent diabetes mellitus (NIDDM) or adult-onset diabetes) is a metabolic disorder that is characterised by high blood glucose in the context of insulin resistance and relative insulin deficiency.

**Inclusions:** non-insulin-dependent diabetes of the young

**Exclusions:** Diabetes mellitus in pregnancy (JA63)

Diabetes mellitus, other specified type (5A13)

Idiopathic Type 1 diabetes mellitus (5A10)

**Coded Elsewhere:** Pre-existing type 2 diabetes mellitus in pregnancy (JA63.1)

**5A12**

**Malnutrition-related diabetes mellitus**

**5A13**

**Diabetes mellitus, other specified type**

Diabetes mellitus which cannot be classified as either Type 1 or Type 2 diabetes mellitus.

**Exclusions:** Diabetes mellitus in pregnancy (JA63)

Type 2 diabetes mellitus (5A11)

Idiopathic Type 1 diabetes mellitus (5A10)

**5A13.0**

**Diabetes mellitus due to genetic defects of beta cell function**

Other specified diabetes mellitus due to genetic defects of beta cell function is a form of diabetes, which is associated with monogenetic defects in beta-cell function.

**5A13.1**

**Diabetes mellitus due to genetic defects in insulin action**

Other specified diabetes mellitus due to genetic defects in insulin action is a form of diabetes, which results from genetically determined abnormalities of insulin action. The metabolic abnormalities associated with mutations of the insulin receptor may range from hyperinsulinemia and modest hyperglycaemia to severe diabetes.

**5A13.2**

**Diabetes mellitus due to diseases of the exocrine pancreas**

Other specified diabetes mellitus due to diseases of the exocrine pancreas is a form of diabetes which caused by any process that diffusely injures the pancreas. Acquired processes include pancreatitis, trauma, infection, pancreatectomy, and pancreatic carcinoma. With the exception of that caused by cancer, damage to the pancreas must be extensive for diabetes to occur.

**5A13.3**

**Diabetes mellitus due to endocrinopathies**

Other specified diabetes mellitus due to endocrinopathies is a form of diabetes caused by several hormones (e.g., growth hormone, cortisol, glucagon, epinephrine), which antagonize insulin action. Excess amounts of these hormones (e.g., acromegaly, Cushing's syndrome, glucagonoma, pheochromocytoma, respectively) can cause diabetes. This generally occurs in individuals with preexisting defects in insulin secretion, and hyperglycaemia typically resolves when the hormone excess is resolved.

**5A13.4**

**Diabetes mellitus due to drug or chemical**

Other specified diabetes mellitus due to drug or chemical is a form of diabetes, which is caused by drug or chemical substance that impairs insulin secretion and insulin action.

**5A13.5**

**Diabetes mellitus due to uncommon forms of immune-mediated diabetes**

Other specified diabetes mellitus due to uncommon forms of immune-mediated diabetes is a form of diabetes, which is caused by two known conditions. The stiff-man syndrome is an autoimmune disorder of the central nervous system characterised by stiffness of the axial muscles with painful spasms. Patients usually have high titres of the GAD autoantibodies, and approximately one-third will develop diabetes.

<b>5A13.6</b>	<b>Diabetes mellitus due to other genetic syndromes</b> Other specified diabetes mellitus due to other genetic syndromes is a form of diabetes, which is associated with genetic syndromes.
<b>Coding Note:</b>	Use additional code, if desired, to identify any associated genetic syndrome
	<b>Coded Elsewhere:</b> Wolfram syndrome (5A61.5)
	Maternally inherited diabetes and deafness (LD2H.Y)
	Thiamine-responsive megaloblastic anaemia syndrome (5C63.Y)
	Woodhouse-Sakati syndrome (5A61.0)
	Mitochondrial myopathy with diabetes mellitus (8C73.Y)
<b>5A13.7</b>	<b>Diabetes mellitus due to clinically defined subtypes or syndromes</b> Diabetes mellitus that has clinically defined subtypes or associated syndromes
<b>5A13.Y</b>	<b>Diabetes mellitus due to other specified cause</b>
<b>5A14</b>	<b>Diabetes mellitus, type unspecified</b>
	<b>Exclusions:</b> Idiopathic Type 1 diabetes mellitus (5A10)
	Type 2 diabetes mellitus (5A11)
	Diabetes mellitus, other specified type (5A13)
	Diabetes mellitus in pregnancy (JA63)

### Acute complications of diabetes mellitus (5A20-5A2Y)

<b>5A20</b>	<b>Diabetic hyperosmolar hyperglycaemic state</b>
<b>Coding Note:</b>	Code also the causing condition
<b>5A20.0</b>	<b>Hyperosmolar hyperglycaemic state without coma</b>
<b>Coding Note:</b>	Code also the causing condition
<b>5A20.1</b>	<b>Hyperosmolar hyperglycaemic state with coma</b>
<b>Coding Note:</b>	Code also the causing condition
<b>5A20.Z</b>	<b>Diabetic hyperosmolar hyperglycaemic state, unspecified</b>
<b>Coding Note:</b>	Code also the causing condition
<b>5A21</b>	<b>Hypoglycaemia in the context of diabetes mellitus</b>
<b>Coding Note:</b>	Code also the causing condition
<b>5A21.0</b>	<b>Hypoglycaemia in the context of diabetes mellitus without coma</b>
<b>Coding Note:</b>	Code also the causing condition
<b>5A21.1</b>	<b>Hypoglycaemia in the context of diabetes mellitus with coma</b>
<b>Coding Note:</b>	Code also the causing condition

**5A21.Z** **Hypoglycaemia in the context of diabetes, unspecified**

**Coding Note:** Code also the causing condition

**5A22** **Diabetic acidosis**

**Coding Note:** Code also the causing condition

**5A22.0** **Diabetic ketoacidosis without coma**

**Coding Note:** Code also the causing condition

**5A22.1** **Diabetic lactic acidosis**

**Coding Note:** Code also the causing condition

**5A22.2** **Diabetic metabolic acidosis**

**Coding Note:** Always assign an additional code for diabetes mellitus

**5A22.3** **Diabetic ketoacidosis with coma**

**Coding Note:** Code also the causing condition

**5A22.Y** **Other specified diabetic acidosis**

**Coding Note:** Code also the causing condition

**5A22.Z** **Diabetic acidosis, unspecified**

**Coding Note:** Code also the causing condition

**5A23** **Diabetic coma**

**Coding Note:** Code also the causing condition

**5A24** **Uncontrolled or unstable diabetes mellitus**

Brittle diabetes mellitus is a term used to describe particularly hard-to-control Type 1 or Type 2 diabetes mellitus. It results in frequent, extreme swings in blood glucose levels, causing hyperglycaemia that could lead to ketoacidosis or hypoglycaemia.

**Coding Note:** Code also the causing condition

**5A2Y** **Other specified acute complications of diabetes mellitus**

**Coding Note:** Code also the causing condition

Other disorders of glucose regulation or pancreatic internal secretion (5A40-5A4Z)

**Exclusions:** Benign neoplasm of endocrine pancreas (2E92.9)

Multiple endocrine neoplasia type 1 (2F7A.0)

Malignant neoplasm of pancreas (2C10)

**Coded Elsewhere:** Somatostatinoma (2C10.1)

VIPoma (2C10.1)

PPoma (2C10.1)

GRFoma (2C10.1)

**5A40**

### **Intermediate hyperglycaemia**

A metabolic disorder characterised by glucose levels too high to be considered normal, though not high enough to meet the criteria for diabetes.

**Inclusions:** prediabetes

Impaired glucose regulation

**Exclusions:** Diabetes mellitus, other specified type (5A13)

Idiopathic Type 1 diabetes mellitus (5A10)

Type 2 diabetes mellitus (5A11)

Diabetes mellitus, type unspecified (5A14)

Elevated blood glucose level (MA18.0)

**Coded Elsewhere:** Neonatal hyperglycaemia (KB60.3)

**5A40.0**

### **Impaired fasting glucose**

Impaired glucose tolerance is a metabolic disorder with FPG 110–125 mg/dl (6.1–6.9 mmol/l).

**5A40.1**

### **Impaired glucose tolerance**

Impaired glucose tolerance (IGT) is a metabolic disorder, which is characterised by 2-h postload glucose 140–199 mg/dl (7.8–11.1 mmol/l).

**5A40.Y**

### **Other specified intermediate hyperglycaemia**

**5A40.Z**

### **Intermediate hyperglycaemia, unspecified**

**5A41**

### **Hypoglycaemia without associated diabetes**

**Exclusions:** Hypoglycaemia in the context of diabetes mellitus (5A21)

**Coded Elsewhere:** Neonatal hypoglycaemia (KB60.4)

**5A42**

### **Increased secretion of glucagon**

**Exclusions:** Multiple endocrine neoplasia type 1 (2F7A.0)

**Coded Elsewhere:** Glucagonoma (2C10.1)

**5A43**

### **Abnormal secretion of gastrin**

**Coded Elsewhere:** Gastrinoma (2C10.1)

**5A43.0**

### **Drug-induced hypergastrinaemia**

A form of hypergastrinaemia that can be induced by drugs.

<b>5A43.1</b>	<b>Zollinger-Ellison syndrome</b> A syndrome characterised by the presence of a gastrin-secreting tumour, usually in the pancreas or duodenum, resulting in increased gastric acidity and formation of gastric ulcers. Signs and symptoms include abdominal pain and diarrhea. It may be sporadic or a manifestation of multiple endocrine neoplasia type 1.
	<b>Coded Elsewhere:</b> Anastomotic ulcer due to Zollinger-Ellison syndrome (DA62.Y) Gastric ulcer due to Zollinger-Ellison syndrome (DA60.Y) Duodenal ulcer due to Zollinger-Ellison syndrome (DA63.Y)
<b>5A43.Y</b>	<b>Other specified abnormal secretion of gastrin</b>
<b>5A43.Z</b>	<b>Abnormal secretion of gastrin, unspecified</b>
<b>5A44</b>	<b>Insulin-resistance syndromes</b>
	<b>Coding Note:</b> Code also the causing condition
<b>5A45</b>	<b>Persistent hyperinsulinaemic hypoglycaemia of infancy</b> Congenital isolated hyperinsulinism, or Persistent hyperinsulinaemic hypoglycaemia of infancy (PHHI) is defined by an inappropriate oversecretion of insulin by the endocrine pancreas that is responsible for profound hypoglycaemia, which requires aggressive medical and/or surgical treatment to prevent severe and irreversible brain damage. PHHI is a genetically heterogeneous disorder with two types of histological lesions: diffuse (DiPHHI) and focal (FoPHHI) which are clinically indistinguishable.
<b>5A4Y</b>	<b>Other specified disorders of glucose regulation or pancreatic internal secretion</b>
<b>5A4Z</b>	<b>Disorders of glucose regulation or pancreatic internal secretion, unspecified</b>
Disorders of the parathyroids or parathyroid hormone system (5A50-5A5Z)	
Disorders of the parathyroids and parathyroid hormone system generally refer to conditions with inappropriate secretion and/or actions of parathyroid hormone that cause dysregulation of calcium metabolism.	
	<b>Exclusions:</b> Hypocalcaemic vitamin D dependent rickets (5C63.20) Hypovitaminosis D (5B57) Hyperphosphataemic familial tumoural calcinosis (5C54.1) Hypocalcaemic vitamin D resistant rickets (5C63.21)
<b>5A50</b>	<b>Hypoparathyroidism</b> Hypoparathyroidism is a condition with insufficient biological actions of parathyroid hormone due to impaired secretion of parathyroid hormone or refractoriness of target tissues to parathyroid hormone.
	<b>Exclusions:</b> Postprocedural hypoparathyroidism (5D42) tetany NOS (MB47.D)
	<b>Coded Elsewhere:</b> Transitory neonatal hypoparathyroidism (KB64)

<b>5A50.0</b>	<b>Hypoparathyroidism due to impaired parathyroid hormone secretion</b> Hypoparathyroidism due to impaired PTH secretion is a condition with low circulating PTH level and hypocalcaemia caused by being unable to secrete PTH from parathyroids in response to hypocalcaemia with pathological or functional defects in parathyroids.
	<b>Coded Elsewhere:</b> CATCH 22 phenotype (LD44.N0)
<b>5A50.00</b>	Idiopathic hypoparathyroidism <b>Exclusions:</b> Autoimmune polyendocrinopathy type 1 (5B00)
<b>5A50.01</b>	Secondary hypoparathyroidism <b>Coding Note:</b> Code also the causing condition
<b>5A50.02</b>	Hypoparathyroidism due to destruction of the parathyroid glands Dysfunction of parathyroid glands can be caused by several etiologies such as radiation, destruction of parathyroid glands by granulomatous disease or cancer infiltration, and deposition of iron or copper.
<b>5A50.03</b>	Autoimmune hypoparathyroidism
<b>5A50.0Y</b>	Other specified hypoparathyroidism due to impaired parathyroid hormone secretion
<b>5A50.0Z</b>	Hypoparathyroidism due to impaired parathyroid hormone secretion, unspecified
<b>5A50.1</b>	<b>Pseudohypoparathyroidism</b> Pseudohypoparathyroidism is a condition with refractoriness to parathyroid hormone of its target tissues especially kidney that causes hypocalcaemia and hyperphosphataemia even in the presence of high circulating levels of biologically active parathyroid hormone.
<b>5A50.Y</b>	<b>Other specified hypoparathyroidism</b>
<b>5A50.Z</b>	<b>Hypoparathyroidism, unspecified</b>
<b>5A51</b>	<b>Hyperparathyroidism</b> Hyperparathyroidism refers to overproduction of parathormone and is most frequently due to a tumour in one of the parathyroid glands. It may also occur in response to low calcium levels, as encountered in various situations such as vitamin D deficiency or chronic kidney disease. Hyperparathyroidism results in weakening of the bones through loss of calcium. <b>Exclusions:</b> Adult osteomalacia (FB83.2) infantile and juvenile osteomalacia (5B57.0)
<b>5A51.0</b>	<b>Primary hyperparathyroidism</b> Primary hyperparathyroidism is a condition with enhanced PTH secretion and high circulatory PTH level caused by abnormal parathyroid pathology such as adenoma, hyperplasia and cancer. Primary hyperparathyroidism usually causes hypercalcaemia by enhanced PTH actions.

<b>5A51.1</b>	<b>Secondary hyperparathyroidism</b> Secondary hyperparathyroidism is a condition with enhanced parathyroid hormone (PTH) secretion and high circulatory PTH level caused by metabolic changes such as hypocalcaemia, hyperphosphataemia and low 1,25-dihydroxyvitamin D.
<b>Coding Note:</b>	Code also the causing condition
	<b>Exclusions:</b> secondary hyperparathyroidism of renal origin (GB90.4)
<b>5A51.2</b>	<b>Familial hypocalciuric hypercalcaemia</b> Familial Hypocalciuric Hypercalcaemia (FHH) or benign familial hypercalcaemia is an autosomal dominant disorder of calcium metabolism that is often asymptomatic and that is biologically characterised by a significant but moderate hypercalcaemia. Serum levels of parathyroid hormone are normal or slightly increased, and urinary calcium excretion is relatively low for hypercalcaemia. CASR, GNA11 and AP2S1 have been identified as causative genes.
<b>5A51.Y</b>	<b>Other specified hyperparathyroidism</b>
<b>5A51.Z</b>	<b>Hyperparathyroidism, unspecified</b>
<b>5A5Y</b>	<b>Other specified disorders of the parathyroids or parathyroid hormone system</b>
<b>5A5Z</b>	<b>Disorders of the parathyroids or parathyroid hormone system, unspecified</b>

#### Disorders of the pituitary hormone system (5A60-5A6Z)

Clinical status with increased, decreased, or dysregulated secretion of pituitary hormones, which is caused by a variety of tumourous, non-tumourous, and genetic disorders.

<b>5A60</b>	<b>Hyperfunction of pituitary gland</b> A disease characterised by hypersecretion of adenohypophyseal hormones such as growth hormone, prolactin, thyrotropin, luteinising hormone, follicle stimulating hormone or adrenocorticotropic hormone.  Clinical status with excessive production of one or more pituitary hormones, which is mostly caused by hormone-producing pituitary adenomas.
	<b>Exclusions:</b> Nelson syndrome (5A70.3) overproduction of pituitary ACTH (5A70.0) overproduction of thyroid-stimulating hormone (5A02) Cushing syndrome (5A70) Multiple endocrine neoplasia type 1 (2F7A.0) Multiple endocrine neoplasia type 4 (2F7A.0)

<b>5A60.0</b>	<b>Acromegaly or pituitary gigantism</b> Acromegaly is an acquired disorder related to excessive production of growth hormone (GH) and characterised by progressive somatic disfigurement (mainly involving the face and extremities) and systemic manifestations. The main clinical features are broadened extremities (hands and feet), widened thickened and stubby fingers, and thickened soft tissue. The disease also has rheumatologic, cardiovascular, respiratory and metabolic consequences which determine its prognosis. In the majority of cases, acromegaly is related to a pituitary adenoma, either purely GH-secreting (60%) or mixed. Transsphenoidal surgery is often the first-line treatment. When surgery fails to correct GH/IGF-I hypersecretion, medical treatment with somatostatin analogs and/or radiotherapy can be used.
	<b>Inclusions:</b> Overproduction of growth hormone
	<b>Exclusions:</b> constitutional gigantism (5B12) increased secretion from endocrine pancreas of growth hormone-releasing hormone (5A40-5A4Z) Constitutional tall stature (5B12)
<b>5A60.1</b>	<b>Hyperprolactinaemia</b> Increased peripheral blood levels of prolactin often associated with galactorrhoea, sometimes associated with normal ovarian function, but often resulting in a spectrum of ovulatory dysfunction varying between short luteal phase (inadequate preovulatory follicular development), anovulatory cycles, amenorrhoea and hypogonadotropic hypogonadism
	<b>Coded Elsewhere:</b> Prolactinoma of pituitary gland (2F37.Y)
<b>5A60.2</b>	<b>Syndrome of inappropriate secretion of antidiuretic hormone</b> Syndrome of inappropriate antidiuretic hormone (ADH) secretion (SIADH) is characterised by continued ADH secretion, leading to hyponatraemia, hypoosmolality and natriuresis. Exact prevalence is unknown. The disease has been described in all age groups. SIADH is often associated with tumours, pulmonary disease, central nervous system disorders or exposure to drugs. Occasionally, it is found in patients with adrenal, thyroid or pituitary insufficiency. The disorder is caused by gain-of-function mutations in the gene encoding the vasopressin V2 receptor. Fluid restriction is the most common treatment. The outcome is related to the underlying and associated disorders.
<b>5A60.20</b>	Nephrogenic syndrome of inappropriate antidiuresis
<b>5A60.2Y</b>	Other specified syndrome of inappropriate secretion of antidiuretic hormone
<b>5A60.2Z</b>	Syndrome of inappropriate secretion of antidiuretic hormone, unspecified
<b>5A60.3</b>	<b>Central precocious puberty</b> Central precocious puberty is defined as the onset of pubertal changes before 8 years of age in girls and before 9.5 years of age in boys due to the overproduction of gonadotropin-releasing hormone (GnRH) by the hypothalamus. It may be idiopathic with no apparent cause (90% of cases in girls, 50% of cases in boys) or secondary to a lesion (tumour or malformation) in the hypothalamus. Other causes may include traumatic brain injury, or genetic disorders, affecting behavioural and psychological development, and final body height.

- 5A60.Y**           **Other specified hyperfunction of pituitary gland**
- 5A60.Z**           **Hyperfunction of pituitary gland, unspecified**
- 5A61**           **Hypofunction or certain other specified disorders of pituitary gland**  
 Clinical status with disordered function of the pituitary gland without excessive pituitary hormone production, which is caused by a variety of diseases
- Inclusions:**       Postprocedural hypopituitarism (5D43)  
                          Craniopharyngioma (2A00)
- Coded Elsewhere:** Non-secreting pituitary adenoma (2F37.0)
- 5A61.0**           **Hypopituitarism**  
 A disorder manifesting a deficiency or decrease of one or more pituitary hormones, which is caused by a variety of diseases such as tumour, trauma/surgery, irradiation, inflammation and haemorrhage/infarction.
- Inclusions:**       pituitary cachexia  
                          pituitary short stature
- Coded Elsewhere:** Prader-Willi syndrome (LD90.3)  
                          Argonz-del Castillo Syndrome (5A60.1)
- 5A61.1**           **Adrenocorticotrophic hormone deficiency**  
 Deficiency of adrenocorticotrophic hormone (ACTH) resulting in functional hypocortisolism. Includes deficiency of corticotropin releasing hormone (CRH, CRF).
- 5A61.2**           **Gonadotropin deficiency**  
 Deficiency of Luteinizing Hormone (LH), Follicle Stimulating Hormone (FSH) resulting in hypogonadism (male and female). Includes deficiency of Gonadotropin Releasing Hormone (GnRH, LHRH).
- Inclusions:**       Ovarian dysfunction (5A80)  
                          Testicular hypofunction (5A81.1)
- 5A61.3**           **Growth hormone deficiency**  
 Deficiency of growth hormone in children, adolescents and adults. Includes deficiency of growth hormone releasing hormone (GHRH) and excess of central somatostatin, leading to growth hormone deficiency. Includes idiopathic, inborn and acquired forms of growth hormone deficiency.
- Inclusions:**       Hypopituitarism (5A61.0)
- 5A61.4**           **Thyroid stimulating hormone deficiency**  
 Deficiency of thyroid stimulating hormone (TSH), leading to secondary (pituitary) or tertiary (hypothalamic) hypothyroidism. Includes deficiency of TSH releasing hormone (TRH).
- 5A61.40**          Acquired central hypothyroidism  
 Central Hypothyroidism is a condition where the thyroid gland produces too little or no thyroid hormone, induced by dysfunction of either hypothalamus or pituitary.

- 5A61.41** Congenital central hypothyroidism
- 5A61.4Y** Other specified thyroid stimulating hormone deficiency
- 5A61.4Z** Thyroid stimulating hormone deficiency, unspecified
- 5A61.5** **Central diabetes insipidus**  
Central diabetes insipidus (CDI) is a hypothalamus-pituitary disease characterised by polyuria and polydipsia due to a vasopressin (AVP) deficiency. The condition may be associated with deficient secretion of antidiuretic hormone (ADH) and is most frequently idiopathic (possibly due to autoimmune injury to the ADH-producing cells), or may be induced by trauma, pituitary surgery, or hypoxic or ischaemic encephalopathy.  
**Inclusions:** ADH - [antidiuretic hormone secretion] deficiency  
**Exclusions:** Nephrogenic diabetes insipidus (GB90.4A)
- 5A61.6** **Oxytocin deficiency**  
Isolated oxytocin deficiency or oxytocin deficiency in combination with anterior and/or posterior pituitary deficiencies.
- 5A61.Y** **Other specified hypofunction or disorders of pituitary gland**
- 5A6Z** **Disorders of the pituitary hormone system, unspecified**
- Disorders of the adrenal glands or adrenal hormone system (5A70-5A7Z)
- Coded Elsewhere:** Gonadotropin deficiency (5A61.2)  
Growth hormone deficiency (5A61.3)  
Thyroid stimulating hormone deficiency (5A61.4)  
Oxytocin deficiency (5A61.6)  
Adrenal incidentaloma (2F37.Y)
- 5A70** **Cushing syndrome**  
Cushing syndrome results from excess of corticosteroid hormones in the body due to overstimulation of the adrenal glands by excessive amounts of the hormone ACTH, secreted either by a tumor of the pituitary gland (Cushing's disease) or by a malignant tumour in the lung or elsewhere. Symptoms include weight gain, reddening of the face and neck, excess growth of body and facial hair, raised blood pressure, loss of mineral from the bones (osteoporosis), raised blood glucose levels, and sometimes mental disturbances.
- 5A70.0** **Pituitary-dependent Cushing disease**  
Pituitary-dependent Cushing disease is caused by a pituitary tumour, generally benign (adenoma) but rarely malignant (carcinoma), which secretes adrenocorticotropin (ACTH) autonomously, leading to hypercortisolism. The condition is associated with increased morbidity and mortality that can be mitigated by treatments that result in sustained endocrine remission. Transsphenoidal pituitary surgery (TSS) remains the mainstay of treatment for this disease but requires considerable neurosurgical expertise and experience in order to optimize patient outcomes.

- 5A70.1** **Ectopic ACTH syndrome**
- 5A70.2** **Pseudo-Cushing syndrome**  
This is a condition in which patients display the signs, symptoms, and abnormal hormone levels seen in Cushing's syndrome. However, pseudo-Cushing's syndrome is not caused by a problem with the hypothalamic-pituitary-adrenal axis as Cushing's is; it is an idiopathic condition.
- 5A70.3** **Nelson syndrome**
- 5A70.Y** **Other specified Cushing syndrome**
- 5A70.Z** **Cushing syndrome, unspecified**
- 5A71** **Adrenogenital disorders**  
Disorders of the reproductive system resulting from pathologic androgen production secondary to abnormalities in cortisol and/or aldosterone production
- 5A71.0** **46,XX disorders of sex development induced by androgens of fetal origin**  
This refers to 46,XX disorders of sex development induced by any natural or synthetic compound, usually a steroid hormone, that stimulates or controls the development and maintenance of male characteristics in vertebrates by binding to androgen receptors, of fetal origin.
- 5A71.00** **Glucocorticoid resistance**  
Glucocorticoid resistance is a rare genetic endocrine condition characterised by generalised, partial, target tissue resistance to glucocorticoids. The clinical spectrum of the condition is broad, ranging from asymptomatic to severe cases of hyperandrogenism, fatigue and/or mineralocorticoid excess.
- 5A71.01** **Congenital adrenal hyperplasia**  
Congenital adrenal hyperplasia (CAH) refers to a group of conditions associated with either complete (classical form) or partial (non-classical) anomalies in the biosynthesis of adrenal hormones. The condition is characterised by insufficient production of cortisol, or of aldosterone (classical form with salt wasting), associated with overproduction of adrenal androgens. In the classical form, metabolic decompensation (dehydration with hyponatraemia, hyperkalaemia and acidosis associated with mineralocorticoid deficiency, and hypoglycaemia associated with glucocorticoid deficiency) may be life-threatening from the neonatal period onwards. Genital variations may be noted at birth in affected females. Chronic hyperandrogenism may lead to accelerated growth during childhood, but advanced bone maturation may lead to a deficit in final height. Adults tend to be overweight and metabolic disturbances, bone anomalies and fertility problems may also be present. Non-classical forms are associated with later onset, during the peri- or postpubertal period, and manifest with signs of hyperandrogenism (acne, hirsutism, menstrual problems and infertility).
- 5A71.0Y** **Other specified 46,XX disorders of sex development induced by androgens of fetal origin**
- 5A71.0Z** **46,XX disorders of sex development induced by androgens of fetal origin, unspecified**

- 5A71.1** **46,XX disorders of sex development induced by androgens of maternal origin**  
This refers to 46,XX disorders of sex development induced by any natural or synthetic compound, usually a steroid hormone, that stimulates or controls the development and maintenance of male characteristics in vertebrates by binding to androgen receptors, of maternal origin.
- 5A71.Y** **Other specified adrenogenital disorders**
- 5A71.Z** **Adrenogenital disorders, unspecified**
- 5A72** **Hyperaldosteronism**
- 5A72.0** **Primary hyperaldosteronism**
- 5A72.1** **Secondary hyperaldosteronism**
- Coding Note:** Code also the causing condition
- 5A72.Z** **Hyperaldosteronism, unspecified**
- 5A73** **Hypoaldosteronism**  
**Exclusions:** Congenital adrenal hyperplasia (5A71.01)
- 5A74** **Adrenocortical insufficiency**  
A condition in which the adrenal glands do not produce adequate amounts of steroid hormones, primarily cortisol. It may also include impaired production of aldosterone (a mineralocorticoid), which regulates sodium conservation, potassium secretion, and water retention and also accompanies impaired production of adrenal androgens.  
**Coded Elsewhere:** Neonatal haemorrhage originating in adrenal gland (KA83.4)  
X-linked adrenoleukodystrophy (5C57.1)
- 5A74.0** **Acquired adrenocortical insufficiency**  
This is a acquired condition in which the adrenal glands do not produce adequate amounts of steroid hormones, primarily cortisol; but may also include impaired production of aldosterone (a mineralocorticoid), which regulates sodium conservation, potassium secretion, and water retention.  
**Exclusions:** Amyloidosis (5D00)  
**Coded Elsewhere:** Adrenocorticotrophic hormone deficiency (5A61.1)  
Tuberculous Addison disease (1B12.3)
- 5A74.1** **Adrenal crisis**  
Adrenal crisis is a life-threatening condition that indicates severe adrenal insufficiency caused by insufficient levels of cortisol.  
**Coded Elsewhere:** Waterhouse-Friderichsen syndrome (1C1C.1)
- 5A74.Y** **Other specified adrenocortical insufficiency**
- 5A74.Z** **Adrenocortical insufficiency, unspecified**

**5A75**

**Adrenomedullary hyperfunction**

Idiopathic overstimulation of the adrenal medulla resulting in pathologic epinephrine/norepinephrine-mediated sympathetic output

**5A76**

**Certain specified disorders of adrenal gland**

**5A76.0**

**Premature adrenarche**

Premature development of pubic and/or axillary hair without central or peripheral precocious puberty. Children show premature clinical and/or laboratory signs of androgen action without estrogen action.

**Exclusions:**      Central precocious puberty (5A60.3)

                        Congenital adrenal hyperplasia (5A71.01)

                        Peripheral precocious puberty (5A92)

**5A76.Y**

**Other specified disorders of adrenal gland**

**5A7Z**

**Disorders of the adrenal glands or adrenal hormone system, unspecified**

Disorders of the gonadal hormone system (5A80-5A8Z)

Gonad has a capability to produce androgen and estrogen under the control by hypothalamic–pituitary–gonadal axis. Gonadal dysfunction is caused by either insufficient actions of gonadotropin or resistance to gonadotropin.

**5A80**

**Ovarian dysfunction**

Pathological processes of the ovary.

**Exclusions:**      isolated gonadotropin deficiency (5A61.0)

                        Postprocedural ovarian failure (5D44)

**Coded Elsewhere:** Premature ovarian failure (GA30.6)

                        Hirsutism associated with hyperandrogenaemia (ED72.1)

                        Ovarian hyperstimulation syndrome (GA32.0)

                        HAIR-AN syndrome (5A44)

**5A80.0**

**Clinical hyperandrogenism**

Presence of hirsutism, acne or androgenic alopecia (scalp hair loss in women)

**5A80.1**

**Polycystic ovary syndrome**

Condition defined by the presence of at least 2 of the following 3 criteria: oligo/anovulation; clinical or biochemical signs of hyperandrogenism; presence of polycystic ovaries as identified by ultrasound.

**Inclusions:**      Sclerocystic ovary syndrome

**Exclusions:**      Polycystic ovary NOS (5A80.2)

<b>5A80.2</b>	<b>Polycystic ovary</b> Ovary with increased size (> 7 mL) and stromal volume, and with increased number of follicles (12 or more measuring 2-9 mm in diameter), that may be present in women with PCOS, but also in women with normal ovulatory function and normal fertility (unilaterally or bilaterally).
	<b>Exclusions:</b> Polycystic ovary syndrome (5A80.1)
<b>5A80.3</b>	<b>Anovulation</b> lack of ovulation in the last 12 months, leading to amenorrhea, irregular or infrequent cycles
<b>5A80.4</b>	<b>Oligo-ovulation</b> Oligo-ovulation (less than 4 ovulations in the last 12 months) not related to described categories of endocrine dysfunction. Excludes anovulation related to PCOS, hyperprolactinaemia or amenorrhea.
<b>5A80.5</b>	<b>Diminished ovarian reserve</b> Condition characterised by ovaries with lower number of oocytes than expected for female chronologic age, marked by biochemical abnormalities (increased serum FSH levels, decreased serum AMH levels) and/or ultrasound findings (low antral follicle count) associated with ovarian ageing, reduced response to ovarian stimulation, and female infertility
<b>5A80.Y</b>	<b>Other specified ovarian dysfunction</b>
<b>5A80.Z</b>	<b>Ovarian dysfunction, unspecified</b>
<b>5A81</b>	<b>Testicular dysfunction or testosterone-related disorders</b>
	<b>Exclusions:</b> isolated gonadotropin deficiency (5A61.0) Klinefelter syndrome (LD50.3) Postprocedural testicular hypofunction (5D45) Azoospermia (GB04.0) Oligospermia (GB04)
	<b>Coded Elsewhere:</b> 46,XY gonadal dysgenesis (LD2A.1) Testicular agenesis (LD2A.2) 46,XY disorder of sex development due to a defect in testosterone metabolism (LD2A.3) 46,XY disorder of sex development due to androgen resistance (LD2A.4) 46, XY disorders of sex development (LD2A.Z)
<b>5A81.0</b>	<b>Testicular hyperfunction</b> A hypersecretion of testicular hormones.
	<b>Exclusions:</b> McCune-Albright syndrome (FB80.0)

<b>5A81.1</b>	<b>Testicular hypofunction</b>
	In pre-puberty, a disorder characterised by atrophied testes and sterility, abnormal height and absence of secondary sex characteristics. In post-puberty, a disorder characterised by depressed sexual function, loss of sex drive and sterility, muscle weakness and osteoporosis (due to loss of the androgen anabolic effect).
<b>5A81.Y</b>	<b>Other specified testicular dysfunction or testosterone-related disorders</b>
<b>5A81.Z</b>	<b>Testicular dysfunction or testosterone-related disorders, unspecified</b>
<b>5A8Z</b>	<b>Disorders of the gonadal hormone system, unspecified</b>

Certain disorders of puberty (5A90-5A9Z)

**Exclusions:** Central precocious puberty (5A60.3)

<b>5A90</b>	<b>Disorder of puberty due to oestrogen resistance</b>
-------------	--

<b>5A91</b>	<b>Delayed puberty</b>
-------------	------------------------

This is when an organism has passed the usual age of onset of puberty with no physical or hormonal signs that it is beginning. Puberty may be delayed for several years and still occur normally, in which case it is considered constitutional delay, a variation of healthy physical development. Delay of puberty may also occur due to malnutrition, many forms of systemic disease, or to defects of the reproductive system (hypogonadism) or the body's responsiveness to sex hormones.

**Inclusions:** Delayed sexual development

Constitutional delay of puberty

<b>5A92</b>	<b>Peripheral precocious puberty</b>
-------------	--------------------------------------

Precocious puberty without activation of the GnRH-gonadotropin axis. It includes gonadal tumours with sex hormone production and it may be part of McCune-Albright's syndrome.

**Inclusions:** Precocious menstruation

**Exclusions:** female heterosexual precocious pseudopuberty (5A71)

male isosexual precocious pseudopuberty (5A71)

Central precocious puberty (5A60.3)

Congenital adrenal hyperplasia (5A71.01)

**Coded Elsewhere:** Testotoxicosis (5A81.0)

short stature achondroplastic (LD24.00)

renal short stature (GB61)

pituitary related short stature (5A61.0)

**Coded Elsewhere:** Short stature due to growth hormone resistance (5A61.0)

**5B12**

### **Constitutional tall stature**

Constitutional (familial) tall stature, a variant of the normal pattern of childhood growth and development, is defined as a condition in which the height of an individual is more than 2 SD above the corresponding mean height for a normal subject of the same age and gender. Distinguishing features are a family history of tall stature and lack of dimorphism or other clinical features suggesting pathologic causes of abnormally rapid growth.

**Inclusions:** Constitutional gigantism

**5B1Y**

### **Other specified endocrine disorders, not elsewhere classified**

---

**5B3Y**      **Other specified endocrine diseases**

**5B3Z**      **Endocrine diseases, unspecified**

### Nutritional disorders (5B50-5C3Z)

Nutritional disorders in all their forms result from imbalances (excess or deficiency) in energy and/or specific macro and micronutrients. They occur when the intake of essential macronutrients and micronutrients does not meet or exceeds the metabolic demands for those nutrients. Metabolic demands vary with age and other physiological conditions, they are also affected by environmental circumstances, including poor hygiene and sanitation, which lead to diarrhea and other infections.

**Coded Elsewhere:** Nutritional or toxic disorders of the nervous system (8D40-8D4Z)

#### Undernutrition (5B50-5B7Z)

Undernutrition is a condition in which the body's requirements are unmet due to underconsumption or to impaired absorption and use of nutrients. It can be produced by lack of access to food, or as a consequence of illness. Undernutrition commonly refers to a deficit in energy intake, but can also refer to deficiencies of specific nutrients, and can be either acute or chronic.

**Inclusions:**      Malnutrition NOS

**Exclusions:**      slim disease (1C62.3)

starvation (NF07.0)

Intestinal malabsorption (DA96.0)

Anorexia Nervosa (6B80)

**5B54**      **Underweight in adults**

Body mass index (BMI) <18.5 kg/m<sup>2</sup>

**5B55**

### **Vitamin A deficiency**

Vitamin A deficiency (VAD) is defined as a state in which tissue concentrations of vitamin A are low enough to have adverse health consequences even if there is no evidence of clinical xerophthalmia. The term xerophthalmia encompasses the clinical spectrum of ocular manifestations of vitamin A deficiency, from milder stages of night blindness and Bitot's spots, to potentially blinding stages of corneal xerosis, ulceration and necrosis (keratomalacia). In addition to the specific signs and symptoms of xerophthalmia and the risk of irreversible blindness, nonspecific symptoms include increased morbidity and mortality, poor reproductive health, increased risk of anaemia, and contributions to slowed growth and development.

**Inclusions:** Hypovitaminosis A

**Coded Elsewhere:** Acquired vitamin A deficiency anaemia (3A03.5)

**5B55.0**

### **Vitamin A deficiency with night blindness**

Night blindness (poor adaptation to darkness) is generally the earliest manifestation of vitamin A deficiency. In mild cases, night blindness is apparent only after photic stress. Affected children no longer move around after dusk and prefer to sit in a secure corner, often unable to find their food or toys. Night blindness of recent onset in a preschool child is practically pathognomonic of vitamin A deficiency. All patients respond rapidly to therapy with vitamin A, usually within 48 hours.

**5B55.1**

### **Vitamin A deficiency with conjunctival xerosis**

In conjunctival xerosis the epithelium of the conjunctiva is transformed from the normal columnar to the stratified squamous type, with a resultant loss of goblet cells, formation of a granular cell layer, and keratinization of the surface. Clinically, these changes are expressed as marked dryness or unwettability, the affected area appearing roughened, with fine droplets or bubbles on the surface, rather than smooth and glistening. Conjunctival xerosis first appears in the temporal quadrant, as an isolated oval or triangular patch adjacent to the limbus in the interpalpebral fissure. It is almost always present in both eyes.

**5B55.2**

### **Vitamin A deficiency with conjunctival xerosis and Bitot's spots**

Generalised conjunctival xerosis suggests advanced vitamin A deficiency. The entire conjunctiva appears dry, roughened, and corrugated, sometimes skin-like. In some individuals keratin and saprophytic bacilli accumulate on the xerotic surface, giving it a foamy or cheesy appearance. Such lesions are known as Bitot's spot. With treatment active conjunctival xerosis and Bitot's spot begin to resolve within 2-5 days. Most will disappear within 2 weeks, though a significant proportion of temporal lesions may persist, in shrunken form, for months.

**5B55.3**

**Vitamin A deficiency with corneal xerosis**

Clinically, the cornea develops classical xerosis, a hazy, lustreless, dry appearance, first apparent near the inferior limbus. Many children have characteristic superficial punctate lesions of the inferior-nasal aspects of their cornea that stain brightly with fluorescein. Early in the disease they are visible only through a slit-lamp examination. With more severe disease the punctate lesions become more numerous and spread upwards over the central cornea, and the corneal stroma becomes oedematous. Thick, keratinized plaques resembling Bitot's spot may form on the corneal surface. These are often densest in the interpalpebral zone. With treatment, these corneal plaques peel off, sometimes leaving superficial erosion which quickly heals. Corneal xerosis responds within 2-5 days to vitamin A therapy, the cornea regaining its normal appearance in 1-2 weeks.

**5B55.4**

**Vitamin A deficiency with corneal ulceration or keratomalacia**

Ulceration/keratomalacia indicates permanent destruction of part or all of the corneal stroma, resulting in permanent structural alteration. Ulcers are classically round to oval "punched-out" defects, as if a trephine or cork-borer had been applied to the eye. The surrounding cornea is generally xerotic but otherwise clear, and typically lacks the grey, infiltrated appearance of ulcers of bacterial origin. There may be more than one ulcer. Small ulcers are almost invariably confined to the periphery of the cornea, especially its inferior and nasal aspects. The ulceration may be shallow, but is commonly deep. Perforations become plugged with iris, thereby preserving the anterior chamber. In more advanced disease the necrotic stroma sloughs, leaving a large ulcer or descemetocele. As with smaller ulcers, this is usually peripheral and heals as a dense, white, adherent leukoma. With therapy, superficial ulcers often heal with surprisingly little scarring; deeper ulcers, especially perforations, form dense peripheral adherent leukomas.

**5B55.5**

**Vitamin A deficiency with xerophthalmic scars of cornea or blindness**

Xerophthalmia or "dry eye" remains the most important cause of childhood blindness in many developing countries. Healed sequelae of prior corneal disease related to vitamin A deficiency include opacities or scars of varying density (nebula, macula, leukoma), weakening and outpouching of the remaining corneal layers (staphylooma and descemetocele) and, where loss of intraocular contents has occurred, phthisis bulbi, a scarred shrunken globe. Such end-stage lesions are not specific for xerophthalmia and may arise from numerous other conditions, notably trauma and infection.

**5B55.Y**

**Vitamin A deficiency with other specified manifestations**

**5B55.Z**

**Vitamin A deficiency, unspecified**

**5B56**

**Vitamin C deficiency**

This condition groups several clinical consequences secondary to vitamin C deficiency with scurvy being the most severe presentation. The populations at risk of vitamin C deficiency are those for whom the fruit and vegetable supply is minimal. Epidemics of scurvy are associated with famine and war, when food supply is small and irregular. Children fed predominantly heat-treated (ultra-high-temperature or pasteurized) milk or unfortified formulas and not receiving fruits and fruit juices are at significant risk for symptomatic disease.

<b>5B56.0</b>	<b>Scurvy</b> Scurvy is a disease caused by a lack of vitamin C (ascorbic acid) in the diet. Vitamin C plays a central role in collagen and ground-substance formation, metabolism of aromatic amino acids (phenylalanine, tyrosine), reduction of folic acid to folinic acid and a broad range of biochemical redox reactions. Clinical features include perifollicular haemorrhages, ecchymoses, swollen bleeding gums, stomatitis and epistaxis.  <i>Coded Elsewhere:</i> Scorbutic anaemia (3A03.2)
<b>5B56.Y</b>	<b>Other specified vitamin C deficiency</b>
<b>5B56.Z</b>	<b>Vitamin C deficiency, unspecified</b>
<b>5B57</b>	<b>Vitamin D deficiency</b> Vitamin D is a fat-soluble vitamin contained naturally in very few foods, added to milk, available as a supplement, and produced endogenously with exposure to sunlight. Vitamin D deficiency can be caused by inadequate intake due to dietary factors (e.g., special diets (veganism), lactose intolerance or allergies) and/or limited exposure to sunlight due to geographic location, sun avoidance, or shiftwork. Severe deficiency results in disordered bone modelling called rickets in childhood (open growth plates), and osteomalacia in adults (fused growth plates).
<b>5B57.0</b>	<b>Vitamin D deficiency rickets</b> Rickets is a disease of growing bone that is due to unmineralized matrix at the growth plates and occurs in children only before fusion of the epiphyses. There are many causes of rickets, including vitamin D disorders, calcium deficiency, phosphorous deficiency, and distal renal tubular acidosis. With the increased survival rate of very low birthweight infants, rickets in this age group has become a significant problem.
<b>5B57.1</b>	<b>Vitamin D deficiency osteomalacia</b> Osteomalacia is a disorder of defective mineralization of newly formed osteoid at sites of bone turnover. Several different disorders cause osteomalacia via mechanisms that result in hypocalcaemia, hypophosphatemia, or direct inhibition of the mineralization process. Severe vitamin D deficiency, secondary to inadequate dietary intake, lack of sun exposure, gastric bypass or malabsorption (celiac disease), is the most common cause of osteomalacia in adults.
<b>5B57.Y</b>	<b>Other specified vitamin D deficiency</b>
<b>5B57.Z</b>	<b>Vitamin D deficiency, unspecified</b>

**5B58**

### **Vitamin E deficiency**

Vitamin E deficiency is a condition that causes haemolysis and/or neurologic manifestations. Red blood cell fragility occurs and can produce a haemolytic anaemia. Neuronal degeneration produces peripheral neuropathies, ophthalmoplegia, and destruction of posterior columns of spinal cord. Neurologic disease is frequently irreversible if deficiency is not corrected early enough. Vitamin E deficiency may also contribute to the haemolytic anaemia and retrorenal fibroplasia seen in premature infants.

**Coded Elsewhere:** Acquired vitamin E deficiency anaemia (3A03.6)

Dementia due to vitamin E deficiency (6D85.Y)

**5B59**

### **Vitamin K deficiency**

Vitamin K is necessary for the synthesis of clotting factors II, VII, IX, and X, and deficiency of vitamin K can result in clinically significant bleeding. Vitamin K deficiency typically affects infants, who experience a transient deficiency related to inadequate intake, or patients of any age who have decreased vitamin K absorption. Mild vitamin K deficiency can affect long-term bone and vascular health.

**Coded Elsewhere:** Neonatal vitamin K deficiency (KA8F)

**5B5A**

### **Vitamin B1 deficiency**

Vitamin B1 deficiency manifests itself principally with changes involving the nervous system (polyneuritis and paralysis of the peripheral nerves), the cardiovascular system (cardiac insufficiency and generalised oedema), and also the gastrointestinal tract (constipation, vomiting, and abdominal pain).

**5B5A.0**

#### **Beriberi**

The clinical picture of Beriberi is usually divided into a dry (neuritic) type and a wet (cardiac) type. The disease is wet or dry depending on the amount of fluid which accumulates in the body due to factors like cardiac function, kidney lesions and others; even though the exact cause for this oedema has never been successfully explained. Many cases of thiamine deficiency show a mixture of the two main features and are more properly termed thiamine deficiency with cardiopathy and peripheral neuropathy. The infant shows signs of cyanosis and an acute cardiac attack can follow with the infant usually dying within 2 to 4 hours. The common age for this form of the deficiency disease is one month up through the third month. This type of deficiency responds very dramatically to thiamine.

**5B5A.00**

Dry beriberi

Neuritic form of Beri Beri

**5B5A.01**

Wet beriberi

Cardiac form of Beri Beri.

Beriberi, unspecified

<b>5B5A.1</b>	<b>Wernicke-Korsakoff Syndrome</b> A thiamine-deficiency syndrome characterised by symmetric hyperaemic lesions of the brainstem, hypothalamus, thalamus, and mammillary bodies with glial proliferation, capillary dilatation, and perivascular haemorrhage. The syndrome is manifested by a confusional state, disorientation, ophthalmoplegia, nystagmus, diplopia, and ataxia (Wernicke encephalopathy), with severe loss of memory for recent events and confabulation (the invention of accounts of events to cover the loss of memory) (Korsakoff psychosis) occurring following recovery. Defective binding of thiamine diphosphate by transketolase has been found. It appears that the disorder is of autosomal recessive inheritance but is expressed as clinical disease only in the event of thiamine deficiency.
<b>Coding Note:</b>	Chronic alcohol use may be associated with thiamine deficiency, but alcohol may also have effects on the brain via other mechanisms. This category should be used to describe cognitive symptoms due to chronic alcohol use if there is evidence of thiamine deficiency.
	<b>Exclusions:</b> Amnestic disorder due to use of alcohol (6D72.10)
<b>5B5A.10</b>	<b>Wernicke encephalopathy</b> Wernicke's encephalopathy is an acute neuropsychiatric syndrome characterised by nystagmus, ophthalmoplegia, changes in the mental status, an uncoordinated gait and truncal ataxia. Wernicke's encephalopathy is usually accompanied or followed by Korsakoff's syndrome/Korsakoff's dementia (a continuum of Wernicke's encephalopathy characterised by severe memory defects, ataxia, apathy, disorientation, confabulations, hallucinations, paralysis of muscles controlling the eye and coma). The disorder results from a deficiency in vitamin B1, and mostly occurs in adults with a history of alcohol abuse or in patients with AIDS.
<b>5B5A.11</b>	<b>Korsakoff syndrome</b> A disease of the nervous system, caused by deficiency of vitamin B1 in the brain. This disease commonly follows Wernicke encephalopathy, and may present with inability to form new memories, amnesia, confabulation, or hallucinations.
<b>Coding Note:</b>	Chronic alcohol use may be associated with thiamine deficiency, but alcohol may also have effects on the brain via other mechanisms. This category should be used to describe cognitive symptoms due to chronic alcohol use if there is evidence of thiamine deficiency.
	<b>Exclusions:</b> Amnestic disorder due to use of alcohol (6D72.10)
<b>5B5A.1Y</b>	<b>Other specified Wernicke-Korsakoff Syndrome</b>
<b>Coding Note:</b>	Chronic alcohol use may be associated with thiamine deficiency, but alcohol may also have effects on the brain via other mechanisms. This category should be used to describe cognitive symptoms due to chronic alcohol use if there is evidence of thiamine deficiency.
<b>5B5A.1Z</b>	<b>Wernicke-Korsakoff Syndrome, unspecified</b>
<b>Coding Note:</b>	Chronic alcohol use may be associated with thiamine deficiency, but alcohol may also have effects on the brain via other mechanisms. This category should be used to describe cognitive symptoms due to chronic alcohol use if there is evidence of thiamine deficiency.

<b>5B5A.Z</b>	<b>Vitamin B1 deficiency, unspecified</b>

**5B5B**

### **Vitamin B2 deficiency**

The signs of riboflavin deficiency are sore throat, hyperaemia, oedema of the pharyngeal and oral mucous membranes, cheilosis, angular stomatitis, glossitis, seborrheic dermatitis, and normochromic normocytic anaemia associated with pure red cell cytoplasia of the bone marrow. The major cause of hyporiboflavinosis is inadequate dietary intake as a result of limited food supply, which is sometimes exacerbated by poor food storage or processing. Children in developing countries will commonly demonstrate clinical signs of riboflavin deficiency during periods of the year when gastrointestinal infections are prevalent. Decreased assimilation of riboflavin also results from abnormal digestion, such as that which occurs with lactose intolerance.

**Inclusions:** Riboflavin deficiency

**Coded Elsewhere:** Acquired riboflavin deficiency anaemia (3A03.41)

**5B5C**

### **Vitamin B3 deficiency**

Niacin deficiency classically results in pellagra, which is a chronic wasting disease associated with a characteristic erythematous dermatitis that is bilateral and symmetrical, a dementia after mental changes including insomnia and apathy preceding an overt encephalopathy, and diarrhoea resulting from inflammation of the intestinal mucous surfaces. Pellagra occurs endemically in poorer areas of Africa, China and India.

**Inclusions:** niacin deficiency NOS

**5B5C.0**

#### **Pellagra**

Pellagra is a potentially life-threatening disorder due to niacin deficiency and is observed in malnourished individuals, especially alcoholics, and as a complication of isoniazid therapy. The diagnosis is often overlooked or delayed. Pellagra manifests as diarrhoea, dermatitis, dementia, which usually appear in this order. Gastrointestinal tract symptoms always precede skin involvement, which presents initially with a sunburn-like blistering erythema, typically affecting the dorsal surfaces of the hands, face, neck, arms, and feet. With time the skin becomes thickened, scaly and pigmented.

**5B5C.Y**

#### **Other specified vitamin B3 deficiency**

**5B5C.Z**

#### **Vitamin B3 deficiency, unspecified**

**5B5D**

### **Vitamin B6 deficiency**

A deficiency of vitamin B6 alone is uncommon because it usually occurs in association with a deficit in other B-complex vitamins. Hypovitaminosis B6 may often occur with riboflavin (vitamin B2) deficiency. The classical clinical symptoms of vitamin B6 deficiency are a seborrheic dermatitis, microcytic anaemia, epileptiform convulsions, and depression and confusion. Infants are especially susceptible to insufficient intakes, which can lead to epileptiform convulsions. Moreover, there is usually a decrease in circulating lymphocytes and sometimes a normocytic, microcytic, or sideroblastic anaemia as well. As is the case with other micronutrient deficiencies, vitamin B6 deficiency results in an impairment of the immune system. Several medical conditions can also affect vitamin B6 metabolism and thus lead to deficiency symptoms.

**Exclusions:** Pyridoxine-responsive sideroblastic anaemia, not elsewhere classified (3A72.1)

**Coded Elsewhere:** Acquired pyridoxine deficiency anaemia (3A03.40)

Pyridoxine dependent epilepsy with antiquitin mutations  
(8A61.0Y)

**5B5E**

### **Folate deficiency**

Nutritional deficiency of folate is common in people consuming a limited diet. This can be exacerbated by malabsorption conditions, including coeliac disease and tropical sprue. Pregnant women are at risk for folate deficiency because pregnancy significantly increases the folate requirement, especially during periods of rapid fetal growth (i.e. in the second and third trimester). During lactation, losses of folate in milk also increase the folate requirement. During pregnancy, there is an increased risk of fetal neural tube defects (NTDs), with risk increasing 10-fold as folate status goes from adequate to poor. Between days 21 and 27 post-conception, the neural plate closes to form what will eventually be the spinal cord and cranium. Spina bifida, anencephaly, and other similar conditions are collectively called NTDs. They result from improper closure of the spinal cord and cranium, respectively, and are the most common congenital abnormalities associated with folate deficiency.

**5B5F**

### **Vitamin B12 deficiency**

Vegetarianism and poverty-imposed near-vegetarianism are the most common causes of nutritional cobalamin insufficiency worldwide in all age groups. In such populations, low maternal cobalamin status is associated with adverse pregnancy outcomes (preterm birth, intrauterine growth retardation, early recurrent miscarriage), neural tube defects, reduced neurocognitive performance in children, accelerated bone turnover, and low bone mineral density with fractures. Insufficient cobalamin intake is also seen in breast-fed infants of mothers with pernicious anaemia.

**Inclusions:** cobalamin deficiency

cyanocobalamin deficiency

**Coded Elsewhere:** Vitamin B12 deficiency anaemia due to low intake (3A01.2)

Vitamin B12 deficiency anaemia due to intrinsic factor deficiency (3A01.3)

Vitamin B12 deficiency anaemia due to intestinal disease (3A01.4)

Drug-induced vitamin B12 deficiency anaemia (3A01.5)

Acquired vitamin B12 deficiency anaemia (3A01.Z)

Dementia due to vitamin B12 deficiency (6D85.Y)

**5B5G**

### **Biotin deficiency**

Isolated biotin deficiency is rare. Signs of biotin deficiency in humans have been demonstrated in individuals who consume raw egg white over long periods and in total parenteral nutrition (TPN) before biotin supplementation in patients with malabsorption. The clinical findings of biotin deficiency include dermatitis, conjunctivitis, alopecia, and central nervous system abnormalities. In adults fed raw egg white (which contains avidin, a protein that binds biotin with such high affinity that it renders it biounavailable) or receiving biotin-free TPN for months to years, thinning of hair, frequently with loss of hair colour, has been reported. Most adults with the deficiency demonstrate a red, scaly, skin rash, frequently around the eyes, nose, and mouth. Most of the adults have neurological symptoms, including depression, lethargy, hallucinations, and paraesthesia of the extremities.

**5B5H**

### **Pantothenic acid deficiency**

Pantothenic deficiency is rare: only reported as a result of feeding semisynthetic diets or an antagonist to the vitamin. Experimental, isolated deficiency in humans produces fatigue, abdominal pain, vomiting, insomnia, and paraesthesiae of the extremities.

**5B5J**

### **Choline deficiency**

Choline deficiency is rare. Individuals fed with total parenteral nutrition (TPN) solutions lacking choline develop fatty liver and liver damage.

**5B5K**

### **Mineral deficiencies**

**Exclusions:** Disorders of mineral absorption or transport (5C64)

**Coded Elsewhere:** Hypokalaemia (5C77)

Hypomagnesaemia (5C64.41)

**5B5K.0**

**Iron deficiency**

Iron deficiency is a state in which there is insufficient iron to maintain the normal physiological function of blood, brain and muscles. It can exist in the absence of anaemia if it has not lasted long enough or if it has not been severe enough to cause the haemoglobin concentration to fall below the threshold for the specific sex and age group. Iron deficiency is the most common nutritional deficiency.

**Exclusions:** Iron deficiency anaemia (3A00)

**Coded Elsewhere:** Acquired iron deficiency anaemia due to blood loss (3A00.0)

Acquired iron deficiency anaemia due to low intake (3A00.1)

Acquired iron deficiency anaemia due to decreased absorption  
(3A00.2)

Acquired iron deficiency anaemia due to increased  
requirement (3A00.3)

Acquired iron deficiency anaemia (3A00.Z)

Dementia due to iron deficiency (6D85.Y)

**5B5K.1**

**Calcium deficiency**

Hypocalcaemia is defined as a total serum calcium concentration of less than 8.4 mg/dl (2.1 mmol/litre) or an ionized calcium concentration of less than 4.48 mg/dl (1.12 mmol/litre). There are numerous causes of hypocalcaemia, chronic kidney disease being the most common cause. Other causes are: vitamin D deficiency, disorders associated with acquired or genetic hypoparathyroidism, including intravenous bisphosphonate therapy, post-thyroidectomy and post-parathyroidectomy, and acute pancreatitis. Hypocalcaemia may be associated with a spectrum of clinical manifestations, ranging from few symptoms if the hypocalcaemia is mild, to life-threatening seizures, refractory heart failure, or laryngospasm if it is severe. In addition to severity, the rate of development of hypocalcaemia and chronicity determine the clinical manifestations.

**Exclusions:** Disorders of calcium metabolism (5C64.5)

**Coded Elsewhere:** Neonatal hypocalcaemia (KB61.2)

Neonatal osteopenia (KB61.3)

Myopathy due to calcium deficiency (8D40.2)

**5B5K.10**

Tetany due to acute calcium deficiency

The hallmark of acute hypocalcaemia is tetany, which is characterised by neuromuscular irritability. The symptoms of tetany may be mild (peri-oral numbness, paresthesias of the hands and feet, muscle cramps) or severe (carpopedal spasm, laryngospasm, and focal or generalised seizures, which must be distinguished from the generalised tonic muscle contractions that occur in severe tetany). Other patients have less specific symptoms such as fatigue, hyperirritability, anxiety, and depression, and some patients, even with severe hypocalcaemia, have no neuromuscular symptoms. Factors that determine the variation in frequency and severity of symptoms include acid-base status (hypocalcaemia and alkalosis act synergistically to cause tetany), hypomagnesaemia, and potassium balance.

**5B5K.1Y**

Other specified calcium deficiency

**5B5K.1Z**

Calcium deficiency, unspecified

**5B5K.2****Zinc deficiency**

The clinical features of severe zinc deficiency in humans are growth retardation, delayed sexual and bone maturation, skin lesions, diarrhoea, alopecia, impaired appetite, increased susceptibility to infections mediated via defects in the immune system, and the appearance of behavioural changes. The effects of marginal or mild zinc deficiency are less clear. A reduced growth rate and impairments of immune defence are so far the only clearly demonstrated signs of mild zinc deficiency in humans. Other effects, such as impaired taste and wound healing, which have been claimed to result from a low zinc intake, are less consistently observed.

**Coded Elsewhere:** Neonatal nutritional zinc deficiency (5C64.21)

**5B5K.3****Iodine deficiency**

Iodine deficiency disorders (IDD), caused mainly by a low dietary supply of iodine, refer to all of the consequences of iodine deficiency in a population that can be prevented by ensuring that the population has an adequate intake of iodine. Iodine deficiency is the most frequent cause of preventable brain damage in childhood.

**Coded Elsewhere:** Iodine-deficiency-related thyroid disorders or allied conditions (5A00.1)

Acquired hypothyroidism (5A00.2)

Congenital hypothyroidism due to iodine deficiency (5A00.04)

**5B5K.4****Fluorine deficiency**

A condition caused by a deficiency of fluoride. Low fluorine concentrations in an individual's dental plaque and enamel may result in an increased risk for dental caries at any age. Fluorine deficiencies might also show negative effects on human's bone health.

**5B5K.5****Sodium chloride deficiency**

Sodium and chloride are usually found together in most foods as sodium chloride, also termed salt. For that reason, the effects of sodium and chloride deficiency are considered together. Deficiency can be caused by poor intake or increased losses (e.g., diuretics increase the urinary excretion of water, sodium, and chloride; in cystic fibrosis the sodium and chloride content of sweat is very high; gastrointestinal losses are associated with diarrhoeal diseases, emesis, ostomy output and other causes).

**5B5K.6****Copper deficiency**

Dietary deficiency is rare; it has been observed in premature and low birthweight infants fed exclusively a cow's milk diet and in individuals on long-term total parenteral nutrition without copper. Clinical manifestations include depigmentation of skin and hair, neurologic disturbances, leukopenia, hypochromic microcytic anaemia, and skeletal abnormalities.

**Coded Elsewhere:** Copper deficiency anaemia (3A03.3)

- 5B5K.7      Selenium deficiency**  
Selenium deficiency is rare but has been observed in individuals on long-term total parenteral nutrition lacking selenium. Clinical manifestations of deficiency arising from such situations are uncommon and poorly defined. They include muscular weakness and myalgia with, in several instances, the development of congestive heart failure. The importance of selenium for thyroid hormone metabolism is evident from changes in the T<sub>3</sub>–T<sub>4</sub> ratio which develop after relatively mild selenium depletion in infants and elderly subjects.
- 5B5K.8      Chromium deficiency**  
Deficiency in humans is only described in long-term total parenteral nutrition patients receiving insufficient chromium. Hyperglycaemia or impaired glucose tolerance occurs. Elevated plasma free fatty acid concentrations, neuropathy, encephalopathy, and abnormalities in nitrogen metabolism are also reported.
- 5B5K.9      Manganese deficiency**
- 5B5K.A      Molybdenum deficiency**  
Molybdenum functions as a cofactor for a limited number of enzymes in humans: sulphite oxidase, xanthine oxidase and aldehyde oxidase. A rare severe metabolic defect causing molybdenum cofactor deficiency and preventing these enzymes from being synthesized has been described. Few infants with such defects survive the first days of life, and those who survive have severe neurological abnormalities. Although molybdenum deficiency related to a dietary deficiency is extremely rare in humans, it has been described in long-term total parenteral nutrition as being secondary to the administration of sulphite. Symptoms include: tachycardia, headache, night blindness, irritability and coma. Biochemical changes can consist of elevated plasma and methionine concentration, low serum uric acid concentration, high urinary thiosulfate and low urinary uric acid and sulphate levels.
- 5B5K.B      Vanadium deficiency**  
A biological role of vanadium in humans has not yet been identified.
- 5B5K.Y      Other specified mineral deficiency**
- 5B5K.Z      Mineral deficiency, unspecified**

## Sequelae of malnutrition or certain specified nutritional deficiencies (5B60-5B6Z)

This refers to sequelae of malnutrition or certain specified nutritional deficiencies.

- 5B60      Sequelae of protein-energy malnutrition**  
This refers to a pathological condition resulting from protein-energy malnutrition.
- 5B61      Sequelae of vitamin A deficiency**  
This refers to a pathological condition resulting from vitamin A deficiency.
- 5B62      Sequelae of vitamin C deficiency**  
This refers to a pathological condition resulting from vitamin C deficiency.

**5B63**

**Sequelae of rickets**

Bowed legs and/or arms, knock-knees, deformities of the thoracic cage and/or spine and/or skeletal dysplasia secondary to chronic or advanced rickets

**5B6Y**

**Other specified sequelae of malnutrition or certain specified nutritional deficiencies**

**5B6Z**

**Sequelae of malnutrition or certain specified nutritional deficiencies, unspecified**

**5B70**

**Essential fatty acid deficiency**

Deficiency of EFA (linoleic acid, linolenic acid, arachidonic acid, docosapentaenoic acid, docosahexaenoic acid and eicosapentaenoic acid) can be caused by deficient intake, particularly, in rapidly growing infants (as preterm infants), in patients receiving parenteral nutrition without an adequate source of EFA, and in diseases with fat malabsorption. Clinical findings are: dermatitis, alopecia, and thrombocytopenia. The role of EFA during pregnancy and lactation has been highlighted, and the role of long-chain n-3 fatty acids as structural components for the development of the retinal function and central nervous system is now accepted. The prenatal period is a time of increased risk for omega-3 deficiency, as maternal tissue stores tend to decline as they are used for the developing fetus. Deficiency of n-3 EFA can affect growth, and cognitive and visual function in infants. The characteristic signs of deficiency attributed to the n-6 fatty acids are scaly skin rash, increased transepidermal water loss, reduced growth, and elevation of the plasma ratio of eicosatrienoic acid: arachidonic acid. EFA deficiency in special populations has been linked to hematologic disturbances and diminished immune response. Long-chain n-3 and n-6 fatty acids are essential nutrients and also, as part of the overall fat supply may affect the prevalence and severity of cardiovascular disease, diabetes, cancer and age-related functional decline.

**Protein deficiency**

**5B7Y**

**Other specified undernutrition**

**5B7Z**

**Unspecified undernutrition**

Overweight, obesity or specific nutrient excesses (5B80-5C1Z)

Overweight or obesity (5B80-5B81.Z)

**5B80**

**Overweight or localised adiposity**

Overweight is a condition characterized by excessive adiposity. Overweight is assessed by the body mass index (BMI), which is a surrogate marker of adiposity calculated as weight (kg)/height<sup>2</sup> (m<sup>2</sup>). The BMI categories for defining overweight vary by age and gender in infants, children and adolescents. For adults, overweight (or pre-obesity) is defined by a BMI ranging from 25.00 to 29.99 kg/m<sup>2</sup>. Localized adiposity is a condition characterized by accumulation of adipose tissue in specific regions of the body independently of BMI.

<b>5B80.0</b>	<b>Overweight</b> Overweight is a condition characterized by excessive adiposity. Overweight is assessed by the body mass index (BMI), which is a surrogate marker of adiposity calculated as weight (kg)/height <sup>2</sup> (m <sup>2</sup> ). The BMI categories for defining overweight vary by age and gender in infants, children and adolescents. For adults, overweight (or pre-obesity) is defined by a BMI ranging from 25.00 to 29.99 kg/m <sup>2</sup> .
<b>5B80.00</b>	Overweight in infants, children or adolescents Overweight is a condition characterised by excessive adiposity. Overweight is assessed by the body mass index (BMI), which is a surrogate marker of adiposity calculated as weight (kg)/height <sup>2</sup> (m <sup>2</sup> ). In infants, children and adolescents, BMI categories for defining overweight vary by age and gender based on WHO growth charts. Children 0 to 5 years are overweight if weight-for-length/height or BMI-for-age is above 2 and less than or equal to 3 standard deviations of the median of the WHO Child Growth Standards. Children 5 to 19 years are overweight if BMI-for-age is above 1 and less than or equal to 2 standard deviations of the median of WHO Growth Reference for School-aged Children and Adolescents.
<b>5B80.01</b>	Overweight in adults
<b>5B80.0Z</b>	Overweight, unspecified
<b>5B80.1</b>	<b>Localised adiposity</b> A condition characterised by accumulation of adipose tissue in specific regions of the body. <b>Coded Elsewhere:</b> Benign symmetrical lipomatosis (EF02.1)
<b>5B81</b>	<b>Obesity</b> Obesity is a chronic complex disease defined by excessive adiposity that can impair health. It is in most cases a multifactorial disease due to obesogenic environments, psycho-social factors and genetic variants. In a subgroup of patients, single major etiological factors can be identified (medications, diseases, immobilization, iatrogenic procedures, monogenic disease/genetic syndrome). Body mass index (BMI) is a surrogate marker of adiposity calculated as weight (kg)/height <sup>2</sup> (m <sup>2</sup> ). The BMI categories for defining obesity vary by age and gender in infants, children and adolescents. For adults, obesity is defined by a BMI greater than or equal to 30.00 kg/m <sup>2</sup> and there are three levels of severity in recognition of different management options. <b>Coded Elsewhere:</b> Obesity hypoventilation syndrome (7A42.0) Syndromes with obesity as a major feature (LD29)
<b>5B81.0</b>	<b>Obesity due to energy imbalance</b> Obesity is a chronic complex disease defined by excessive adiposity that can impair health. It is in most cases a multifactorial disease due to obesogenic environments, psycho-social factors and genetic variants. In a subgroup of patients, single major etiological factors can be identified (diseases, immobilization, iatrogenic procedures, monogenic disease/genetic syndrome).

<b>5B81.00</b>	Obesity in children or adolescents  In infants, children and adolescents, BMI categories for defining obesity vary by age and gender based on WHO growth charts. Children 0 to 5 years have obesity if weight-for-length/height or BMI-for-age is above 3 standard deviations of the median of the WHO Child Growth Standards.  Children aged 5 to 19 years have obesity if BMI-for-age is above 2 standard deviations of the median of WHO Growth Reference for School-aged Children and Adolescents.
<b>5B81.01</b>	Obesity in adults  Obesity is defined as a body mass index (BMI) greater than or equal to 30.00 kg/m <sup>2</sup> . There are three levels of severity in recognition of different management options.
<b>5B81.1</b>	<b>Drug-induced obesity</b>
<b>5B81.Y</b>	<b>Other specified obesity</b>
<b>5B81.Z</b>	<b>Obesity, unspecified</b>

### Certain specified nutrient excesses (5B90-5B9Z)

Any disease caused by an excess of specific nutrients. Confirmation is by blood test.

<b>5B90</b>	<b>Vitamin excesses</b>
<b>5B90.0</b>	<b>Hypervitaminosis A</b>  Because vitamin A is fat soluble and can be stored, primarily in the liver, routine consumption of large amounts of vitamin A over a period of time can result in toxic symptoms, including liver damage, bone abnormalities and joint pain, alopecia, headaches, vomiting, and skin desquamation. Hypervitaminosis A appears to be due to abnormal transport and distribution of vitamin A and retinoids caused by overloading of the plasma transport mechanisms. Very high single doses can cause transient acute toxic symptoms that may include bulging fontanelles in infants; headaches in older children and adults; and vomiting, diarrhoea, loss of appetite, and irritability in all age groups. Rarely does toxicity occur from ingestion of food sources of preformed vitamin A. When this occurs, it usually results from very frequent consumption of liver products.
	<b>Coded Elsewhere:</b> Pseudotumour Cerebri related to Hypervitaminosis A (8D41.2)
<b>5B90.1</b>	<b>Hypercarotenaemia</b>  Excessive intake of carotenoids is not associated with toxicity but can cause yellow coloration of the skin that disappears when intake is reduced. This disorder is especially likely to occur in children with liver disease, diabetes mellitus or hypothyroidism, and in those who do not have enzymes that metabolize carotenoids.

5B90.2	<b>Hypervitaminosis D</b> Hypervitaminosis D is secondary to excessive intake of vitamin D. It can occur with long-term high intake or with a substantial, acute ingestion. Excess amounts result in abnormally high concentrations of calcium and phosphate in the serum. The signs and symptoms of vitamin D intoxication are secondary to hypercalcaemia. Gastrointestinal manifestations include nausea, vomiting, constipation, abdominal pain and pancreatitis. Possible cardiac findings are hypertension, decreased Q-T interval and arrhythmias. The central nervous system effects of hypercalcaemia include lethargy, hypotonia, confusion, disorientation, depression, psychosis, hallucinations and coma. Hypercalcaemia impairs renal concentrating mechanisms, which can lead to polyuria, dehydration and hypernatremia. Hypercalcaemia can also lead to acute renal failure, nephrolithiasis and nephrocalcinosis, which can result in chronic renal insufficiency. Deaths are usually associated with arrhythmias or dehydration.
5B90.3	<b>Megavitamin-B6 syndrome</b> A disease caused by an excess of vitamin B6. This disease is characterised by progressive sensory ataxia, diminished or absent tendon reflexes, and impaired sense of touch, temperature and pain. Confirmation is by blood test.
5B90.Y	<b>Other specified vitamin excess</b>
5B90.Z	<b>Unspecified vitamin excesses</b>
<b>5B91</b>	<b>Mineral excesses</b> <i>Coded Elsewhere:</i> Hyperkalaemia (5C76) Iron overload diseases (5C64.10)
5B91.0	<b>Hypercalcaemia</b> Hypercalcaemia is a condition caused by increased calcium levels. The higher the calcium levels and the faster its level rises, the more severe will be the symptoms. When present, symptoms are caused by dehydration secondary to urinary losses of calcium, water and other electrolytes, and to an increase in membrane potential caused by the elevation in extracellular fluid ionized calcium concentration. Patients with moderate to severe hypercalcaemia often complain of nausea and vomiting, symptoms likely related to dehydration as well as to the effects of the hypercalcaemia on central nervous system function. Because hypercalcaemia tends to hyperpolarize membranes, a range of neurologic and neuromuscular signs and symptoms can occur. Patients with mild hypercalcaemia often complain of fatigue, depressed mood and asthenia. Gastrointestinal motility is impaired; this commonly results in constipation. <i>Coded Elsewhere:</i> Myopathy due to hypercalcaemia (8D41.1)

- 5B91.1 Zinc excess**  
Adverse effects associated with chronic intake of supplemental zinc include suppression of immune response, decrease in high-density lipoprotein (HDL) cholesterol and reduced copper status. Acute adverse effects of excess zinc include epigastric pain, nausea, vomiting, loss of appetite, abdominal cramps, diarrhoea, headaches and gastrointestinal distress.
- Coded Elsewhere:** Myelopathy due to excess of zinc (8D41.Y)
- 5B91.2 Sodium chloride excess**  
The main adverse effect of increased sodium chloride in the diet is increased blood pressure, which is a major risk factor for cardiovascular-renal diseases. However, evidence from a variety of studies, including observational studies and clinical trials, has demonstrated heterogeneity in the blood pressure responses to sodium intake. Those individuals with the greatest reductions in blood pressure in response to decreased sodium intake are termed “salt sensitive”.
- 5B91.3 Fluorine excess**  
The primary adverse effects associated with chronic, excess fluoride intake are enamel and skeletal fluorosis. Enamel fluorosis is a dose-response effect caused by fluoride intake during the pre-eruptive development of teeth. The development of skeletal fluorosis and its severity is directly related to the level and duration of exposure. The clinical signs in advanced stages may include dose-related calcification of ligaments, osteosclerosis, exostoses, possibly osteoporosis of long bones, muscle wasting and neurological defects due to hypercalcification of vertebrae.
- Coded Elsewhere:** Dental enamel fluorosis (DA07.0)
- 5B91.4 Aluminium excess**  
Patients receiving long-term parenteral nutrition are at increased risk of aluminium toxicity because of bypass of the gastrointestinal tract during parenteral nutrition infusion. Complications of aluminium toxicity include metabolic bone disease, aluminium-associated encephalopathy in adults and impaired neurological development in preterm infants.
- 5B91.5 Manganese excess**  
Manganese toxicity in humans is a well-recognised occupational hazard for people who inhale manganese dust. High concentrations of circulating manganese as a result of total parenteral nutrition have also been associated with manganese toxicity. People with chronic liver disease have neurological pathology and behavioural signs of manganese neurotoxicity, probably because elimination of manganese in bile is impaired. The most prominent effect is central nervous system pathology, especially in the extra-pyramidal motor system. The lesions and symptoms are similar to those of Parkinson's disease.
- Coded Elsewhere:** Dementia or parkinsonism due to manganese toxicity (6D84.Y)
- 5B91.Y Other specified mineral excess**
- 5B91.Z Unspecified mineral excess**

### Metabolic disorders (5C50-5D2Z)

**Exclusions:** androgen resistance syndrome (LD2A.4)  
Congenital adrenal hyperplasia (5A71.01)  
Ehlers-Danlos syndrome (LD28.1)  
Hereditary haemolytic anaemia due to enzyme deficiency (3A10)  
Marfan syndrome (LD28.01)  
5-alpha-reductase deficiency (5A81.1)

**Coded Elsewhere:** Cystic fibrosis (CA25)  
Metabolic disorders following abortion, ectopic or molar pregnancy (JA05.5)

### Inborn errors of metabolism (5C50-5C5Z)

Inborn errors of metabolism comprise a large class of genetic diseases involving disorders of metabolism. The majority are due to defects of single genes that code for enzymes that facilitate conversion of various substances (substrates) into others (products).

**Exclusions:** Disorders of lipoprotein metabolism or certain specified lipidaemias  
(5C80-5C8Z)

#### **5C50 Inborn errors of amino acid or other organic acid metabolism**

##### **5C50.0 Phenylketonuria**

Phenylketonuria is a hereditary metabolic disease, characterised by deficiency of phenylalanine hydroxylase, an enzyme necessary for the transformation of phenylalanine into tyrosine. Untreated, phenylketonuria leads to mental retardation, sometimes profound, as well as hypopigmentation. Dietary phenylalanine restriction allows patients to lead almost normal lives.

##### **5C50.00 Classical phenylketonuria**

Classical phenylketonuria is a severe form of phenylketonuria (PKU) an inborn error of amino acid metabolism characterised in untreated patients by severe intellectual deficit and neuropsychiatric complications.

- 5C50.01** Nonclassical phenylketonuria  
Mild phenylketonuria is a rare form of phenylketonuria (PKU), an inborn error of amino acid metabolism, characterised by symptoms of PKU of mild to moderate severity.
- 5C50.02** Embryofetopathy due to maternal phenylketonuria  
Maternal phenylalaninaemia refers to developmental anomalies that may occur in offspring of women affected by phenylketonuria (PKU), and include fetal development disorders, including microcephaly, intrauterine growth retardation, and subsequent intellectual deficit, and embryo development disorders such as heart defects (usually conotruncal), corpus callosum agenesis, neuronal migration disorders, facial dysmorphism and more rarely cleft palate, tracheo-oesophageal abnormalities.
- 5C50.0Y** Other specified phenylketonuria
- 5C50.0Z** Phenylketonuria, unspecified
- 5C50.1** Disorders of tyrosine metabolism  
**Coded Elsewhere:** Transitory tyrosinaemia of newborn (KB63.4)  
Autosomal recessive dopa-responsive dystonia (8A02.11)  
Oculocutaneous albinism type 1A (EC23.20)  
Oculocutaneous albinism type 1B (EC23.20)
- 5C50.10** Alkaptonuria  
Alkaptonuria is characterised by the accumulation of homogentisic acid (HGA) and its oxidised product benzoquinone acetic acid (BQA), leading to a darkening of the urine when it is left exposed to air, grey-blue colouration of the eye sclerae and the ear helix (ochronosis), and a disabling joint disease involving both the axial and peripheral joints (ochronotic arthropathy).
- 5C50.11** Tyrosinaemia type 1  
Tyrosinemia type 1 is an inborn error of amino acid metabolism characterised by hepatorenal manifestations. The early-onset acute form of the disorder manifests between 15 days and 3 months after birth with hepatocellular necrosis. Septicaemia is a frequent complication. Renal tubular dysfunction occurs and is associated with phosphate loss and hypophosphatemic rickets. A later onset form has also been described and manifests with vitamin-resistant rickets caused by renal tubular dysfunction.
- 5C50.12** Tyrosinaemia type 2  
Tyrosinemia type 2 is an inborn error of tyrosine metabolism characterised by hypertyrosinemia with oculocutaneous manifestations (eye redness, photophobia, excessive tearing and pain, palmoplantar hyperkeratosis) and, in some cases, intellectual deficit.
- 5C50.1Y** Other specified disorders of tyrosine metabolism
- 5C50.1Z** Disorders of tyrosine metabolism, unspecified

- 5C50.2** **Disorders of histidine metabolism**  
**Coded Elsewhere:** Formiminoglutamic aciduria (3A02.Y)
- 5C50.20** Histidinaemia  
Histidinemia is a disorder of histidine metabolism caused by a defect in histidase, and seems to be benign in most affected individuals.
- 5C50.21** Urocanic aciduria  
This is an autosomal recessive metabolic disorder caused by a deficiency of the enzyme urocanase. It is a secondary disorder of histidine metabolism.
- 5C50.2Y** Other specified disorders of histidine metabolism
- 5C50.2Z** Disorders of histidine metabolism, unspecified
- 5C50.3** **Disorders of tryptophan metabolism**  
**Exclusions:** Hartnup disease (5C60)
- 5C50.4** **Disorders of lysine or hydroxylysine metabolism**  
**Exclusions:** Refsum disease (5C57.1)  
Zellweger syndrome (5C57.0)  
Glutaryl-CoA dehydrogenase deficiency (5C50.E1)
- 5C50.5** **Disorders of the gamma-glutamyl cycle**  
**Coded Elsewhere:** Haemolytic anaemia due to glutathione synthetase deficiency (3A10.0Y)  
Haemolytic anaemia due to gamma-glutamylcysteine synthetase deficiency (3A10.0Y)
- 5C50.6** **Disorders of serine metabolism**
- 5C50.7** **Disorders of glycine metabolism**
- 5C50.70** Glycine encephalopathy  
Isolated nonketotic hyperglycinemia is an inborn disorder of glycine metabolism whose onset is generally neonatal with coma, severe hypotonia, myoclonic seizures, and microcephaly, usually progressing to severe intellectual deficit and tetrapyrimal syndrome.
- 5C50.71** Sarcosinaemia  
Sarcosinaemia is a metabolic disorder characterised by an increased concentration of sarcosine in plasma and urine due to sarcosine dehydrogenase deficiency. Prevalence has been estimated at 1:28,000 to 1:350,000 in newborn screening programs. Sarcosinaemia is most probably a benign condition without significant clinical problems. It is transmitted in an autosomal recessive manner. Mutations in the gene for sarcosine dehydrogenase, located on chromosome 9q34, have been associated with this deficiency.
- 5C50.7Y** Other specified disorders of glycine metabolism
- 5C50.7Z** Disorders of glycine metabolism, unspecified

- 5C50.8**           **Disorders of proline or hydroxyproline metabolism**
- 5C50.9**           **Disorders of ornithine metabolism**
- Coded Elsewhere:** Hyperornithinaemia-hyperammonaemia-homocitrullinuria (5C50.AY)
- Ornithine carbamoyltransferase deficiency (5C50.AY)
- 5C50.A**           **Disorders of urea cycle metabolism**
- Exclusions:** Disorders of ornithine metabolism (5C50.9)  
Lysinuric protein intolerance (5C60)
- 5C50.A0**          Argininosuccinic aciduria  
 Argininosuccinic aciduria is an autosomal recessive inherited deficiency of argininosuccinate lyase, an enzyme involved in the urea cycle that leads to severe hyperammonemic coma in neonates or, in childhood, to hypotonia, growth failure, anorexia and chronic vomiting or behavioural disorders. Onset can also occur later with hyperammonemic coma or behavioural disorders that simulate psychiatric disorders.
- 5C50.A1**          Carbamoylphosphate synthetase deficiency  
 Carbamyl phosphate synthetase deficiency is an urea cycle disorder strictly limited to the liver and intestine that results in congenital hyperammonemia and defective citrulline synthesis.
- 5C50.A2**          Argininaemia  
 Arginase deficiency is a rare autosomal recessive amino acid metabolism disorder characterised clinically by variable degrees of hyperammonemia, developing from about 3 years of age, and leading to progressive loss of developmental milestones and spasticity in the absence of treatment.
- 5C50.A3**          Citrullinaemia
- 5C50.AY**          Other specified disorders of urea cycle metabolism
- 5C50.AZ**          Disorders of urea cycle metabolism, unspecified
- 5C50.B**           **Disorders of methionine cycle or sulphur amino acid metabolism**
- Coded Elsewhere:** Hereditary megaloblastic anaemia due to transcobalamin deficiency (3A01.0)
- 5C50.C**           **Disorders of beta or omega amino acid metabolism**
- Exclusions:** 4-hydroxybutyric aciduria (5C50.E1)
- Coded Elsewhere:** Gamma aminobutyric acid transaminase deficiency (5C59.1)

<b>5C50.D</b>	<b>Disorders of branched-chain amino acid metabolism</b>
	<p><b>Exclusions:</b></p> <ul style="list-style-type: none"> <li>Methylmalonic acidaemia (5C50.E0)</li> <li>Propionic acidaemia (5C50.E0)</li> <li>Isovaleric acidaemia (5C50.E0)</li> <li>3-methylglutaconic aciduria (5C50.E0)</li> <li>Developmental delay due to 2-methylbutyryl-CoA dehydrogenase deficiency (5C50.E0)</li> <li>3-hydroxyisobutyric aciduria (5C50.E0)</li> </ul>
<b>5C50.D0</b>	Maple-syrup-urine disease  Maple syrup urine disease (MSUD) is a disorder of branched-chain amino acids metabolism. Four forms are described. The early onset classic form manifests after birth by lethargy, poor feeding and neurological signs of intoxication. Clinical course without treatment is characterised by deepening coma with maple syrup odour of urine. Subacute MSUD manifests later with encephalopathy, mental disability, major hypotonia, opisthotonus and cerebral atrophy with severe outcome. The intermittent form of MSUD may manifest at any age and presents with repeated ketoacidotic coma. Thiamine-responsive MSUD is a very rare form characterised by improvement of the biochemical profile with thiamine therapy.
<b>5C50.DY</b>	Other specified disorders of branched-chain amino acid metabolism
<b>5C50.DZ</b>	Disorders of branched-chain amino acid metabolism, unspecified
<b>5C50.E</b>	<b>Organic aciduria</b>  An inborn error of metabolism disrupting normal amino acid metabolism, particularly branched-chain amino acids, causing a buildup of acids, which are usually not present
<b>5C50.E0</b>	Classical organic aciduria  This a term used to classify a group of metabolic disorders which disrupt normal amino acid metabolism, particularly branched-chain amino acids, causing a buildup of acids which are usually not present.  <b>Coded Elsewhere:</b> Ketoacidosis due to beta-ketothiolase deficiency (5C50.DY)
<b>5C50.E1</b>	Cerebral organic aciduria  This is a term used to classify a group of metabolic disorders which disrupt normal amino acid metabolism, particularly branched-chain amino acids, causing a buildup of acids which are usually not present.
<b>5C50.EY</b>	Other specified organic aciduria
<b>5C50.EZ</b>	Organic aciduria, unspecified
<b>5C50.F</b>	<b>Disorders of peptide metabolism</b>  A condition which refers to inborn errors in peptide metabolism.
	<p><b>Exclusions:</b></p> <ul style="list-style-type: none"> <li>Disorders of gamma aminobutyric acid metabolism (5C59.1)</li> </ul>

<b>5C50.F0</b>	Polidase deficiency Polidase deficiency is a very rare inborn error of metabolism characterised by mild to severe skin lesions particularly on the face, palms, lower legs and soles, together with other variable features.
<b>5C50.F1</b>	Carnosinaemia Carnosinaemia is a very rare inherited disorder of the metabolism of peptides that presents with serum carnosinase deficiency, variable degrees of intellectual deficit, sometimes with seizures, while a few patients are asymptomatic.
<b>5C50.F2</b>	Homocarnosinosis Homocarnosinosis is a metabolic defect characterised by progressive spastic diplegia, intellectual deficit and retinitis pigmentosa. This extremely rare disorder has been reported in only one family, namely a woman and three of her children. The latter showed but their mother was symptom free. It is therefore uncertain whether there is a relationship between the biochemical defect and the clinical symptoms. Inheritance in the reported family seems to be autosomal dominant.
<b>5C50.FY</b>	Other specified disorders of peptide metabolism
<b>5C50.FZ</b>	Disorders of peptide metabolism, unspecified
<b>5C50.G</b>	<b>Trimethylaminuria</b> Trimethylaminuria is a metabolic disorder characterised by a body malodour similar to that of decaying fish.  <i>Inclusions:</i> Fish odour syndrome

<b>5C51.0</b>	<b>Disorders of the pentose phosphate pathway</b>  <i>Coded Elsewhere:</i> Haemolytic anaemia due to glucose-6-phosphate dehydrogenase deficiency (3A10.00)
<b>5C51.1</b>	<b>Disorders of glycerol metabolism</b>

- 5C51.2** **Disorders of glyoxylate metabolism**  
Primary hyperoxaluria, or oxalosis, is a rare metabolic disorder transmitted as an autosomal recessive disease, including both type 1, the most frequent, and type 2, extremely rare. Hyperoxaluria type 1 is due to a defect of the peroxysomal hepatic enzyme L-alanine: glyoxylate aminotransferase (AGT). Hyperoxaluria type 2 is extremely rare and is due to glycerate dehydrogenase deficiency.
- 5C51.20** Primary hyperoxaluria type 1  
Primary hyperoxaluria type 1 is a rare metabolic disorder due to a defect of the peroxysomal hepatic enzyme L-alanine: glyoxylate aminotransferase (AGT). The infantile form is characterised by chronic renal failure due to massive oxalate deposition. In other patients, urolithiasis develops with infections, haematuria, renal colic or acute renal failure due to complete obstruction. End-stage renal failure occurs before 15 years of age in half the cases and the resulting increase of circulating oxalate leads to its deposition in tissues causing cardiac conduction defects, hypertension, distal gangrene, and reduced joint mobility and pain.
- 5C51.2Y** Other specified disorders of glyoxylate metabolism
- 5C51.2Z** Disorders of glyoxylate metabolism, unspecified
- 5C51.3** **Glycogen storage disease**  
The term Glycogen storage disease characterises a group of heterogeneous diseases resulting from defects in the process of glycogen synthesis or breakdown within muscles, liver, and other cell types.
- 5C51.4** **Disorders of galactose metabolism**
- 5C51.40** Galactose-1-phosphate uridylyltransferase deficiency  
Classic galactosemia is a life-threatening metabolic disease with onset in the neonatal period. Infants usually develop feeding difficulties, lethargy, and severe liver disease.
- 5C51.41** Galactokinase deficiency  
Galactokinase deficiency is a rare mild form of galactosemia characterised by early onset of cataract and an absence of the usual signs of classic galactosemia, i.e. feeding difficulties, poor weight gain and growth, lethargy, and jaundice.
- 5C51.42** Glucose or galactose intolerance of newborn
- 5C51.4Y** Other specified disorders of galactose metabolism
- 5C51.4Z** Disorders of galactose metabolism, unspecified
- 5C51.5** **Disorders of fructose metabolism**  
This refers to disorders of the metabolism of fructose in the phosphorylation of fructose to fructose 1-phosphate by fructokinase, thus trapping fructose for metabolism in the liver.
- Coded Elsewhere:** Fructose malabsorption (5C61.40)

<b>5C51.50</b>	Hereditary fructose intolerance Hereditary fructose intolerance is an autosomal recessive disorder due to a deficiency of fructose-1-phosphate aldolase activity, which results in an accumulation of fructose-1-phosphate in the liver, kidney, and small intestine, and is characterised by severe abdominal pain, vomiting, and hypoglycaemia following ingestion of fructose or other sugars metabolised through fructose-1-phosphate.
	<b><i>Exclusions:</i></b> Fructose malabsorption (5C61.40)
<b>5C51.5Y</b>	Other specified disorders of fructose metabolism
<b>5C51.5Z</b>	Disorders of fructose metabolism, unspecified

<b>5C52.0</b>	<b>Inborn errors of fatty acid oxidation or ketone body metabolism</b>
	<b><i>Coded Elsewhere:</i></b> Adrenoleukodystrophy (8A44.1)
<b>5C52.00</b>	Disorders of carnitine transport or the carnitine cycle
<b>5C52.01</b>	Disorders of mitochondrial fatty acid oxidation
<b>5C52.02</b>	Disorders of ketone body metabolism <b><i>Coded Elsewhere:</i></b> Cytosolic acetoacetyl-CoA thiolase deficiency (5C50.DY)
<b>5C52.03</b>	Sjögren-Larsson syndrome Sjögren-Larsson syndrome is a neurocutaneous disorder caused by an inborn error of lipid metabolism and characterised by congenital ichthyosis, intellectual deficit, and spasticity.
<b>5C52.0Y</b>	Other specified inborn errors of fatty acid oxidation or ketone body metabolism
<b>5C52.0Z</b>	Inborn errors of fatty acid oxidation or ketone body metabolism, unspecified
<b>5C52.1</b>	<b>Inborn errors of sterol metabolism</b>
	<b><i>Coded Elsewhere:</i></b> X-linked ichthyosis (EC20.01)
<b>5C52.10</b>	Disorders of cholesterol synthesis <b><i>Coded Elsewhere:</i></b> Chondrodysplasia punctata, X-linked dominant (LD24.04) Greenberg dysplasia (LD24.04) Congenital hemidysplasia with ichthyosiform erythroderma and limbs defects (LD24.04) Hyperalphalipoproteinæmia due to cholesteryl ester transfer protein deficiency (5C80.3)

<b>5C52.11</b>	Bile acid synthesis defect with cholestasis Anomalies of bile acid synthesis are a group of sterol metabolism disorders due to enzyme deficiencies of bile acid synthesis in infants, children and adults, with variable manifestations that include cholestasis, neurological disease, and fat malabsorption. Eight inborn errors have been clearly identified, 7 of which lead to liver cholestasis and include: 3 $\beta$ -hydroxy-C27-steroid oxidoreductase deficiency (type 1), $\Delta$ 4-3-oxosteroid 5 $\beta$ -reductase deficiency (type 2), oxysterol 7 $\alpha$ -hydroxylase deficiency (type 3), 2-methylacyl-CoA racemase deficiency (type 4), bile acid CoA ligase deficiency, and cerebrotendinous xanthomatosis. Cholesterol 7 $\alpha$ -hydroxylase deficiency leads to hypercholesterolaemia without liver cholestasis.
<b>5C52.1Y</b>	Other specified inborn errors of sterol metabolism
<b>5C52.1Z</b>	Inborn errors of sterol metabolism, unspecified
<b>5C52.2</b>	<b>Neutral lipid storage disease</b> Neutral lipid storage disease (NLSD) refers to a group of diseases characterised by a deficit in the degradation of cytoplasmic triglycerides and their accumulation in cytoplasmic lipid vacuoles in most tissues of the body. The group is heterogeneous: NLSD with ichthyosis (NLSDI/Dorfman-Chanarin disease) and NLSD with myopathy (NLSDM/neutral lipid storage myopathy) can be distinguished.
<b>5C52.Y</b>	<b>Other specified inborn errors of lipid metabolism</b>
<b>5C52.Z</b>	<b>Inborn errors of lipid metabolism, unspecified</b>
<b>5C53</b>	<b>Inborn errors of energy metabolism</b>
<b>5C53.0</b>	<b>Disorders of pyruvate metabolism</b>
<b>5C53.00</b>	Pyruvate kinase deficiency This refers to an enzyme involved in glycolysis. It catalyzes the transfer of a phosphate group from phosphoenolpyruvate (PEP) to ADP, yielding one molecule of pyruvate and one molecule of ATP. <b>Coded Elsewhere:</b> Glycogen storage disease due to muscle pyruvate kinase deficiency (5C51.3) Haemolytic anaemia due to red cell pyruvate kinase deficiency (3A10.Y)
<b>5C53.01</b>	Lactate dehydrogenase deficiency This refers to a deficiency in the enzyme present in a wide variety of organisms, including plants and animals. This exists in four distinct enzyme classes. Two of them are cytochrome c-dependent enzymes, each acting on either D-lactate (EC 1.1.2.4) or L-lactate (EC 1.1.2.3). The other two are NAD(P)-dependent enzymes, each acting on either D-lactate (EC 1.1.1.28) or L-lactate (EC 1.1.1.27). This article is about the NAD(P)-dependent L-lactate dehydrogenase.
<b>5C53.02</b>	Pyruvate dehydrogenase complex deficiency Pyruvate dehydrogenase deficiency (PDHD) is a rare neurometabolic disorder characterised by a wide range of clinical signs with metabolic and neurological components of varying severity. Manifestations range from often fatal, severe, neonatal to later-onset neurological disorders.

- 5C53.03** Pyruvate carboxylase deficiency  
 This is a deficiency in the enzyme of the ligase class that catalyzes the (depending on the species) irreversible carboxylation of pyruvate to form oxaloacetate (OAA).
- 5C53.0Y** Other specified disorders of pyruvate metabolism
- 5C53.0Z** Disorders of pyruvate metabolism, unspecified
- 5C53.1** **Disorders of the citric acid cycle**
- 5C53.2** **Disorders of mitochondrial oxidative phosphorylation**  
 An inborn error of metabolism in cellular respiration (oxidative phosphorylation) in the mitochondria, where a series of enzymes catalyze the transfer of electrons to molecular oxygen and the generation of energy-storing ATP  
*Coded Elsewhere:* Neuropathy, ataxia, and retinitis pigmentosa (8C73.1)
- 5C53.20** Mitochondrial DNA depletion syndromes  
 The mitochondrial DNA (mtDNA) depletion syndrome (MDS) is a clinically heterogeneous group of mitochondrial disorders characterised by a reduction of the mtDNA copy number in affected tissues without mutations or rearrangements in the mtDNA. MDS is phenotypically heterogeneous, manifesting either as a hepatocerebral form, a myopathic form, a benign 'later-onset' myopathic form or a cardiomyopathic form.  
*Coded Elsewhere:* Childhood-onset autosomal dominant optic atrophy (9C40.8)
- 5C53.21** Multiple mitochondrial DNA deletion syndromes  
 This is the multiple DNA located in organelles called mitochondria, structures within eukaryotic cells that convert the chemical energy from food into a form that cells can use, adenosine triphosphate (ATP).  
*Coded Elsewhere:* Progressive external ophthalmoplegia, autosomal dominant (9C82.0)  
     Progressive external ophthalmoplegia, autosomal recessive (9C82.0)  
     Autosomal dominant optic atrophy plus syndrome (9C40.8)  
     Deafness - optic atrophy syndrome (LD2H.Y)  
     Autosomal dominant optic atrophy and cataract (9C40.8)
- 5C53.22** Coenzyme Q10 deficiency  
 This is a deficiency in a 1,4-benzoquinone, where Q refers to the quinone chemical group, and 10 refers to the number of isoprenyl chemical subunits in its tail. This oil-soluble, vitamin-like substance is present in most eukaryotic cells, primarily in the mitochondria. It is a component of the electron transport chain and participates in aerobic cellular respiration, generating energy in the form of ATP.  
*Coded Elsewhere:* Cerebellar atrophy - ataxia - seizures (LD90.Y)

<b>5C53.23</b>	Mitochondrial protein translation defects This refers to defects in the enzyme that belongs to the family of hydrolases, specifically those acting on acid anhydrides to catalyse transmembrane movement of substances.  <b>Coded Elsewhere:</b> Pontocerebellar hypoplasia type 6 (LD20.01) Mitochondrial myopathy with sideroblastic anaemia (3A72.0Y)
<b>5C53.24</b>	Leigh syndrome Leigh syndrome or subacute necrotizing encephalomyopathy is a progressive neurological disease defined by specific neuropathological features associating brainstem and basal ganglia lesions. Loss of motor milestones, hypotonia with poor head control, recurrent vomiting, and a movement disorder are common initial symptoms. Pyramidal and extrapyramidal signs, nystagmus, breathing disorders, ophthalmoplegia and peripheral neuropathy are often noted later. Epilepsy is relatively uncommon. Leigh syndrome has multiple causes, all of which imply a defect in aerobic energy production, ranging from the pyruvate dehydrogenase complex to the oxidative phosphorylation pathway.  <b>Coded Elsewhere:</b> Maternally inherited Leigh syndrome (8C73.Y)
<b>5C53.25</b>	Isolated ATP synthase deficiency
<b>5C53.2Y</b>	Other specified disorders of mitochondrial oxidative phosphorylation
<b>5C53.2Z</b>	Disorders of mitochondrial oxidative phosphorylation, unspecified
<b>5C53.3</b>	<b>Disorders of mitochondrial membrane transport</b> An inborn error of metabolism in proteins in the membranes of mitochondria, which serve to transport molecules and other factors such as ions into or out of the organelles
<b>5C53.30</b>	Mitochondrial substrate carrier disorders  <b>Coded Elsewhere:</b> Autosomal recessive sideroblastic anaemia, pyridoxine-refractory (3A72.00)
<b>5C53.31</b>	Mitochondrial protein import disorders This refers to disorders in the enzyme that belongs to the family of hydrolases, specifically those acting on acid anhydrides to catalyse transmembrane movement of substances.  <b>Coded Elsewhere:</b> Deafness-dystonia optic atrophy syndrome (8A02.12)
<b>5C53.3Y</b>	Other specified disorders of mitochondrial membrane transport
<b>5C53.3Z</b>	Disorders of mitochondrial membrane transport, unspecified
<b>5C53.4</b>	<b>Disorders of creatine metabolism</b> An inborn error of metabolism in creatine which serves as an energy shuttle between the mitochondrial sites of ATP production and the cytosol where ATP is utilized
<b>5C53.Y</b>	<b>Other specified inborn errors of energy metabolism</b>

- 5C53.Z**           **Inborn errors of energy metabolism, unspecified**
- 5C54**           **Inborn errors of glycosylation or other specified protein modification**  
Congenital Disorders of Glycosylation (CDG) syndromes are a group of glycoprotein synthesis disorders characterised by neurological manifestations that can be associated with multivisceral involvement. The CDG syndromes are associated with different enzymatic deficits.
- 5C54.0**           **Disorders of protein N-glycosylation**  
Congenital disorders involving defective N-glycosylation of proteins (the addition of glycans linked to the polypeptide chain by a beta-linkage between the anomeric carbon of N-acetylglucosamine and the amido group of L-asparagine).
- 5C54.1**           **Disorders of protein O-glycosylation**  
Congenital disorders involving defective O-linked glycosylation, which typically occurs via an alpha linkage of the glycan to the hydroxyl group of a serine or threonine residue on a protein  
*Coded Elsewhere:* Multiple osteochondromas (LD24.20)
- 5C54.2**           **Disorders of multiple glycosylation or other pathways**  
*Coded Elsewhere:* Hereditary inclusion body myositis (4A41.20)
- 5C54.Y**           **Other specified congenital disorders of glycosylation and protein modification**

- 5C55**           **Inborn errors of purine, pyrimidine or nucleotide metabolism**  
*Exclusions:*       Xeroderma pigmentosum (LD27.1)  
                        Calculus of kidney (GB70.0)
- 5C55.0**           **Disorders of purine metabolism**  
*Coded Elsewhere:* Primary gout (FA25.0)  
                        Haemolytic anaemia due to adenosine deaminase excess (3A10.1)  
                        Immunodeficiency due to purine nucleoside phosphorylase deficiency (4A01.1Y)  
                        Severe combined immunodeficiency T- B- due to adenosine deaminase deficiency (4A01.10)
- 5C55.00**           Xanthinuria

<b>5C55.01</b>	Lesch-Nyhan syndrome Lesch-Nyhan syndrome (LNS) is the most severe form of hypoxanthine-guanine phosphoribosyltransferase (HPRT) deficiency, a hereditary disorder of purine metabolism, and is associated with uric acid overproduction (UAO), neurological troubles, and behavioural problems. Patients are normal at birth. Psychomotor delay becomes evident within 3 to 6 months with a delay in head support and sitting, hypotonia and athetoid movements. Sandy urine in diapers or crystalluria with urinary tract obstruction are common forms of presentation. Patients usually show mild to moderate intellectual deficit. Diagnosis is suspected when psychomotor delay occurs in a patient with elevated UA in blood and urine. Undetectable HPRT enzyme activity in peripheral blood or in intact cells (erythrocyte, fibroblast) and molecular genetic testing confirm the diagnosis. Inheritance is X-linked recessive.
<b>5C55.0Y</b>	Other specified disorders of purine metabolism
<b>5C55.0Z</b>	Disorders of purine metabolism, unspecified
<b>5C55.1</b>	<b>Disorders of pyrimidine metabolism</b> <i>Coded Elsewhere:</i> Hereditary orotic aciduria (3A03.0) Haemolytic anaemia due to pyrimidine 5' nucleotidase deficiency (3A10.Y)

<b>5C56.0</b>	<b>Sphingolipidosis</b> <i>Coded Elsewhere:</i> Krabbe disease (8A44.4)
<b>5C56.00</b>	Gangliosidosis
<b>5C56.01</b>	Fabry disease Fabry disease (FD) is a progressive, inherited, multisystemic lysosomal storage disease characterised by specific neurological, cutaneous, renal, cardiovascular, cochleo-vestibular and cerebrovascular manifestations. <i>Coded Elsewhere:</i> Glomerular disease associated with Fabry disease (GB4Z)
<b>5C56.02</b>	Metachromatic leukodystrophy Metachromatic leukodystrophy is a neurodegenerative disease characterised by an accumulation of sulfatides (sulphated glycosphingolipids, especially sulfogalactosylceramides or sulfogalactocerebrosides) in the nervous system and kidneys. Three forms of the disease exist: late infantile, juvenile and adult.
<b>5C56.0Y</b>	Other specified sphingolipidosis

- 5C56.0Z** Sphingolipidosis, unspecified
- 5C56.1** **Neuronal ceroid lipofuscinosis**  
Neuronal ceroid lipofuscinoses (NCLs) are a group of inherited progressive degenerative brain diseases characterised clinically by a decline of mental and other capacities, epilepsy, and vision loss through retinal degeneration, and histopathologically by intracellular accumulation of an autofluorescent material, ceroid lipofuscin, in the neuronal cells in the brain and in the retina.
- 5C56.2** **Glycoproteinosis**  
These are lysosomal storage diseases affecting glycoproteins, resulting from defects in lysosomal function. The term is sometimes reserved for conditions involving degradation of glycoproteins.
- 5C56.20** Mucolipidosis  
**Exclusions:** Sialidosis (mucolipidosis type 1) (5C56.21)  
**Coded Elsewhere:** Mucolipidosis type 4 (5C56.0Y)  
Wolman disease (5C56.0Y)
- 5C56.21** Oligosaccharidosis
- 5C56.2Y** Other specified glycoproteinosis
- 5C56.2Z** Glycoproteinosis, unspecified
- 5C56.3** **Mucopolysaccharidosis**  
**Inclusions:** Disorders of glycosaminoglycan metabolism
- 5C56.30** Mucopolysaccharidosis type 1  
Mucopolysaccharidosis type 1 (MPS 1) is a rare lysosomal storage disease belonging to the group of mucopolysaccharidoses. There are three variants, differing widely in their severity, with Hurler syndrome (57% of cases) being the most severe, Scheie syndrome (20% of cases) the mildest and Hurler-Scheie syndrome (23% of cases) giving an intermediate phenotype.
- 5C56.31** Mucopolysaccharidosis type 2  
Mucopolysaccharidosis type 2 (MPS 2) is a lysosomal storage disease belonging to the group of mucopolysaccharidoses. The clinical picture ranges from severe (the most frequent form) with early psychomotor regression, facial dysmorphism (macroglossia, constantly opened mouth, coarse features), hepatosplenomegaly, limited joint motion, carpal tunnel syndrome, dysostosis multiplex, small size, behavioural disorders and psychomotor regression leading to intellectual deficit, deafness, cardiac and respiratory disorders, and cutaneous signs, to mild (normal intelligence, milder dysmorphism and dysostoses).  
**Inclusions:** Hunter syndrome

- 5C56.32** Mucopolysaccharidosis type 4  
Mucopolysaccharidosis type IV (MPS IV) is a lysosomal storage disease belonging to the group of mucopolysaccharidoses, and characterised by spondylo-epiphysometaphyseal dysplasia. It exists in two clinically indistinguishable forms, A and B. A deficiency in one of the two enzymes required for the degradation of keratan sulfate (KS) is responsible for the MPS IV subtypes: N-acetylgalactosamine-6-sulfate sulfatase in MPS IVA, and beta-D-galactosidase in MPS IVB.
- 5C56.33** Mucopolysaccharidosis type 6  
Mucopolysaccharidosis type 6 (MPS VI) is a lysosomal storage disease with progressive multisystem involvement, associated with a deficiency of arylsulfatase B (ASB) leading to the accumulation of dermatan sulfate. The disorder shows a wide spectrum of symptoms from slowly to rapidly progressing forms.
- 5C56.3Y** Other specified mucopolysaccharidosis
- 5C56.3Z** Mucopolysaccharidosis, unspecified
- 5C56.4** **Disorders of sialic acid metabolism**  
This refers to any disorders of the N- or O-substituted derivatives of neuraminic acid, a monosaccharide with a nine-carbon backbone.
- 5C56.Y** **Other specified lysosomal diseases**
- 5C56.Z** **Lysosomal diseases, unspecified**
- 5C57** **Peroxisomal diseases**  
Peroxisomal disorders represent a class of medical conditions caused by defects in peroxisome functions. This may be due to defects in single enzymes important for peroxisome function or in peroxins, proteins encoded by PEX genes that are critical for normal peroxisome assembly and biogenesis.
- Coded Elsewhere:** Primary hyperoxaluria type 1 (5C51.20)  
Adrenoleukodystrophy (8A44.1)  
Rhizomelic chondrodysplasia punctata (LD24.04)  
Glutaric aciduria type 3 (5C50.E0)
- 5C57.0** **Disorders of peroxisome biogenesis**  
Peroxisome biogenesis disorders (PBDs) include the Zellweger syndrome spectrum (PBD-ZSD) and rhizomelic chondrodysplasia punctata type 1 (RCDP1). PBD-ZSD represents a continuum of disorders including infantile Refsum disease, neonatal adrenoleukodystrophy, and Zellweger syndrome. Collectively, PBDs are autosomal recessive developmental brain disorders that also result in skeletal and craniofacial dysmorphism, liver dysfunction, progressive sensorineural hearing loss, and retinopathy.
- 5C57.1** **Disorders of peroxisomal alpha-, beta- or omega-oxidation**  
**Coded Elsewhere:** Congenital bile acid synthesis defect type 4 (5C52.11)

**5C58.0**

**Disorders of bilirubin metabolism or excretion**

**Coded Elsewhere:** Neonatal hyperbilirubinaemia (KA87)

**5C58.00**

**Crigler-Najjar syndrome**

Crigler-Najjar syndrome is an autosomal recessive disorder of bilirubin metabolism characterised by unconjugated hyperbilirubinemia due to a hepatic deficit of bilirubin glucuronosyltransferase activity. Two types have been described, CNS types 1 and 2, depending on whether the enzymatic deficit is complete or partial: clinical manifestations vary accordingly. Patients present with isolated jaundice that appears early in life. Biological analyses detect severe unconjugated hyperbilirubinemia with normal liver function tests. Abdominal imaging studies (plain X-rays, CT scans or ultrasonograms) and liver histology findings are normal. Diagnosis is generally confirmed by genomic DNA analysis.

**5C58.01**

**Gilbert syndrome**

Gilbert's syndrome is an inherited liver disorder characterised by jaundice due to unconjugated hyperbilirubinemia, resulting from a partial deficiency in hepatic bilirubin glucuronosyltransferase activity.

**5C58.02**

**Dubin-Johnson syndrome**

Dubin-Johnson syndrome (DJS) is a benign, inherited liver disorder characterised clinically by chronic, predominantly conjugated, hyperbilirubinemia and histopathologically by black-brown pigment deposition in parenchymal liver cells.

**5C58.03**

**Progressive familial intrahepatic cholestasis**

Progressive familial intrahepatic cholestasis (PFIC) refers to a heterogeneous group of autosomal recessive disorders of childhood that disrupt bile formation and present with cholestasis of hepatocellular origin. Three types of PFIC have been identified and are related to mutations in hepatocellular transport system genes involved in bile formation. PFIC1 and PFIC2 usually appear in the first months of life, whereas onset of PFIC3 may also occur later in infancy, in childhood or even during young adulthood.

**5C58.04**

**Benign recurrent intrahepatic cholestasis**

**5C58.0Y**

**Other specified disorders of bilirubin metabolism or excretion**

**5C58.0Z**

**Disorders of bilirubin metabolism or excretion, unspecified**

<b>5C58.1</b>	<b>Porphyrias</b> Porphyrias constitute a group of diseases characterised by intermittent neurovisceral manifestations, cutaneous lesions or by the combination of both. All porphyrias are caused by a deficiency in one of the enzymes of the heme biosynthesis pathway resulting in an accumulation of porphyrins and/or their precursors in the liver or bone marrow. Clinical signs of the disease usually appear in adulthood, but some porphyrias affect children. Porphyrias can be classified according to the main location of the metabolic anomaly. Direct or indirect neurotoxicity may cause neurological manifestations. Transmission of hereditary porphyrias is autosomal and either dominant with weak penetrance or recessive with complete penetrance. Diagnosis is mainly based on the measurement of porphyrins and their precursors in biological samples.
	<b>Coded Elsewhere:</b> Liver diseases due to porphyria (5C90.1)
<b>5C58.10</b>	Porphyria cutanea tarda Porphyria cutanea tarda (PCT) is due to an accumulation of uroporphyrins in plasma from blockage of the normal haem synthetic pathway in the liver at the level of uroporphyrinogen decarboxylase (URO-D). The majority of cases are sporadic and frequently associated with iron overload. PCT manifests as skin fragility and blistering in light-exposed skin, particularly on the dorsa of the hands, together with hypertrichosis.
<b>5C58.12</b>	Erythropoietic porphyrias Erythropoietic porphyrias are associated clinically with photosensitivity and biochemically with abnormal accumulation of porphyrins in erythrocytes. They include erythropoietic protoporphyrina and the very rare congenital erythropoietic porphyria.
<b>5C58.13</b>	Variegate porphyria Variegate porphyria is a form of acute hepatic porphyria characterised by the occurrence of neuro-visceral attacks with or without the presence of cutaneous lesions (bullous photodermatitis).

- 5C5A** **Alpha-1-antitrypsin deficiency**  
Alpha-1-antitrypsin deficiency (AATD) is a genetic disorder that manifests as pulmonary emphysema, liver cirrhosis and, rarely, as the skin disease panniculitis, and is characterised by low serum levels of AAT, the main protease inhibitor (PI) in human serum.
- 5C5Y** **Other specified inborn errors of metabolism**
- 5C5Z** **Inborn errors of metabolism, unspecified**
- Disorders of metabolite absorption or transport (5C60-5C6Z)
- 5C60** **Disorders of amino acid absorption or transport**  
Any condition caused by deficiencies in amino acid absorption and transport.  
**Exclusions:** Disorders of tryptophan metabolism (5C50.3)  
**Coded Elsewhere:** Fanconi syndrome (GB90.42)
- 5C60.0** **Oculocerebrorenal syndrome**  
Oculocerebrorenal syndrome of Lowe (OCRL) is a multisystem disorder characterised by congenital cataracts, glaucoma, intellectual disabilities, postnatal growth retardation and renal tubular dysfunction with chronic renal failure.
- 5C60.1** **Cystinosis**  
Cystinosis is a metabolic disease characterised by an accumulation of cystine inside the lysosomes of different tissues due to a defect in cystine transport out of lysosomes. There are three clinical forms : infantile, juvenile and ocular. The infantile form is severe, multisystem disease, with impaired proximal tubular reabsorptive capacity, with severe fluid-electrolyte balance alterations, cystine deposits in various organs and progression towards renal failure after 6 years of age. Juvenile cystinosis appear around 8 years of age and has an intermediate clinical picture with end-stage renal disease occurring after the age of 15. The ocular, adult form presents with photophobia.

<b>5C60.2</b>	<b>Cystinuria</b> Cystinuria is a renal tubular aminoacid transport disorder characterised by recurrent formation of kidneys cystine stones.
<b>5C60.Y</b>	<b>Other specified disorders of amino acid absorption or transport</b>
<b>5C60.Z</b>	<b>Disorders of amino acid absorption or transport, unspecified</b>
<b>5C61</b>	<b>Disorders of carbohydrate absorption or transport</b>
<b>5C61.0</b>	<b>Glucose-galactose malabsorption</b> Glucose-galactose malabsorption is characterised by diarrhoea and severe neonatal dehydration. Around 300 cases have been described to date. Moderate glucosuria has also been reported, but fructose absorption is normal. Glucose-galactose malabsorption is caused by a mutation in the SLC5A1 gene, encoding the glucose-sodium cotransporter, SGTL1. The mode of transmission is autosomal recessive. The fatal consequences of this syndrome can be avoided by following a glucose and galactose restricted diet.  <i><b>Exclusions:</b></i> Glucose or galactose intolerance of newborn (5C51.42)
<b>5C61.1</b>	<b>Maltase-glucoamylase deficiency</b> Chronic diarrhea due to glucoamylase deficiency is characterised by chronic diarrhoea in infancy or childhood in association with intestinal glucoamylase deficiency.
<b>5C61.2</b>	<b>Congenital sucrase-isomaltase deficiency</b> Congenital sucrase-isomaltase deficiency (CSID) is a carbohydrate intolerance disorder characterised by malabsorption of oligosaccharides and disaccharides. CSID is transmitted as an autosomal recessive trait and is caused by mutations in the brush-border membrane complex sucrase-isomaltase (SI), which is required for the breakdown of sucrose and starch into monosaccharides. The SI deficiency results in an accumulation of disaccharides in the lumen, causing osmotic diarrhoea. The prognosis for patients is good as the starch intolerance usually resolves during the first few years of life and sucrose intolerance usually improves with age.
<b>5C61.3</b>	<b>Alpha, alpha trehalase deficiency</b> Alpha, alpha trehalase deficiency is characterised by diarrhoea and vomiting after ingestion of trehalose, a disaccharide found mainly in mushrooms. The disease is very rare in most populations but the incidence has been estimated at least 1 in 13 in Greenland. Isolated trehalose intolerance is due to a deficiency of trehalase (TREH; 11q23.3), a brush-border membrane glycoprotein.
<b>5C61.4</b>	<b>Acquired monosaccharide malabsorption</b> This is an acquired condition in which the cells lining the intestine cannot take in one or all of the sugars glucose, galactose or fructose, which prevents proper digestion of these molecules and larger molecules made from them.  It may cause osmotic diarrhoea.
<b>5C61.40</b>	Fructose malabsorption

- 5C61.4Y** Other specified acquired monosaccharide malabsorption
- 5C61.4Z** Acquired monosaccharide malabsorption, unspecified
- 5C61.5** **Disorders of facilitated glucose transport**
- Coded Elsewhere:** Glycogen storage disease due to GLUT2 deficiency (5C51.3)
- 5C61.6** **Lactose intolerance**
- Lactose intolerance is the inability to digest lactose, a sugar found in milk and some dairy products, due to a deficiency of lactase, the enzyme that metabolizes lactose. Lactose intolerance occurs when lactose is not completely broken down and consequently the sugar cannot be absorbed into the blood.
- 5C61.60** Primary lactase deficiency
- 5C61.61** Congenital lactase deficiency
- This is a congenital deficiency of lactase (EC 3.2.1.108), inherited as an autosomal recessive trait, presenting in infancy and manifested by profuse watery diarrhoea in response to dietary milk, due to inability to digest lactose, a sugar found in milk and to a lesser extent milk-derived dairy products. The condition may lead to marasmus and death if lactose is not eliminated from the diet.
- 5C61.62** Secondary lactase deficiency
- This form of lactase deficiency results from some sort of damage to the intestines either due to a disease or surgery.
- Coding Note:** Code also the causing condition
- 5C61.6Z** Lactose intolerance, unspecified
- 5C61.Y** **Other specified disorders of carbohydrate absorption or transport**
- 5C61.Z** **Disorders of carbohydrate absorption or transport, unspecified**
- 5C62** **Disorders of lipid absorption or transport**
- 5C63** **Disorders of vitamin or non-protein cofactor absorption or transport**
- Coded Elsewhere:** Hereditary factor X deficiency (3B14.1)
- Combined deficiency of vitamin K-dependent clotting factors (3B14.2)
- 5C63.0** **Disorders of cobalamin metabolism or transport**
- Coded Elsewhere:** Hereditary vitamin B12 deficiency anaemia (3A01.0)
- Neonatal vitamin B12 deficiency anaemia (3A01.1)
- Methylmalonic aciduria, vitamin B12 responsive (5C50.E0)
- Congenital or neonatal vitamin B12 deficiency anaemia (3A01.Z)
- 5C63.1** **Disorders of folate metabolism or transport**
- Coded Elsewhere:** Formiminoglutamic aciduria (3A02.Y)
- 5C63.2** **Disorders of vitamin D metabolism or transport**

- 5C63.20** Hypocalcaemic vitamin D dependent rickets  
Hypocalcaemic vitamin D-dependent rickets (VDDR-I) is an early-onset hereditary vitamin D metabolism disorder characterised by severe hypocalcaemia leading to osteomalacia and rachitic bone deformations, and moderate hypophosphatemia.
- 5C63.21** Hypocalcaemic vitamin D resistant rickets  
Hypocalcaemic vitamin D-resistant rickets is a hereditary disorder of vitamin D action characterised by hypocalcaemia, severe rickets and in many cases alopecia.
- 5C63.22** Hypophosphataemic rickets  
Hypophosphatemic rickets is a group of genetic diseases characterised by hypophosphatemia, rickets, and normal serum levels of calcium.
- 5C63.2Y** Other specified disorders of vitamin D metabolism or transport
- 5C63.2Z** Disorders of vitamin D metabolism or transport, unspecified
- 5C63.Y** **Other specified disorders of vitamin or non-protein cofactor absorption or transport**
- 5C63.Z** **Disorders of vitamin or non-protein cofactor absorption or transport, unspecified**

## 5C64

### **Disorders of mineral absorption or transport**

A condition in which there is a deviation or interruption in the processing of a specific mineral in the body: its absorption, transport, storage, and utilization

- Exclusions:** Disorders of the parathyroids or parathyroid hormone system (5A50-5A5Z)
- Vitamin D deficiency (5B57)  
dietary mineral deficiency (5B5K)

- 5C64.0** **Disorders of copper metabolism**  
Any condition caused by failure to correctly metabolize copper.  
**Coded Elsewhere:** X-linked cutis laxa (LD28.2)
- 5C64.00** Wilson disease  
Wilson disease is an autosomal recessive disorder of copper metabolism characterised by the toxic accumulation of copper, mainly in the liver and central nervous system that may present as hepatic, neurologic or psychiatric forms.
- 5C64.0Y** Other specified disorders of copper metabolism
- 5C64.0Z** Disorders of copper metabolism, unspecified
- 5C64.1** **Disorders of iron metabolism**  
This refers to any disorders of the set of chemical reactions maintaining human homeostasis of iron. The control of this necessary but potentially toxic substance is an important part of many aspects of human health and disease.
- Exclusions:** Sideroblastic anaemia (3A72)  
Iron deficiency anaemia (3A00)

- 5C64.10** Iron overload diseases  
 Iron overload is the accumulation of excess iron in body tissues. Iron overload usually occurs as a result of a genetic predisposition to absorb and store iron in excess amounts, the most common form of which is hereditary hemochromatosis. Iron overload can also occur as a complication of other hematologic disorders that require chronic transfusion therapy, repeated injections of parenteral iron, or excessive iron ingestion. Excessive iron stores usually accumulate in the reticuloendothelial tissues and cause little damage (" hemosiderosis"). If overload continues, iron eventually begins to accumulate in tissues such as hepatic parenchyma, pancreas, heart and synovium, causing hemochromatosis.
- Coded Elsewhere:** Friedreich ataxia (8A03.10)  
 Atransferrinaemia (3A00.Y)  
 Microcytic anaemia with liver iron overload (3A00.Y)
- 5C64.1Y** Other specified disorders of iron metabolism
- 5C64.1Z** Disorders of iron metabolism, unspecified
- 5C64.2** **Disorders of zinc metabolism**  
 Any condition caused by failure to correctly metabolize zinc. These conditions may present with dermatitis, diarrhoea, alopecia, loss of appetite, growth impairment, neuropsychological changes, or immune deficiency syndromes.
- 5C64.20** Acrodermatitis enteropathica  
 Acrodermatitis enteropathica is an uncommon autosomal recessive disorder of intestinal zinc absorption. Signs usually appear within the first months of life with an exudative and crusted erythema located predominantly around body orifices (mouth, anogenital) and on the scalp and distal extremities. The signs are often misdiagnosed as being due to infection. The condition responds rapidly to zinc supplementation which must be continued throughout life.
- 5C64.21** Zinc deficiency syndromes  
**Coded Elsewhere:** Acrodermatitis enteropathica (5C64.20)
- 5C64.2Y** Other specified disorders of zinc metabolism
- 5C64.2Z** Disorders of zinc metabolism, unspecified
- 5C64.3** **Disorders of phosphorus metabolism or phosphatases**  
 Any condition caused by errors in phosphorus metabolism, or in phosphatase activity.
- Exclusions:** Adult osteomalacia (FB83.2)  
 Osteoporosis (FB83.1)
- Coded Elsewhere:** Hypophosphataemic rickets (5C63.22)  
 Phosphate losing hypophosphataemia (GB90.48)

<b>5C64.4</b>	<b>Disorders of magnesium metabolism</b> Any condition caused by failure to correctly metabolize magnesium.  <b>Coded Elsewhere:</b> Transitory neonatal disorders of calcium or magnesium metabolism (KB61)
<b>5C64.40</b>	Hypermagnesaemia This is an electrolyte disturbance in which there is an abnormally elevated level of magnesium in the blood. Usually this results in excess of magnesium in the body.
<b>5C64.41</b>	Hypomagnesaemia This is an electrolyte disturbance in which there is an abnormally low level of magnesium in the blood. Normal magnesium levels in humans fall between 1.5 - 2.5 mg/dL. Usually a serum level less than 0.7 mmol/L is used as reference for hypomagnesemia (not hypomagnesia which refers to low magnesium content in food/supplement sources).  <b>Coded Elsewhere:</b> Neonatal hypomagnesaemia (KB61.0)
<b>5C64.4Z</b>	Disorders of magnesium metabolism, unspecified
<b>5C64.5</b>	<b>Disorders of calcium metabolism</b> This refers to disorders in the mechanism by which the body maintains adequate calcium levels. Derangements of this mechanism lead to hypercalcaemia or hypocalcaemia, both of which can have important consequences for health.  <b>Exclusions:</b> Hyperparathyroidism (5A51) Chondrocalcinosis (FA26.2)  <b>Coded Elsewhere:</b> Familial hypocalciuric hypercalcaemia (5A51.2) Hypercalciuria (MF98.0) Nephrocalcinosis (GB57) Hypercalcaemia (5B91.0) Transitory neonatal disorders of calcium or magnesium metabolism (KB61)
<b>5C64.6</b>	<b>Disorders of sodium metabolism</b> <b>Coded Elsewhere:</b> Tubular disorders of sodium or potassium transport (GB90.46) Congenital sodium diarrhoea (DA90.1)
<b>5C64.7</b>	<b>Disorders of chloride metabolism</b> <b>Coded Elsewhere:</b> Congenital chloride diarrhoea (DA90.1)
<b>5C64.Y</b>	<b>Disorders of other specified mineral absorption and transport</b>
<b>5C64.Z</b>	<b>Disorders of mineral absorption or transport, unspecified</b>
<b>5C6Y</b>	<b>Other specified disorders of metabolite absorption or transport</b>
<b>5C6Z</b>	<b>Disorders of metabolite absorption or transport, unspecified</b>

Disorders of fluid, electrolyte or acid-base balance (5C70-5C7Z)

**5C70**

### **Volume depletion**

**Exclusions:** Hypovolaemic shock (MG40.1)

**5C70.0**

### **Dehydration**

Dehydration occurs when there is an insufficient amount or excessive loss of water in the body. This can be caused by vomiting, diarrhoea, fever, use of diuretics, profuse sweating, or decreased water intake.

**Coded Elsewhere:** Dehydration of newborn (KB63.1)

**5C70.1**

### **Hypovolaemia**

This is a state of decreased blood volume; more specifically, decrease in volume of blood plasma. It is thus the intravascular component of volume contraction (or loss of blood volume due to things such as haemorrhaging or dehydration), but, as it also is the most essential one, hypovolemia and volume contraction are sometimes used synonymously.

**Exclusions:** Traumatic shock, not elsewhere classified (NF0A.4)

Hypovolaemic shock (MG40.1)

**5C70.Y**

### **Other specified volume depletion**

**5C70.Z**

### **Volume depletion, unspecified**

**5C71**

### **Hyperosmolality or hypernatraemia**

Serum sodium concentrations in excess of 145 mmol/L; increased serum concentration of osmotically active particles

**Coded Elsewhere:** Hypernatremia of newborn (KB63.21)

**5C72**

### **Hypo-osmolality or hyponatraemia**

Serum sodium concentrations of less than 135 mEq/L; decreased serum concentration of osmotically active particles

**Inclusions:** sodium [na] deficiency

**Exclusions:** Syndrome of inappropriate secretion of antidiuretic hormone (5A60.2)

**Coded Elsewhere:** Hyponatremia of newborn (KB63.20)

**5C73**

### **Acidosis**

Acidosis is an abnormally acidic state of the blood and tissues.

**Exclusions:** diabetic acidosis (5A10-5A2Y)

**Coded Elsewhere:** Late metabolic acidosis of newborn (KB63.0)

Kussmaul respiration (5A22.Y)

- 5C73.0 Acute respiratory acidosis**  
This is an acute condition in which decreased ventilation (hypoventilation) causes increased blood carbon dioxide concentration and decreased pH (a condition generally called acidosis). Carbon dioxide is produced continuously as the body's cells respire, and this CO<sub>2</sub> will accumulate rapidly if the lungs do not adequately expel it through alveolar ventilation. Alveolar hypoventilation thus leads to an increased PaCO<sub>2</sub> (called hypercapnia). The increase in PaCO<sub>2</sub> in turn decreases the HCO<sub>3</sub><sup>-</sup>/PaCO<sub>2</sub> ratio and decreases pH.
- 5C73.1 Chronic respiratory acidosis**  
This is a chronic condition in which decreased ventilation (hypoventilation) causes increased blood carbon dioxide concentration and decreased pH (a condition generally called acidosis). Carbon dioxide is produced continuously as the body's cells respire, and this CO<sub>2</sub> will accumulate rapidly if the lungs do not adequately expel it through alveolar ventilation. Alveolar hypoventilation thus leads to an increased PaCO<sub>2</sub> (called hypercapnia). The increase in PaCO<sub>2</sub> in turn decreases the HCO<sub>3</sub><sup>-</sup>/PaCO<sub>2</sub> ratio and decreases pH.
- 5C73.2 Anion gap metabolic acidosis**  
This is a form of metabolic acidosis characterised by a high anion gap. The list of agents that cause high anion gap metabolic acidosis is similar to but broader than the list of agents that cause a serum osmolal gap.
- 5C73.Y Other specified acidosis**
- 5C73.Z Acidosis, unspecified**
- 5C74 Alkalosis**  
Alkalosis is an abnormally basic state of the blood and tissues.
- 5C75 Mixed disorder of acid-base balance**  
This is a condition where more than one of the normal mechanisms that regulate the amount of acid or base content in the body are dysfunctional.
- 5C76 Hyperkalaemia**  
*Inclusions:* Potassium [K] excess  
Potassium [K] overload  
*Coded Elsewhere:* Hyperkalaemia of newborn (KB63.31)
- 5C77 Hypokalaemia**  
*Coded Elsewhere:* Hypokalaemia of newborn (KB63.30)

**5C78**

### **Fluid overload**

This is the condition where there is too much fluid in the blood. The opposite condition is hypovolemia, which is too little fluid volume in the blood. Fluid volume excess in the intravascular compartment occurs due to an increase in total body sodium content and a consequent increase in extracellular body water. The mechanism usually stems from compromised regulatory mechanisms for sodium handling as seen in congestive heart failure (CHF), kidney failure, and liver failure. It may also be caused by excessive intake of sodium from foods, intravenous (IV) solutions and blood transfusions, medications, or diagnostic contrast dyes.

**5C7Y**

### **Other specified disorders of fluid, electrolyte or acid-base balance**

**5C7Z**

### **Disorders of fluid, electrolyte or acid-base balance, unspecified**

Disorders of lipoprotein metabolism or certain specified lipidaemias (5C80-5C8Z)

Elevated levels of lipoprotein(a), or Lp(a), in the blood. It is associated with an elevated risk of cardiovascular diseases.

**Exclusions:** Sphingolipidosis (5C56.0)

**Coded Elsewhere:** Lipoid dermatopathology (FA38.Y)

Multicentric reticulohistiocytosis (EE8Y)

Lipoid proteinosis (LD27.Y)

**5C80**

### **Hyperlipoproteinaemia**

Disorders of lipoprotein metabolism that result in high levels of lipoproteins in the circulating blood

**5C80.0**

### **Hypercholesterolaemia**

**5C80.00**

Primary hypercholesterolaemia

This is a genetic disorder characterised by high cholesterol levels, specifically very high levels of low-density lipoprotein (LDL, "bad cholesterol"), in the blood and early cardiovascular disease.

**Coded Elsewhere:** Sitosterolaemia (5C52.1Y)

**5C80.01**

Secondary hypercholesterolaemia

**Coding Note:**

Code also the causing condition

**5C80.0Z**

Hypercholesterolaemia, unspecified

**5C80.1**

### **Hypertriglyceridaemia**

A form of hyperlipidaemia characterised by abnormally elevated levels of triglyceride-rich lipoproteins in the blood. It is associated with an elevated risk of cardiovascular morbidity.

**Inclusions:** Hyperlipidaemia, group B

Endogenous hypertriglyceridaemia

<b>5C80.2</b>	<b>Mixed hyperlipidaemia</b> Elevated levels of both LDL cholesterol and triglycerides in the blood
	<b>Inclusions:</b> Hyperbetalipoproteinaemia with prebetalipoproteinaemia Hypercholesterolaemia with endogenous hyperglyceridaemia Hyperlipidaemia, group C
	<b>Exclusions:</b> cerebrotendinous cholesterosis [van Bogaert-Scherer-Epstein] (5C52.11)
<b>5C80.3</b>	<b>Hyperalphalipoproteinaemia</b> A condition in which high-density lipoprotein is elevated in the blood.
<b>5C80.Y</b>	<b>Other specified hyperlipoproteinaemia</b>
<b>5C80.Z</b>	<b>Hyperlipoproteinaemia, unspecified</b>
<b>5C81</b>	<b>Hypolipoproteinaemia</b> Disorders characterised by low level of lipoproteins of any type in the blood
	<b>Inclusions:</b> High-density lipoprotein deficiency
<b>5C81.0</b>	<b>Hypoalphalipoproteinaemia</b> A disorder characterised by low levels of high-density lipoprotein in the blood.
<b>5C81.1</b>	<b>Hypobetalipoproteinaemia</b> Hypobetalipoproteinemia (HBL) constitutes a group of lipoprotein metabolism disorders that are characterised by permanently low levels (below the 5th percentile) of apolipoprotein B and LDL cholesterol. There are two types of HBL: familial hypobetalipoproteinemia and chylomicron retention disease (CMRD; see these terms). The familial form can be severe with early onset (abetalipoproteinemia/homozygous familial hypobetalipoproteinemia; see this term) or benign (benign familial hypobetalipoproteinemia; see this term). (Please add the sentence). Severe familial HBL and CMRD appear in infancy or childhood. As a result they are often associated with growth delay, diarrhoea with steatorrhoea, and fat malabsorption. Benign familial hypobetalipoproteinemia is generally asymptomatic, but in adults is occasionally associated with dietary intolerance to fat. HBL disorders are caused by mutations in proteins involved in the synthesis, secretion and catabolism of lipoproteins containing apolipoprotein B (LDL, VLDL and chylomicrons).
<b>5C81.Y</b>	<b>Other specified hypolipoproteinaemia</b>
<b>5C81.Z</b>	<b>Hypolipoproteinaemia, unspecified</b>
<b>5C8Y</b>	<b>Other specified disorders of lipoprotein metabolism or lipidaemias</b>
<b>5C8Z</b>	<b>Unspecified disorders of lipoprotein metabolism or lipidaemias</b>

**5C90**

**Metabolic or transporter liver disease**

- Exclusions:**
- Alcoholic liver disease (DB94)
  - Non-alcoholic fatty liver disease (DB92)
  - Drug-induced or toxic liver disease (DB95)
  - Acute fatty liver of pregnancy (JA65.0)
- Coded Elsewhere:**
- Bile acid synthesis defect with cholestasis (5C52.11)
  - Progressive familial intrahepatic cholestasis (5C58.03)
  - Benign recurrent intrahepatic cholestasis (5C58.04)
  - Glycogen storage disease (5C51.3)
  - Disorders of galactose metabolism (5C51.4)
  - Disorders of fructose metabolism (5C51.5)
  - Alpha-1-antitrypsin deficiency (5C5A)
  - Reye syndrome (8E46)

**5C90.0**

**Liver diseases due to urea cycle defects**

This is a group of liver diseases due to defects in the urea cycle, which is a metabolic cycle of nitrogen-containing compounds that produces the waste product urea.

- Coded Elsewhere:**
- Argininosuccinic aciduria (5C50.A0)
  - Carbamoylphosphate synthetase deficiency (5C50.A1)
  - Argininaemia (5C50.A2)
  - Ornithine carbamoyltransferase deficiency (5C50.AY)

**5C90.1**

**Liver diseases due to disorders of porphyrin or bilirubin metabolism or transport**

These are liver diseases due to disorders of porphyrin and bilirubin metabolism and transport

- Exclusions:**
- Defects of catalase and peroxidase (5C58)
- Coded Elsewhere:**
- Porphyria cutanea tarda (5C58.10)
  - Variegate porphyria (5C58.13)
  - Crigler-Najjar syndrome (5C58.00)
  - Gilbert syndrome (5C58.01)
  - Dubin-Johnson syndrome (5C58.02)
  - Rotor syndrome (5C58.0Y)

**5C90.2**

**Liver diseases due to disorders of amino acid metabolism**

This is liver disease due to the disorder of the various biochemical processes responsible for the synthesis of proteins and amino acids, and the breakdown of proteins (and other large molecules, too) by catabolism.

- Coded Elsewhere:**
- Disorders of tyrosine metabolism (5C50.1)
  - Citrullinaemia (5C50.A3)

<b>5C90.3</b>	<b>Liver disease due to disorders of lysosomal storage</b> This is liver disease due to a group of approximately 50 rare inherited metabolic disorders that result from defects in lysosomal function.  <b>Coded Elsewhere:</b> Gaucher disease (5C56.0Y) Niemann-Pick disease (5C56.0Y) Wolman disease (5C56.0Y) Cholesteryl ester storage disease (5C56.0Y)
<b>5C90.4</b>	<b>Liver diseases due to mitochondrial disorders</b> This is liver disease due to a group of disorders caused by dysfunctional mitochondria, the organelles that generate energy for the cell.
<b>5C90.5</b>	<b>Liver diseases due to disorders of mineral metabolism</b> This is a liver disease due to a disorder of the organic compound required by an organism as a vital nutrient in limited amounts.
<b>Coding Note:</b>	Code also the causing condition
<b>5C90.Y</b>	<b>Other specified metabolic or transporter liver disease</b>
<b>5C90.Z</b>	<b>Metabolic or transporter liver disease, unspecified</b>
Other metabolic disorders (5D00-5D0Y)	
<b>Exclusions:</b>	histiocytosis X (chronic) (2B31.2)
<b>Coded Elsewhere:</b>	Tophaceous gout (FA25.20)
<b>5D00</b>	<b>Amyloidosis</b> Amyloidosis is a vast group of diseases defined by the presence of insoluble protein deposits in tissues. Its diagnosis is based on histological findings. Amyloidoses are classified according to clinical signs and biochemical type of amyloid protein involved. Most amyloidoses are multisystemic, 'generalised' or 'diffuse'. There are a few forms of localised amylosis. The most frequent forms are AL amyloidosis (immunoglobulins), AA (inflammatory), and ATTR (transthyretin accumulation).  <b>Exclusions:</b> Dementia due to Alzheimer disease (6D80)
<b>5D00.0</b>	<b>AL amyloidosis</b> AL amyloid is due to the deposition of immunoglobulin light chains in glomeruli where they are seen as Congo red binding fibrils and immuno-stain specifically for kappa or lambda light chains. By light microscopy there is amorphous hyaline material in the mesangium and capillary walls. A light chain producing plasma cell or B-cell dysplasia is responsible. Other organs are also involved in this systemic disease.  <b>Coded Elsewhere:</b> Isolated cerebral amyloid angiopathy (8B22.3)

<b>5D00.1</b>	<b>AA amyloidosis</b> AA amyloid is due to the deposition of the acute phase reactant serum amyloid A protein (SAA) in glomeruli where they are seen as Congo red binding fibrils which immunostain specifically for SAA. Chronic inflammation is responsible. Other organs are also involved in this systemic disease.
<b>5D00.2</b>	<b>Hereditary amyloidosis</b> Hereditary amyloidosis (familial amyloidosis) is an inherited disorder that often affects the liver, nerves, heart and kidneys. Many different types of gene abnormalities present at birth are associated with an increased risk of amyloid disease. The type and location of an amyloid gene abnormality can affect the risk of certain complications, the age at which symptoms first appear, and the way the disease progresses over time.
<b>5D00.20</b>	Hereditary ATTR amyloidosis
<b>5D00.21</b>	<b>Non-neuropathic heredofamilial amyloidosis</b> This is an amyloidosis (the formation of insoluble proteins, or amyloids) of inherited origin that does not affect the peripheral nerves. The most common sites of deposits are associated with the kidney and heart. <b>Coded Elsewhere:</b> Familial Mediterranean fever with amyloidosis (4A60.0)
<b>5D00.2Y</b>	Other specified hereditary amyloidosis
<b>5D00.2Z</b>	Hereditary amyloidosis, unspecified
<b>5D00.3</b>	<b>Dialysis-associated amyloidosis</b> Dialysis-related amyloidosis develops when proteins in blood are deposited in joints and tendons — causing pain, stiffness and fluid in the joints, as well as carpal tunnel syndrome. This type generally affects people on long-term dialysis.
<b>5D00.Y</b>	<b>Other specified amyloidosis</b>
<b>5D00.Z</b>	<b>Amyloidosis, unspecified</b>
<b>5D01</b>	<b>Tumour lysis syndrome</b> This is a group of metabolic complications that can occur after treatment of cancer, usually lymphomas and leukaemias, and sometimes even without treatment. These complications are caused by the breakdown products of dying cancer cells and include hyperkalaemia, hyperphosphataemia, hyperuricaemia and hyperuricosuria, hypocalcaemia, and consequent acute uric acid nephropathy and acute renal failure.
<b>Coding Note:</b>	Code also the causing condition
<b>5D0Y</b>	<b>Other specified metabolic disorders</b>
<b>5D2Z</b>	<b>Metabolic disorders, unspecified</b>

## Postprocedural endocrine or metabolic disorders (5D40-5D46)

Any endocrine or metabolic disorder caused by or subsequent to any medical procedure.

**Coded Elsewhere:** Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

### 5D40 Postprocedural hypothyroidism

#### 5D40.0 Postirradiation hypothyroidism

5D40.00 Hypothyroidism postradioactive iodine ablation

5D40.0Y Other specified postirradiation hypothyroidism

5D40.0Z Postirradiation hypothyroidism, unspecified

#### 5D40.Y Other specified postprocedural hypothyroidism

#### 5D40.Z Postprocedural hypothyroidism, unspecified

### 5D41 Postprocedural hypoinsulinaemia

This is a low level of insulin that can result after medical procedures, including radiation, and it carries a risk of developing diabetes mellitus.

**Inclusions:** Postpancreatectomy hyperglycaemia  
Postsurgical hypoinsulinaemia

### 5D42 Postprocedural hypoparathyroidism

This refers to a postprocedural decreased function of the parathyroid glands with underproduction of parathyroid hormone. This can lead to low levels of calcium in the blood, often causing cramping and twitching of muscles or tetany (involuntary muscle contraction), and several other symptoms.

**Inclusions:** Parathyroprival tetany

### 5D43 Postprocedural hypopituitarism

This is the postprocedural decreased (hypo) secretion of one or more of the eight hormones normally produced by the pituitary gland at the base of the brain. If there is decreased secretion of most pituitary hormones, the term panhypopituitarism (pan meaning "all") is used.

### 5D44 Postprocedural ovarian failure

A condition in women characterised by amenorrhea, caused by or subsequent to any intervention. This condition may also present with hot flashes, night sweats, irritability, poor concentration, decreased sex drive, pain during sex, vaginal dryness.

### 5D45 Postprocedural testicular hypofunction

A condition in men characterised by testosterone deficiency, caused by or subsequent to any intervention. This condition may present with fatigue, decreased libido, erectile dysfunction, negative mood states, decreased lean body mass, increased fat mass, or decreased bone mineral density.

**5D46**

**Postprocedural adrenocortical hypofunction**

A condition caused by or subsequent to any medical procedure. This condition is characterised by adrenocortical hormone deficiency. This condition may present with chronic fatigue, muscle weakness, loss of appetite, weight loss or abdominal pain.

# CHAPTER 06

---

## Mental, behavioural or neurodevelopmental disorders

This chapter has 162 four-character categories.

Code range starts with 6A00

Mental, behavioural and neurodevelopmental disorders are syndromes characterised by clinically significant disturbance in an individual's cognition, emotional regulation, or behaviour that reflects a dysfunction in the psychological, biological, or developmental processes that underlie mental and behavioural functioning. These disturbances are usually associated with distress or impairment in personal, family, social, educational, occupational, or other important areas of functioning.

- Exclusions:**      Acute stress reaction (QE84)  
                        Uncomplicated bereavement (QE62)
- Coded Elsewhere:** Sleep-wake disorders (7A00-7B2Z)  
                        Sexual dysfunctions (HA00-HA0Z)  
                        Gender incongruence (HA60-HA6Z)

This chapter contains the following top level blocks:

- Neurodevelopmental disorders
- Schizophrenia or other primary psychotic disorders
- Catatonia
- Mood disorders
- Anxiety or fear-related disorders
- Obsessive-compulsive or related disorders
- Disorders specifically associated with stress
- Dissociative disorders
- Feeding or eating disorders
- Elimination disorders
- Disorders of bodily distress or bodily experience
- Disorders due to substance use or addictive behaviours
- Impulse control disorders
- Disruptive behaviour or dissociative disorders
- Personality disorders and related traits
- Paraphilic disorders
- Factitious disorders
- Neurocognitive disorders

- Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium
- Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere

## Neurodevelopmental disorders (6A00-6A0Z)

Neurodevelopmental disorders are behavioural and cognitive disorders that arise during the developmental period that involve significant difficulties in the acquisition and execution of specific intellectual, motor, language, or social functions. Although behavioural and cognitive deficits are present in many mental and behavioural disorders that can arise during the developmental period (e.g., Schizophrenia, Bipolar disorder), only disorders whose core features are neurodevelopmental are included in this grouping. The presumptive etiology for neurodevelopmental disorders is complex, and in many individual cases is unknown.

**Coded Elsewhere:** Primary tics or tic disorders (8A05.0)

Secondary neurodevelopmental syndrome (6E60)

**6A00**

### Disorders of intellectual development

Disorders of intellectual development are a group of etiologically diverse conditions originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately two or more standard deviations below the mean (approximately less than the 2.3rd percentile), based on appropriately normed, individually administered standardized tests. Where appropriately normed and standardized tests are not available, diagnosis of disorders of intellectual development requires greater reliance on clinical judgment based on appropriate assessment of comparable behavioural indicators.

**Coding Note:** Use additional code, if desired, to identify any known aetiology.

**Exclusions:** Dementia (6D80-6D8Z)

**6A00.0**

### Disorder of intellectual development, mild

A mild disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately two to three standard deviations below the mean (approximately 0.1 – 2.3 percentile), based on appropriately normed, individually administered standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Affected persons often exhibit difficulties in the acquisition and comprehension of complex language concepts and academic skills. Most master basic self-care, domestic, and practical activities. Persons affected by a mild disorder of intellectual development can generally achieve relatively independent living and employment as adults but may require appropriate support.

**6A00.1**

**Disorder of intellectual development, moderate**

A moderate disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately three to four standard deviations below the mean (approximately 0.003 – 0.1 percentile), based on appropriately normed, individually administered standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Language and capacity for acquisition of academic skills of persons affected by a moderate disorder of intellectual development vary but are generally limited to basic skills. Some may master basic self-care, domestic, and practical activities. Most affected persons require considerable and consistent support in order to achieve independent living and employment as adults.

**6A00.2**

**Disorder of intellectual development, severe**

A severe disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately four or more standard deviations below the mean (less than approximately the 0.003rd percentile), based on appropriately normed, individually administered standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Affected persons exhibit very limited language and capacity for acquisition of academic skills. They may also have motor impairments and typically require daily support in a supervised environment for adequate care, but may acquire basic self-care skills with intensive training. Severe and profound disorders of intellectual development are differentiated exclusively on the basis of adaptive behaviour differences because existing standardized tests of intelligence cannot reliably or validly distinguish among individuals with intellectual functioning below the 0.003rd percentile.

**6A00.3**

**Disorder of intellectual development, profound**

A profound disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately four or more standard deviations below the mean (approximately less than the 0.003rd percentile), based on individually administered appropriately normed, standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Affected persons possess very limited communication abilities and capacity for acquisition of academic skills is restricted to basic concrete skills. They may also have co-occurring motor and sensory impairments and typically require daily support in a supervised environment for adequate care. Severe and profound disorders of intellectual development are differentiated exclusively on the basis of adaptive behaviour differences because existing standardized tests of intelligence cannot reliably or validly distinguish among individuals with intellectual functioning below the 0.003rd percentile.

**6A00.4      Disorder of intellectual development, provisional**

Disorder of intellectual development, provisional is assigned when there is evidence of a disorder of intellectual development but the individual is an infant or child under the age of four or it is not possible to conduct a valid assessment of intellectual functioning and adaptive behaviour because of sensory or physical impairments (e.g., blindness, pre-lingual deafness), motor or communication impairments, severe problem behaviours or co-occurring mental and behavioural disorders.

**6A00.Z      Disorders of intellectual development, unspecified**

**Coding Note:** Use additional code, if desired, to identify any known aetiology.

**6A01**

**Developmental speech or language disorders**

Developmental speech or language disorders arise during the developmental period and are characterised by difficulties in understanding or producing speech and language or in using language in context for the purposes of communication that are outside the limits of normal variation expected for age and level of intellectual functioning. The observed speech and language problems are not attributable to regional, social, or cultural/ethnic language variations and are not fully explained by anatomical or neurological abnormalities. The presumptive aetiology for Developmental speech or language disorders is complex, and in many individual cases, is unknown.

**6A01.0      Developmental speech sound disorder**

Developmental speech sound disorder is characterised by difficulties in the acquisition, production and perception of speech that result in errors of pronunciation, either in number or types of speech errors made or the overall quality of speech production, that are outside the limits of normal variation expected for age and level of intellectual functioning and result in reduced intelligibility and significantly affect communication. The errors in pronunciation arise during the early developmental period and cannot be explained by social, cultural, and other environmental variations (e.g., regional dialects). The speech errors are not fully explained by a hearing impairment or a structural or neurological abnormality.

**Inclusions:** Functional speech articulation disorder

**Exclusions:** Deafness not otherwise specified (AB52)

Diseases of the nervous system (Chapter 08)

Dysarthria (MA80.2)

Verbal apraxia (MB4A)

6A01.1	<b>Developmental speech fluency disorder</b>
	<p>Developmental speech fluency disorder is characterised by frequent or pervasive disruption of the normal rhythmic flow and rate of speech characterised by repetitions and prolongations in sounds, syllables, words, and phrases, as well as blocking and word avoidance or substitutions. The speech dysfluency is persistent over time. The onset of speech dysfluency occurs during the developmental period and speech fluency is markedly below what would be expected for age. Speech dysfluency results in significant impairment in social communication, personal, family, social, educational, occupational or other important areas of functioning. The speech dysfluency is not better accounted for by a Disorder of Intellectual Development, a Disease of the Nervous System, a sensory impairment, or a structural abnormality, or other speech or voice disorder.</p>
	<p><b>Exclusions:</b> Tic disorders (8A05)</p>
6A01.2	<b>Developmental language disorder</b>
	<p>Developmental language disorder is characterised by persistent deficits in the acquisition, understanding, production or use of language (spoken or signed), that arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. The individual's ability to understand, produce or use language is markedly below what would be expected given the individual's age. The language deficits are not explained by another neurodevelopmental disorder or a sensory impairment or neurological condition, including the effects of brain injury or infection.</p>
	<p><b>Exclusions:</b> Autism spectrum disorder (6A02)</p>
	<p>Diseases of the nervous system (Chapter 08)</p>
	<p>Deafness not otherwise specified (AB52)</p>
	<p>Selective mutism (6B06)</p>
6A01.20	<p>Developmental language disorder with impairment of receptive and expressive language</p>
	<p>Developmental language disorder with impairment of receptive and expressive language is characterised by persistent difficulties in the acquisition, understanding, production, and use of language that arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. The ability to understand spoken or signed language (i.e., receptive language) is markedly below the expected level given the individual's age and level of intellectual functioning, and is accompanied by persistent impairment in the ability to produce and use spoken or signed language (i.e., expressive language).</p>
	<p><b>Inclusions:</b> developmental dysphasia or aphasia, receptive type</p>
	<p><b>Exclusions:</b> acquired aphasia with epilepsy [Landau-Kleffner] (8A62.2)</p>
	<p>Autism spectrum disorder (6A02)</p>
	<p>Selective mutism (6B06)</p>
	<p>dysphasia NOS (MA80.1)</p>
	<p>Diseases of the nervous system (Chapter 08)</p>
	<p>Deafness not otherwise specified (AB52)</p>

<b>6A01.21</b>	<p>Developmental language disorder with impairment of mainly expressive language</p> <p>Developmental language disorder with impairment of mainly expressive language is characterised by persistent difficulties in the acquisition, production, and use of language that arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. The ability to produce and use spoken or signed language (i.e., expressive language) is markedly below the expected level given the individual's age and level of intellectual functioning, but the ability to understand spoken or signed language (i.e., receptive language) is relatively intact.</p> <p><b>Inclusions:</b> Developmental dysphasia or aphasia, expressive type</p> <p><b>Exclusions:</b></p> <ul style="list-style-type: none"> <li>acquired aphasia with epilepsy [Landau-Kleffner] (8A62.2)</li> <li>Selective mutism (6B06)</li> <li>dysphasia and aphasia: developmental, receptive type (6A01.20)</li> <li>dysphasia NOS (MA80.1)</li> <li>aphasia NOS (MA80.0)</li> <li>Diseases of the nervous system (Chapter 08)</li> <li>Deafness not otherwise specified (AB52)</li> </ul>
<b>6A01.22</b>	<p>Developmental language disorder with impairment of mainly pragmatic language</p> <p>Developmental language disorder with impairment of mainly pragmatic language is characterised by persistent and marked difficulties with the understanding and use of language in social contexts, for example making inferences, understanding verbal humour, and resolving ambiguous meaning. These difficulties arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. Pragmatic language abilities are markedly below the expected level given the individual's age and level of intellectual functioning, but the other components of receptive and expressive language are relatively intact. This qualifier should not be used if the pragmatic language impairment is better explained by Autism Spectrum Disorder or by impairments in other components of receptive or expressive language.</p> <p><b>Exclusions:</b></p> <ul style="list-style-type: none"> <li>Diseases of the nervous system (Chapter 08)</li> <li>Selective mutism (6B06)</li> </ul>
<b>6A01.23</b>	<p>Developmental language disorder, with other specified language impairment</p> <p>Developmental language disorder with other specified language impairment is characterised by persistent difficulties in the acquisition, understanding, production or use of language (spoken or signed), that arise during the developmental period and cause significant limitations in the individual's ability to communicate. The pattern of specific deficits in language abilities is not adequately captured by any of the other developmental language disorder categories.</p> <p><b>Exclusions:</b></p> <ul style="list-style-type: none"> <li>Autism spectrum disorder (6A02)</li> <li>Diseases of the nervous system (Chapter 08)</li> <li>Disorders of intellectual development (6A00)</li> <li>Selective mutism (6B06)</li> </ul>

**6A01.Y Other specified developmental speech or language disorders**

**6A01.Z Developmental speech or language disorders, unspecified**

**6A02**

**Autism spectrum disorder**

Autism spectrum disorder is characterised by persistent deficits in the ability to initiate and to sustain reciprocal social interaction and social communication, and by a range of restricted, repetitive, and inflexible patterns of behaviour, interests or activities that are clearly atypical or excessive for the individual's age and sociocultural context. The onset of the disorder occurs during the developmental period, typically in early childhood, but symptoms may not become fully manifest until later, when social demands exceed limited capacities. Deficits are sufficiently severe to cause impairment in personal, family, social, educational, occupational or other important areas of functioning and are usually a pervasive feature of the individual's functioning observable in all settings, although they may vary according to social, educational, or other context. Individuals along the spectrum exhibit a full range of intellectual functioning and language abilities.

**Inclusions:** Autistic disorder

**Exclusions:** Rett syndrome (LD90.4)

**6A02.0 Autism spectrum disorder without disorder of intellectual development and with mild or no impairment of functional language**

All definitional requirements for autism spectrum disorder are met, intellectual functioning and adaptive behaviour are found to be at least within the average range (approximately greater than the 2.3rd percentile), and there is only mild or no impairment in the individual's capacity to use functional language (spoken or signed) for instrumental purposes, such as to express personal needs and desires.

**6A02.1 Autism spectrum disorder with disorder of intellectual development and with mild or no impairment of functional language**

All definitional requirements for both autism spectrum disorder and disorder of intellectual development are met and there is only mild or no impairment in the individual's capacity to use functional language (spoken or signed) for instrumental purposes, such as to express personal needs and desires.

**6A02.2 Autism spectrum disorder without disorder of intellectual development and with impaired functional language**

All definitional requirements for autism spectrum disorder are met, intellectual functioning and adaptive behaviour are found to be at least within the average range (approximately greater than the 2.3rd percentile), and there is marked impairment in functional language (spoken or signed) relative to the individual's age, with the individual not able to use more than single words or simple phrases for instrumental purposes, such as to express personal needs and desires.

**6A02.3 Autism spectrum disorder with disorder of intellectual development and with impaired functional language**

All definitional requirements for both autism spectrum disorder and disorder of intellectual development are met and there is marked impairment in functional language (spoken or signed) relative to the individual's age, with the individual not able to use more than single words or simple phrases for instrumental purposes, such as to express personal needs and desires.

<b>6A02.5</b>	<b>Autism spectrum disorder with disorder of intellectual development and with absence of functional language</b> All definitional requirements for both autism spectrum disorder and disorder of intellectual development are met and there is complete, or almost complete, absence of ability relative to the individual's age to use functional language (spoken or signed) for instrumental purposes, such as to express personal needs and desires
<b>6A02.Y</b>	<b>Other specified autism spectrum disorder</b>
<b>6A02.Z</b>	<b>Autism spectrum disorder, unspecified</b>
<b>6A03</b>	<b>Developmental learning disorder</b> Developmental learning disorder is characterised by significant and persistent difficulties in learning academic skills, which may include reading, writing, or arithmetic. The individual's performance in the affected academic skill(s) is markedly below what would be expected for chronological age and general level of intellectual functioning, and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder first manifests when academic skills are taught during the early school years. Developmental learning disorder is not due to a disorder of intellectual development, sensory impairment (vision or hearing), neurological or motor disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity. <i><b>Exclusions:</b></i> Symbolic dysfunctions (MB4B)
<b>6A03.0</b>	<b>Developmental learning disorder with impairment in reading</b> Developmental learning disorder with impairment in reading is characterised by significant and persistent difficulties in learning academic skills related to reading, such as word reading accuracy, reading fluency, and reading comprehension. The individual's performance in reading is markedly below what would be expected for chronological age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with impairment in reading is not due to a disorder of intellectual development, sensory impairment (vision or hearing), neurological disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity. <i><b>Exclusions:</b></i> Disorders of intellectual development (6A00)

- 6A03.1      Developmental learning disorder with impairment in written expression**  
Developmental learning disorder with impairment in written expression is characterised by significant and persistent difficulties in learning academic skills related to writing, such as spelling accuracy, grammar and punctuation accuracy, and organisation and coherence of ideas in writing. The individual's performance in written expression is markedly below what would be expected for chronological age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with impairment in written expression is not due to a disorder of intellectual development, sensory impairment (vision or hearing), a neurological or motor disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.
- Exclusions:**      Disorders of intellectual development (6A00)
- 6A03.2      Developmental learning disorder with impairment in mathematics**  
Developmental learning disorder with impairment in mathematics is characterised by significant and persistent difficulties in learning academic skills related to mathematics or arithmetic, such as number sense, memorization of number facts, accurate calculation, fluent calculation, and accurate mathematic reasoning. The individual's performance in mathematics or arithmetic is markedly below what would be expected for chronological or developmental age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with impairment in mathematics is not due to a disorder of intellectual development, sensory impairment (vision or hearing), a neurological disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.
- Exclusions:**      Disorders of intellectual development (6A00)
- 6A03.3      Developmental learning disorder with other specified impairment of learning**  
Developmental learning disorder with other specified impairment of learning is characterised by significant and persistent difficulties in learning academic skills other than reading, mathematics, and written expression. The individual's performance in the relevant academic skill is markedly below what would be expected for chronological age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with other specified impairment of learning is not due to a disorder of intellectual development, sensory impairment (vision or hearing), neurological disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.
- Exclusions:**      Disorders of intellectual development (6A00)
- 6A03.Z      Developmental learning disorder, unspecified**

**6A04****Developmental motor coordination disorder**

Developmental motor coordination disorder is characterised by a significant delay in the acquisition of gross and fine motor skills and impairment in the execution of coordinated motor skills that manifest in clumsiness, slowness, or inaccuracy of motor performance. Coordinated motor skills are markedly below that expected given the individual's chronological age and level of intellectual functioning. Onset of coordinated motor skills difficulties occurs during the developmental period and is typically apparent from early childhood. Coordinated motor skills difficulties cause significant and persistent limitations in functioning (e.g. in activities of daily living, school work, and vocational and leisure activities). Difficulties with coordinated motor skills are not solely attributable to a Disease of the Nervous System, Disease of the Musculoskeletal System or Connective Tissue, sensory impairment, and not better explained by a Disorder of Intellectual Development.

***Exclusions:***

Abnormalities of gait and mobility (MB44)

Diseases of the musculoskeletal system or connective tissue  
(Chapter 15)

Diseases of the nervous system (Chapter 08)

**6A05****Attention deficit hyperactivity disorder**

Attention deficit hyperactivity disorder is characterised by a persistent pattern (at least 6 months) of inattention and/or hyperactivity-impulsivity that has a direct negative impact on academic, occupational, or social functioning. There is evidence of significant inattention and/or hyperactivity-impulsivity symptoms prior to age 12, typically by early to mid-childhood, though some individuals may first come to clinical attention later. The degree of inattention and hyperactivity-impulsivity is outside the limits of normal variation expected for age and level of intellectual functioning. Inattention refers to significant difficulty in sustaining attention to tasks that do not provide a high level of stimulation or frequent rewards, distractibility and problems with organisation. Hyperactivity refers to excessive motor activity and difficulties with remaining still, most evident in structured situations that require behavioural self-control. Impulsivity is a tendency to act in response to immediate stimuli, without deliberation or consideration of the risks and consequences. The relative balance and the specific manifestations of inattentive and hyperactive-impulsive characteristics varies across individuals and may change over the course of development. In order for a diagnosis to be made, manifestations of inattention and/or hyperactivity-impulsivity must be evident across multiple situations or settings (e.g., home, school, work, with friends or relatives), but are likely to vary according to the structure and demands of the setting. Symptoms are not better accounted for by another mental, behavioural, or neurodevelopmental disorder and are not due to the effect of a substance or medication.

***Inclusions:***

attention deficit disorder with hyperactivity

attention deficit syndrome with hyperactivity

- 6A05.0** **Attention deficit hyperactivity disorder, predominantly inattentive presentation**  
All definitional requirements for attention deficit hyperactivity disorder are met and inattentive symptoms are predominant in the clinical presentation. Inattention refers to significant difficulty in sustaining attention to tasks that do not provide a high level of stimulation or frequent rewards, distractibility and problems with organisation. Some hyperactive-impulsive symptoms may also be present, but these are not clinically significant in relation to the inattentive symptoms.
- 6A05.1** **Attention deficit hyperactivity disorder, predominantly hyperactive-impulsive presentation**  
All definitional requirements for attention deficit hyperactivity disorder are met and hyperactive-impulsive symptoms are predominant in the clinical presentation. Hyperactivity refers to excessive motor activity and difficulties with remaining still, most evident in structured situations that require behavioural self-control. Impulsivity is a tendency to act in response to immediate stimuli, without deliberation or consideration of the risks and consequences. Some inattentive symptoms may also be present, but these are not clinically significant in relation to the hyperactive-impulsive symptoms.
- 6A05.2** **Attention deficit hyperactivity disorder, combined presentation**  
All definitional requirements for attention deficit hyperactivity disorder are met. Both inattentive and hyperactive-impulsive symptoms are clinically significant, with neither predominating in the clinical presentation. Inattention refers to significant difficulty in sustaining attention to tasks that do not provide a high level of stimulation or frequent rewards, distractibility and problems with organisation. Hyperactivity refers to excessive motor activity and difficulties with remaining still, most evident in structured situations that require behavioural self-control. Impulsivity is a tendency to act in response to immediate stimuli, without deliberation or consideration of the risks and consequences.
- 6A05.Y** **Attention deficit hyperactivity disorder, other specified presentation**
- 6A05.Z** **Attention deficit hyperactivity disorder, presentation unspecified**
- 6A06** **Stereotyped movement disorder**  
Stereotyped movement disorder is characterised by the persistent (e.g., lasting several months) presence of voluntary, repetitive, stereotyped, apparently purposeless (and often rhythmic) movements that arise during the early developmental period, are not caused by the direct physiological effects of a substance or medication (including withdrawal), and markedly interfere with normal activities or result in self-inflicted bodily injury. Stereotyped movements that are non-injurious can include body rocking, head rocking, finger-flicking mannerisms, and hand flapping. Stereotyped self-injurious behaviours can include repetitive head banging, face slapping, eye poking, and biting of the hands, lips, or other body parts.
- Exclusions:** Tic disorders (8A05)  
Trichotillomania (6B25.0)  
Abnormal involuntary movements (MB46)

**6A06.0      Stereotyped movement disorder without self-injury**

This category should be applied to forms of Stereotyped movement disorder in which stereotyped behaviours markedly interfere with normal activities, but do not result in self-inflicted bodily injury. Stereotyped movement disorder without self-injury is characterised by voluntary, repetitive, stereotyped, apparently purposeless (and often rhythmic) movements that arise during the early developmental period, are not caused by the direct physiological effects of a substance or medication (including withdrawal), and markedly interfere with normal activities. Stereotyped movements that are non-injurious can include body rocking, head rocking, finger-flicking mannerisms, and hand flapping.

**6A06.1      Stereotyped movement disorder with self-injury**

This category should be applied to forms of Stereotyped movement disorder in which stereotyped behaviours result in self-inflicted bodily injury that is significant enough to require medical treatment, or would result in such injury if protective measures (e.g., helmet to prevent head injury) were not employed. Stereotyped movement disorder with self-injury is characterised by voluntary, repetitive, stereotyped, apparently purposeless (and often rhythmic) movements that arise during the early developmental period, are not caused by the direct physiological effects of a substance or medication (including withdrawal). Stereotyped movements that are self-injurious can include head banging, face slapping, eye poking, and biting of the hands, lips, or other body parts.

**6A06.Z      Stereotyped movement disorder, unspecified**

**6A0Y      Other specified neurodevelopmental disorders**

**6A0Z      Neurodevelopmental disorders, unspecified**

## Schizophrenia or other primary psychotic disorders (6A20-6A2Z)

Schizophrenia and other primary psychotic disorders are characterised by significant impairments in reality testing and alterations in behaviour manifest in positive symptoms such as persistent delusions, persistent hallucinations, disorganised thinking (typically manifest as disorganized speech), grossly disorganized behaviour, and experiences of passivity and control, negative symptoms such as blunted or flat affect and avolition, and psychomotor disturbances. The symptoms occur with sufficient frequency and intensity to deviate from expected cultural or subcultural norms. These symptoms do not arise as a feature of another mental and behavioural disorder (e.g., a mood disorder, delirium, or a disorder due to substance use). The categories in this grouping should not be used to classify the expression of ideas, beliefs, or behaviours that are culturally sanctioned.

**Coded Elsewhere:** Substance-induced psychotic disorders

Secondary psychotic syndrome (6E61)

**6A20**

### Schizophrenia

Schizophrenia is characterised by disturbances in multiple mental modalities, including thinking (e.g., delusions, disorganisation in the form of thought), perception (e.g., hallucinations), self-experience (e.g., the experience that one's feelings, impulses, thoughts, or behaviour are under the control of an external force), cognition (e.g., impaired attention, verbal memory, and social cognition), volition (e.g., loss of motivation), affect (e.g., blunted emotional expression), and behaviour (e.g., behaviour that appears bizarre or purposeless, unpredictable or inappropriate emotional responses that interfere with the organisation of behaviour). Psychomotor disturbances, including catatonia, may be present. Persistent delusions, persistent hallucinations, thought disorder, and experiences of influence, passivity, or control are considered core symptoms. Symptoms must have persisted for at least one month in order for a diagnosis of schizophrenia to be assigned. The symptoms are not a manifestation of another health condition (e.g., a brain tumour) and are not due to the effect of a substance or medication on the central nervous system (e.g., corticosteroids), including withdrawal (e.g., alcohol withdrawal).

**Exclusions:** Schizotypal disorder (6A22)  
schizophrenic reaction (6A22)  
Acute and transient psychotic disorder (6A23)

**6A20.0**

### Schizophrenia, first episode

Schizophrenia, first episode should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizophrenia (including duration) but who have never before experienced an episode during which diagnostic requirements for Schizophrenia were met.

**6A20.00**

#### Schizophrenia, first episode, currently symptomatic

All definitional requirements for Schizophrenia, first episode in terms of symptoms and duration are currently met, or have been met within the past one month.

- 6A20.01** Schizophrenia, first episode, in partial remission  
All definitional requirements for Schizophrenia, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A20.02** Schizophrenia, first episode, in full remission  
All definitional requirements for Schizophrenia, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A20.0Z** Schizophrenia, first episode, unspecified
- 6A20.1** **Schizophrenia, multiple episodes**  
Schizophrenia, multiple episodes should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizophrenia and who have also previously experienced episodes during which diagnostic requirements were met, with substantial remission of symptoms between episodes. Some attenuated symptoms may remain during periods of remission, and remissions may have occurred in response to medication or other treatment.
- 6A20.10** Schizophrenia, multiple episodes, currently symptomatic  
All definitional requirements for Schizophrenia, multiple episodes in terms of symptoms and duration are currently met, or have been met within the past one month.
- 6A20.11** Schizophrenia, multiple episodes, in partial remission  
All definitional requirements for Schizophrenia, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A20.12** Schizophrenia, multiple episodes, in full remission  
All definitional requirements for Schizophrenia, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A20.1Z** Schizophrenia, multiple episodes, unspecified
- 6A20.2** **Schizophrenia, continuous**  
Symptoms fulfilling all definitional requirements of Schizophrenia have been present for almost all of the illness course over a period of at least one year, with periods of subthreshold symptoms being very brief relative to the overall course.

- 6A20.20** Schizophrenia, continuous, currently symptomatic  
All definitional requirements for Schizophrenia, continuous in terms of symptoms and duration are currently met, or have been met within the past one month.
- 6A20.21** Schizophrenia, continuous, in partial remission  
All definitional requirements for Schizophrenia, continuous in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A20.22** Schizophrenia, continuous, in full remission  
All definitional requirements for Schizophrenia, continuous in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A20.2Z** Schizophrenia, continuous, unspecified
- 6A20.Y** Other specified episode of schizophrenia
- 6A20.Z** Schizophrenia, episode unspecified

## 6A21

### Schizoaffective disorder

Schizoaffective disorder is an episodic disorder in which the diagnostic requirements of schizophrenia and a manic, mixed, or moderate or severe depressive episode are met within the same episode of illness, either simultaneously or within a few days of each other. Prominent symptoms of schizophrenia (e.g. delusions, hallucinations, disorganisation in the form of thought, experiences of influence, passivity and control) are accompanied by typical symptoms of a moderate or severe depressive episode (e.g. depressed mood, loss of interest, reduced energy), a manic episode (e.g. an extreme mood state characterised by euphoria, irritability, or expansiveness; increased activity or a subjective experience of increased energy) or a mixed episode. Psychomotor disturbances, including catatonia, may be present. Symptoms must have persisted for at least one month. The symptoms are not a manifestation of another medical condition (e.g. a brain tumor) and are not due to the effect of a substance or medication on the central nervous system (e.g. corticosteroids), including withdrawal (e.g. alcohol withdrawal).

## 6A21.0

### Schizoaffective disorder, first episode

Schizoaffective disorder, first episode should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizoaffective disorder (including duration) but who have never before experienced an episode during which diagnostic requirements for Schizoaffective disorder or Schizophrenia were met.

- 6A21.00** Schizoaffective disorder, first episode, currently symptomatic  
All definitional requirements for Schizoaffective disorder, first episode in terms of symptoms and duration are currently met, or have been met within the past one month.
- 6A21.01** Schizoaffective disorder, first episode, in partial remission  
All definitional requirements for Schizoaffective disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A21.02** Schizoaffective disorder, first episode, in full remission  
All definitional requirements for Schizoaffective disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A21.0Z** Schizoaffective disorder, first episode, unspecified
- 6A21.1** **Schizoaffective disorder, multiple episodes**  
Schizoaffective disorder, multiple episodes should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizoaffective disorder and who have also previously experienced episodes during which diagnostic requirements for Schizoaffective disorder or Schizophrenia were met, with substantial remission of symptoms between episodes. Some attenuated symptoms may remain during period of remission, and remissions may have occurred in response to medication or other treatment.
- 6A21.10** Schizoaffective disorder, multiple episodes, currently symptomatic  
All definitional requirements for Schizoaffective disorder, multiple episodes in terms of symptoms and duration are currently met, or have been met within the past one month.
- 6A21.11** Schizoaffective disorder, multiple episodes, in partial remission  
All definitional requirements for Schizoaffective disorder, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A21.12** Schizoaffective disorder, multiple episodes, in full remission  
All definitional requirements for Schizoaffective disorder, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A21.1Z** Schizoaffective disorder, multiple episodes, unspecified

- 6A21.2** **Schizoaffective disorder, continuous**  
Symptoms fulfilling all definitional requirements of Schizoaffective disorder have been present for almost all of the illness course over a period of at least one year, with periods of subthreshold symptoms being very brief relative to the overall course.
- 6A21.20** Schizoaffective disorder, continuous, currently symptomatic  
All definitional requirements for Schizoaffective disorder, continuous in terms of symptoms and duration are currently met, or have been met within the past one month.
- 6A21.21** Schizoaffective disorder, continuous, in partial remission  
All definitional requirements for Schizoaffective disorder, continuous in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A21.22** Schizoaffective disorder, continuous, in full remission  
All definitional requirements for Schizoaffective disorder, continuous in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A21.2Z** Schizoaffective disorder, continuous, unspecified
- 6A21.Y** Other specified schizoaffective disorder
- 6A21.Z** Schizoaffective disorder, unspecified
- 6A22** **Schizotypal disorder**  
Schizotypal disorder is characterised by an enduring pattern (i.e. characteristic of the person's functioning over a period of at least several years) of eccentricities in behaviour, appearance and speech, accompanied by cognitive and perceptual distortions, unusual beliefs, and discomfort with—and often reduced capacity for—interpersonal relationships. Symptoms may include constricted or inappropriate affect and anhedonia. Paranoid ideas, ideas of reference, or other psychotic symptoms, including hallucinations in any modality, may occur, but are not of sufficient intensity or duration to meet the diagnostic requirements of schizophrenia, schizoaffective disorder, or delusional disorder. The symptoms cause distress or impairment in personal, family, social, educational, occupational or other important areas of functioning.
- Inclusions:** Schizotypal personality disorder
- Exclusions:** Autism spectrum disorder (6A02)  
Personality disorder (6D10)

**6A23**

**Acute and transient psychotic disorder**

Acute and transient psychotic disorder is characterised by acute onset of psychotic symptoms that emerge without a prodrome and reach their maximal severity within two weeks. Symptoms may include delusions, hallucinations, disorganisation of thought processes, perplexity or confusion, and disturbances of affect and mood. Catatonia-like psychomotor disturbances may be present. Symptoms typically change rapidly, both in nature and intensity, from day to day, or even within a single day. The duration of the episode does not exceed 3 months, and most commonly lasts from a few days to 1 month. The symptoms are not a manifestation of another medical condition (e.g. a brain tumour) and are not due to the effect of a substance or medication on the central nervous system (e.g. corticosteroids), including withdrawal (e.g. alcohol withdrawal).

**6A23.0**

**Acute and transient psychotic disorder, first episode**

Acute and transient psychotic disorder, first episode should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for acute and transient psychotic disorder but who have never before experienced a similar episode.

**6A23.00**

Acute and transient psychotic disorder, first episode, currently symptomatic

All definitional requirements for Acute and transient psychotic disorder, first episode in terms of symptoms and duration are currently met, or have been met within the past one month.

**6A23.01**

Acute and transient psychotic disorder, first episode, in partial remission

All definitional requirements for Acute and transient psychotic disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

**6A23.02**

Acute and transient psychotic disorder, first episode, in full remission

All definitional requirements for Acute and transient psychotic disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

**6A23.0Z**

Acute and transient psychotic disorder, first episode, unspecified

**6A23.1**

**Acute and transient psychotic disorder, multiple episodes**

Acute and transient psychotic disorder, multiple episodes should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for acute and transient psychotic disorder and who have experienced similar episodes in the past.

**6A23.10**

Acute and transient psychotic disorder, multiple episodes, currently symptomatic

All definitional requirements for Acute and transient psychotic disorder, multiple episodes in terms of symptoms and duration are currently met, or have been met within the past one month.

- 6A23.11** Acute and transient psychotic disorder, multiple episodes, in partial remission  
All definitional requirements for Acute and transient psychotic disorder, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A23.12** Acute and transient psychotic disorder, multiple episodes, in full remission  
All definitional requirements for Acute and transient psychotic disorder, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A23.1Z** Acute and transient psychotic disorder, multiple episodes, unspecified
- 6A23.Y** **Other specified acute and transient psychotic disorder**
- 6A23.Z** **Acute and transient psychotic disorder, unspecified**
- 6A24**
- Delusional disorder**
- Delusional disorder is characterised by the development of a delusion or set of related delusions, typically persisting for at least 3 months and often much longer, in the absence of a Depressive, Manic, or Mixed mood episode. The delusions are variable in content across individuals, but typically stable within individuals, although they may evolve over time. Other characteristic symptoms of Schizophrenia (i.e. clear and persistent hallucinations, negative symptoms, disorganized thinking, or experiences of influence, passivity, or control) are not present, although various forms of perceptual disturbances (e.g. hallucinations, illusions, misidentifications of persons) thematically related to the delusion are still consistent with the diagnosis. Apart from actions and attitudes directly related to the delusion or delusional system, affect, speech, and behavior are typically unaffected. The symptoms are not a manifestation of another medical condition (e.g., a brain tumour) and are not due to the effect of a substance or medication on the central nervous system (e.g. corticosteroids), including withdrawal effects (e.g. alcohol withdrawal).
- 6A24.0** **Delusional disorder, currently symptomatic**  
All definitional requirements for Delusional disorder in terms of symptoms and duration are currently met, or have been met within the past one month.
- 6A24.1** **Delusional disorder, in partial remission**  
All definitional requirements for Delusional disorder in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

<b>6A24.2</b>	<b>Delusional disorder, in full remission</b> All definitional requirements for Delusional disorder in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
<b>6A24.Z</b>	<b>Delusional disorder, unspecified</b>
<b>6A25</b>	<p><b>Symptomatic manifestations of primary psychotic disorders</b></p> <p>These categories may be used to characterize the current clinical presentation in individuals diagnosed with Schizophrenia or another primary psychotic disorder, and should not be used in individuals without such a diagnosis. Multiple categories may be applied. Symptoms attributable to the direct pathophysiological consequences of a health condition or injury not classified under Mental, behavioural or neurodevelopmental disorders (e.g., a brain tumour or traumatic brain injury), or to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, should not be considered as examples of the respective types of symptoms.</p> <p><b>Coding Note:</b> These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.</p>
<b>6A25.0</b>	<p><b>Positive symptoms in primary psychotic disorders</b></p> <p>Positive symptoms in primary psychotic disorders include persistent delusions, persistent hallucinations (most commonly verbal auditory hallucinations), disorganized thinking (formal thought disorder such as loose associations, thought derailment, or incoherence), grossly disorganized behaviour (behaviour that appears bizarre, purposeless and not goal-directed) and experiences of passivity and control (the experience that one's feelings, impulses, or thoughts are under the control of an external force). The rating should be made based on the severity of positive symptoms during the past week.</p> <p><b>Coding Note:</b> These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.</p>
<b>6A25.1</b>	<p><b>Negative symptoms in primary psychotic disorders</b></p> <p>Negative symptoms in primary psychotic disorders include constricted, blunted, or flat affect, alogia or paucity of speech, avolition (general lack of drive, or lack of motivation to pursue meaningful goals), asociality (reduced or absent engagement with others and interest in social interaction) and anhedonia (inability to experience pleasure from normally pleasurable activities). To be considered negative psychotic symptoms, relevant symptoms should not be entirely attributable to antipsychotic drug treatment, a depressive disorder, or an under-stimulating environment, and should not be a direct consequence of a positive symptom (e.g., persecutory delusions causing a person to become socially isolated due to fear of harm). The rating should be made based on the severity of negative symptoms during the past week.</p> <p><b>Coding Note:</b> These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.</p>

- 6A25.2 Depressive mood symptoms in primary psychotic disorders**  
Depressive mood symptoms in primary psychotic disorders refer to depressed mood as reported by the individual (feeling down, sad) or manifested as a sign (e.g. tearful, defeated appearance). If only non-mood symptoms of a depressive episode are present (e.g., anhedonia, psychomotor slowing), this descriptor should not be used. This descriptor may be used whether or not depressive symptoms meet the diagnostic requirements of a separately diagnosed Depressive disorder. The rating should be made based on the severity of depressive mood symptoms during the past week.
- Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.
- 6A25.3 Manic mood symptoms in primary psychotic disorders**  
Manic mood symptoms in primary psychotic disorders refer to elevated, euphoric, irritable, or expansive mood states, including rapid changes among different mood states (i.e., mood lability). It also includes increased subjective experience of energy, which may be accompanied by increased goal-directed activity. The severity of associated non-mood symptoms of a Manic or Hypomanic Episode (e.g., decreased need for sleep, distractibility) should not be considered in making a rating. Increased non-goal-directed psychomotor activity should be considered as part of the rating of the 'psychomotor symptoms in primary psychotic disorders' rather than here. This descriptor may be used whether or not the manic symptoms meet the diagnostic requirements of a separately diagnosed bipolar disorder. The rating should be made based on the severity of manic mood symptoms during the past week.
- Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.
- 6A25.4 Psychomotor symptoms in primary psychotic disorders**  
Psychomotor symptoms in primary psychotic disorders include psychomotor agitation or excessive motor activity, usually manifested by purposeless behaviours such as fidgeting, shifting, fiddling, inability to sit or stand still, wringing of the hands, psychomotor retardation, or a visible generalised slowing of movements and speech, and catatonic symptoms such as excitement, posturing, waxy flexibility, negativism, mutism, or stupor. The rating should be made based on the severity of psychomotor symptoms during the past week.
- Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

**6A25.5 Cognitive symptoms in primary psychotic disorders**

Cognitive symptoms in primary psychotic disorders refer to cognitive impairment in any of the following domains: speed of processing, attention/concentration, orientation, judgment, abstraction, verbal or visual learning, and working memory. The cognitive impairment is not attributable to a neurodevelopmental disorder, a delirium or other neurocognitive disorder, or the direct effects of a substance or medication on the central nervous system, including withdrawal effects. Ideally, use of this category should be based on the results of locally validated, standardized neuropsychological assessments, although such measures may not be available in all settings. The rating should be made based on the severity of cognitive symptoms during the past week.

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

**Exclusions:**      Neurocognitive disorders (6D70-6E0Z)  
                        Neurodevelopmental disorders (6A00-6A0Z)

**6A2Y Other specified primary psychotic disorder**

**6A2Z Schizophrenia or other primary psychotic disorders, unspecified**

### Catatonia (6A40-6A4Z)

Catatonia is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abnormal psychomotor activity. The assessment of catatonia is complex and requires observation, interview and physical exam. Catatonia can occur in the context of another mental disorder, such as Schizophrenia or Other Primary Psychotic Disorders, Mood Disorders, and Neurodevelopmental Disorders, especially Autism Spectrum Disorder. Catatonia can also develop during or soon after intoxication or withdrawal from certain psychoactive substances, including phencyclidine (PCP), cannabis, hallucinogens such as mescaline or LSD, cocaine and MDMA or related drugs, or during the use of certain psychoactive and non-psychoactive medications (e.g. antipsychotic medications, benzodiazepines, steroids, disulfiram, ciprofloxacin). Finally, Catatonia can occur as a direct pathophysiological consequence of a medical condition not classified under Mental, Behavioural or Neurodevelopmental Disorders. Examples of medical conditions that may be associated with Catatonia include diabetic ketoacidosis, hypercalcemia, hepatic encephalopathy, homocystinuria, neoplasms head trauma, cerebrovascular disease, and encephalitis.

**Exclusions:**      Harmful effects of drugs, medicaments or biological substances, not elsewhere classified (NE60)

**Coded Elsewhere:** Secondary catatonia syndrome (6E69)

**6A40 Catatonia associated with another mental disorder**

Catatonia associated with another mental disorder is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abnormal psychomotor activity, which occurs in the context of another mental disorder, such as Schizophrenia or Other Primary Psychotic Disorders, Mood Disorders, and Neurodevelopmental Disorders, especially Autism Spectrum Disorder.

**6A41**

**Catatonia induced by substances or medications**

Catatonia induced by substances or medications is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abnormal psychomotor activity, which develops during or soon after intoxication or withdrawal from certain psychoactive substances, including phencyclidine (PCP), cannabis, hallucinogens such as mescaline or LSD, cocaine and MDMA or related drugs, or during the use of certain psychoactive and non-psychoactive medications (e.g. antipsychotic medications, benzodiazepines, steroids, disulfiram, ciprofloxacin).

**Exclusions:** Neuroleptic malignant syndrome (8A00-8A0Z)

Serotonin syndrome (8D85)

**6A4Z**

**Catatonia, unspecified**

**Coding Note:** Code also the causing condition

## Mood disorders (6A60-6A8Z)

Mood Disorders refers to a superordinate grouping of Bipolar and Depressive Disorders. Mood disorders are defined according to particular types of mood episodes and their pattern over time. The primary types of mood episodes are Depressive episode, Manic episode, Mixed episode, and Hypomanic episode. Mood episodes are not independently diagnosable entities, and therefore do not have their own diagnostic codes. Rather, mood episodes make up the primary components of most of the Depressive and Bipolar Disorders.

**Coded Elsewhere:** Substance-induced mood disorders  
Secondary mood syndrome (6E62)

## Bipolar or related disorders (6A60-6A6Z)

Bipolar and related disorders are episodic mood disorders defined by the occurrence of Manic, Mixed or Hypomanic episodes or symptoms. These episodes typically alternate over the course of these disorders with Depressive episodes or periods of depressive symptoms.

**6A60**

### **Bipolar type I disorder**

Bipolar type I disorder is an episodic mood disorder defined by the occurrence of one or more manic or mixed episodes. A manic episode is an extreme mood state lasting at least one week unless shortened by a treatment intervention characterised by euphoria, irritability, or expansiveness, and by increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid or pressured speech, flight of ideas, increased self-esteem or grandiosity, decreased need for sleep, distractibility, impulsive or reckless behaviour, and rapid changes among different mood states (i.e., mood lability). A mixed episode is characterised by the presence of several prominent manic and several prominent depressive symptoms consistent with those observed in manic episodes and depressive episodes, which either occur simultaneously or alternate very rapidly (from day to day or within the same day). Symptoms must include an altered mood state consistent with a manic and/or depressive episode (i.e., depressed, dysphoric, euphoric or expansive mood), and be present most of the day, nearly every day, during a period of at least 2 weeks, unless shortened by a treatment intervention. Although the diagnosis can be made based on evidence of a single manic or mixed episode, typically manic or mixed episodes alternate with depressive episodes over the course of the disorder.

**Exclusions:** Cyclothymia (6A62)  
Bipolar type II disorder (6A61)

**6A60.0**

**Bipolar type I disorder, current episode manic, without psychotic symptoms**

Bipolar type I disorder, current episode manic, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met, the current episode is manic, and there are no delusions or hallucinations present during the episode. A manic episode is an extreme mood state lasting at least one week unless shortened by a treatment intervention characterised by euphoria, irritability, or expansiveness, and by increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid or pressured speech, flight of ideas, increased self-esteem or grandiosity, decreased need for sleep, distractibility, impulsive or reckless behaviour, and rapid changes among different mood states (i.e., mood lability). If the individual has experienced Manic or Mixed Episodes in the past, a duration of one week is not required in order to diagnose a current episode if all other diagnostic requirements are met.

**6A60.1**

**Bipolar type I disorder, current episode manic, with psychotic symptoms**

Bipolar type I disorder, current episode manic with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I Disorder have been met, the current episode is Manic and there are delusions or hallucinations present during the episode. A manic episode is an extreme mood state lasting at least one week unless shortened by a treatment intervention characterised by euphoria, irritability, or expansiveness, and by increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid or pressured speech, flight of ideas, increased self-esteem or grandiosity, decreased need for sleep, distractibility, impulsive or reckless behaviour, and rapid changes among different mood states (i.e., mood lability). If the individual has experienced Manic or Mixed Episodes in the past, a duration of one week is not required in order to diagnose a current episode if all other diagnostic requirements are met.

**6A60.2**

**Bipolar type I disorder, current episode hypomanic**

Bipolar type I disorder, current episode hypomanic is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is hypomanic. A hypomanic episode is a persistent mood state lasting at least several days characterised by mild elevation of mood or increased irritability and increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid speech, rapid or racing thoughts, increased self-esteem, an increase in sexual drive or sociability, decreased need for sleep, distractibility, or impulsive or reckless behaviour. The symptoms are not severe enough to cause marked impairment in occupational functioning or in usual social activities or relationships with others, does not necessitate hospitalization, and there are no accompanying delusions or hallucinations.

**6A60.3**

**Bipolar type I disorder, current episode depressive, mild**

Bipolar type I disorder, current episode depressive, mild is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive at a mild level of severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one or more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

**6A60.4**

**Bipolar type I disorder, current episode depressive, moderate without psychotic symptoms**

Bipolar type I disorder, current episode depressive, moderate, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive at a moderate level of severity and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A60.5**

**Bipolar type I disorder, current episode depressive, moderate with psychotic symptoms**

Bipolar type I disorder, current episode depressive, moderate, with psychotic symptoms diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive at a moderate level of severity and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A60.6**

**Bipolar type I disorder, current episode depressive, severe without psychotic symptoms**

Bipolar type I disorder, current episode depressive, severe, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

**6A60.7**

**Bipolar type I disorder, current episode depressive, severe with psychotic symptoms**

Bipolar type I disorder, current episode depressive, severe, with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

**6A60.8**

**Bipolar type I disorder, current episode depressive, unspecified severity**

Bipolar type I disorder, current episode depressive, unspecified severity is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive, but there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.

- 6A60.9 Bipolar type I disorder, current episode mixed, without psychotic symptoms**  
Bipolar type I disorder, current episode mixed, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is mixed and there are no delusions or hallucinations present during the episode. A mixed episode is characterised by the presence of several prominent manic and several prominent depressive symptoms consistent with those observed in manic episodes and depressive episodes, which either occur simultaneously or alternate very rapidly (from day to day or within the same day). Symptoms must include an altered mood state consistent with a manic and/or depressive episode (i.e., depressed, dysphoric, euphoric or expansive mood), and be present most of the day, nearly every day, during a period of at least 2 weeks, unless shortened by a treatment intervention. If the individual has experienced Manic or Mixed Episodes in the past, a duration of 2 weeks is not required in order to diagnose a current episode if all other diagnostic requirements are met.
- 6A60.A Bipolar type I disorder, current episode mixed, with psychotic symptoms**  
Bipolar type I disorder, current episode mixed, with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is mixed and there are delusions or hallucinations present during the episode. A mixed episode is characterised by the presence of several prominent manic and several prominent depressive symptoms consistent with those observed in manic episodes and depressive episodes, which either occur simultaneously or alternate very rapidly (from day to day or within the same day). Symptoms must include an altered mood state consistent with a manic and/or depressive episode (i.e., depressed, dysphoric, euphoric or expansive mood), and be present most of the day, nearly every day, during a period of at least 2 weeks, unless shortened by a treatment intervention. If the individual has experienced Manic or Mixed Episodes in the past, a duration of 2 weeks is not required in order to diagnose a current episode if all other diagnostic requirements are met.
- 6A60.B Bipolar type I disorder, currently in partial remission, most recent episode manic or hypomanic**  
Bipolar type I disorder, currently in partial remission, most recent episode manic or hypomanic is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the most recent episode was a manic or hypomanic episode. The full definitional requirements for a manic or hypomanic episode are no longer met but some significant mood symptoms remain. In some cases, residual mood symptoms may be depressive rather than manic or hypomanic, but do not satisfy the definitional requirements for a depressive episode.
- 6A60.C Bipolar type I disorder, currently in partial remission, most recent episode depressive**  
Bipolar type I disorder, currently in partial remission, most recent episode depressive is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the most recent episode was a depressive episode. The full definitional requirements for the episode are no longer met but some significant depressive symptoms remain.

- 6A60.D** **Bipolar type I disorder, currently in partial remission, most recent episode mixed**  
Bipolar type I disorder, currently in partial remission, most recent episode mixed is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the most recent episode was a mixed episode. The full definitional requirements for the episode are no longer met but some significant mood symptoms remain.
- 6A60.E** **Bipolar type I disorder, currently in partial remission, most recent episode unspecified**  
Bipolar type I disorder, currently in partial remission, most recent episode unspecified is diagnosed when the definitional requirements for Bipolar type I disorder have been met but there is insufficient information to determine the nature of the most recent mood episode. The full definitional requirements for a mood episode are no longer met but some significant mood symptoms remain.
- 6A60.F** **Bipolar type I disorder, currently in full remission**  
Bipolar type I disorder, currently in full remission is diagnosed when the full definitional requirements for Bipolar I disorder have been met in the past but there are no longer any significant mood symptoms.
- 6A60.Y** **Other specified bipolar type I disorder**
- 6A60.Z** **Bipolar type I disorder, unspecified**
- 6A61** **Bipolar type II disorder**  
Bipolar type II disorder is an episodic mood disorder defined by the occurrence of one or more hypomanic episodes and at least one depressive episode. A hypomanic episode is a persistent mood state lasting for at least several days characterised by persistent elevation of mood or increased irritability as well as increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as increased talkativeness, rapid or racing thoughts, increased self-esteem, decreased need for sleep, distractability, and impulsive or reckless behavior. The symptoms represent a change from the individual's typical mood, energy level, and behavior but are not severe enough to cause marked impairment in functioning. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as changes in appetite or sleep, psychomotor agitation or retardation, fatigue, feelings of worthless or excessive or inappropriate guilt, feelings or hopelessness, difficulty concentrating, and suicidality. There is no history of manic or mixed episodes.

**6A61.0**

**Bipolar type II disorder, current episode hypomanic**

Bipolar type II disorder, current episode hypomanic is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is hypomanic. A hypomanic episode is a persistent mood state lasting at least several days characterised by mild elevation of mood or increased irritability and increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid speech, rapid or racing thoughts, increased self-esteem, an increase in sexual drive or sociability, decreased need for sleep, distractibility, or impulsive or reckless behaviour. The symptoms are not severe enough to cause marked impairment in occupational functioning or in usual social activities or relationships with others, does not necessitate hospitalization, and there are no accompanying delusions or hallucinations.

**6A61.1**

**Bipolar type II disorder, current episode depressive, mild**

Bipolar type II disorder, current episode depressive, mild is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive at a mild level of severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one or more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

**6A61.2**

**Bipolar type II disorder, current episode depressive, moderate without psychotic symptoms**

Bipolar type II disorder, current episode depressive, moderate, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive at a moderate level of severity and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

- 6A61.3 Bipolar type II disorder, current episode depressive, moderate with psychotic symptoms**
- Bipolar type II disorder, current episode depressive, moderate, with psychotic symptoms diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive at a moderate level of severity and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).
- 6A61.4 Bipolar type II disorder, current episode depressive, severe without psychotic symptoms**
- Bipolar type II disorder, current episode depressive, severe, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type II disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).
- 6A61.5 Bipolar type II disorder, current episode depressive, severe with psychotic symptoms**
- Bipolar type II disorder, current episode depressive, severe, with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type II disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

- 6A61.6 Bipolar type II disorder, current episode depressive, unspecified severity**  
Bipolar type II disorder, current episode depressive, unspecified severity is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive, but there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.
- 6A61.7 Bipolar type II disorder, currently in partial remission, most recent episode hypomanic**  
Bipolar type II disorder, currently in partial remission, most recent episode hypomanic is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the most recent episode was a hypomanic episode. The full definitional requirements for a hypomanic episode are no longer met but some significant mood symptoms remain. In some cases, residual mood symptoms may be depressive rather than hypomanic, but do not satisfy the definitional requirements for a depressive episode.
- 6A61.8 Bipolar type II disorder, currently in partial remission, most recent episode depressive**  
Bipolar type II disorder, currently in partial remission, most recent episode depressive is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the most recent episode was a depressive episode. The full definitional requirements for the episode are no longer met but some significant depressive symptoms remain.
- 6A61.9 Bipolar type II disorder, currently in partial remission, most recent episode unspecified**  
Bipolar type II disorder, currently in partial remission, most recent episode unspecified is diagnosed when the definitional requirements for Bipolar type II disorder have been met but there is insufficient information to determine the nature of the most recent mood episode. The full definitional requirements for a mood episode are no longer met but some significant mood symptoms remain.
- 6A61.A Bipolar type II disorder, currently in full remission**  
Bipolar type II disorder, currently in full remission, is diagnosed when the definitional requirements for Bipolar type II disorder have been met but there are no longer any significant mood symptoms.
- 6A61.Y Other specified bipolar type II disorder**
- 6A61.Z Bipolar type II disorder, unspecified**

**6A62**

### **Cyclothymic disorder**

Cyclothymic disorder is characterised by a persistent instability of mood over a period of at least 2 years, involving numerous periods of hypomanic (e.g., euphoria, irritability, or expansiveness, psychomotor activation) and depressive (e.g., feeling down, diminished interest in activities, fatigue) symptoms that are present during more of the time than not. The hypomanic symptomatology may or may not be sufficiently severe or prolonged to meet the full definitional requirements of a hypomanic episode (see Bipolar type II disorder), but there is no history of manic or mixed episodes (see Bipolar type I disorder). The depressive symptomatology has never been sufficiently severe or prolonged to meet the diagnostic requirements for a depressive episode (see Bipolar type II disorder). The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Inclusions:**      Cycloid personality  
                         Cyclothymic personality

**6A6Y**

### **Other specified bipolar or related disorders**

**6A6Z**

### **Bipolar or related disorders, unspecified**

Depressive disorders (6A70-6A7Z)

Depressive disorders are characterised by depressive mood (e.g., sad, irritable, empty) or loss of pleasure accompanied by other cognitive, behavioural, or neurovegetative symptoms that significantly affect the individual's ability to function. A depressive disorder should not be diagnosed in individuals who have ever experienced a manic, mixed or hypomanic episode, which would indicate the presence of a bipolar disorder.

**Coded Elsewhere:** Premenstrual dysphoric disorder (GA34.41)

**6A70**

### **Single episode depressive disorder**

Single episode depressive disorder is characterised by the presence or history of one depressive episode when there is no history of prior depressive episodes. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. There have never been any prior manic, hypomanic, or mixed episodes, which would indicate the presence of a bipolar disorder.

**Exclusions:**      recurrent depressive disorder (6A71)  
                         Adjustment disorder (6B43)  
                         Bipolar or related disorders (6A60-6A6Z)

**6A70.0**

**Single episode depressive disorder, mild**

Single episode depressive disorder, mild, is diagnosed when the definitional requirements of a Depressive episode are met and the episode is of mild severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one or more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

**6A70.1**

**Single episode depressive disorder, moderate, without psychotic symptoms**

Single episode depressive disorder, moderate, without psychotic symptoms is diagnosed when the definitional requirements of a depressive episode have been met, there is no history of prior depressive episodes, the episode is of moderate severity, and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A70.2**

**Single episode depressive disorder, moderate, with psychotic symptoms**

Single episode depressive disorder, moderate, with psychotic symptoms is diagnosed when the definitional requirements of a depressive episode have been met, there is no history of prior depressive episodes, the episode is of moderate severity, and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A70.3**

**Single episode depressive disorder, severe, without psychotic symptoms**

Single episode depressive disorder, severe, without psychotic symptoms is diagnosed when the definitional requirements for Single episode depressive disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

**Inclusions:**      Major depression single episode without psychotic symptoms  
                          Vital depression single episode without psychotic symptoms

**6A70.4**

**Single episode depressive disorder, severe, with psychotic symptoms**

Single episode depressive disorder, severe, with psychotic symptoms is diagnosed when the definitional requirements for Single episode depressive disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains). In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

**6A70.5**

**Single episode depressive disorder, unspecified severity**

Single episode depressive disorder, unspecified severity is diagnosed when the definitional requirements of a depressive episode have been met, there is no history of prior depressive episodes, and there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.

- 6A70.6 Single episode depressive disorder, currently in partial remission**  
Single episode depressive disorder, currently in partial remission, is diagnosed when the full definitional requirements for a depressive episode have been met and there is no history of prior depressive episodes. The full definitional requirements for a depressive episode are no longer met but some significant mood symptoms remain.
- 6A70.7 Single episode depressive disorder, currently in full remission**  
Single episode depressive disorder, currently in full remission is diagnosed when the full definitional requirements for one depressive episode have been met in the past and there are no longer any significant mood symptoms. There is no history of depressive episodes preceding the episode under consideration.
- 6A70.Y Other specified single episode depressive disorder**
- 6A70.Z Single episode depressive disorder, unspecified**
- 6A71 Recurrent depressive disorder**  
Recurrent depressive disorder is characterised by a history of at least two depressive episodes separated by at least several months without significant mood disturbance. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. There have never been any prior manic, hypomanic, or mixed episodes, which would indicate the presence of a Bipolar disorder.
- Inclusions:** seasonal depressive disorder
- Exclusions:** Adjustment disorder (6B43)  
Bipolar or related disorders (6A60-6A6Z)  
Single episode depressive disorder (6A70)
- 6A71.0 Recurrent depressive disorder, current episode mild**  
Recurrent depressive disorder, current episode mild is diagnosed when the definitional requirements for Recurrent depressive disorder have been met and there is currently a depressive episode of mild severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one or more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

**6A71.1**

**Recurrent depressive disorder, current episode moderate, without psychotic symptoms**

Recurrent depressive disorder, current episode moderate, without psychotic symptoms is diagnosed when the definitional requirements for recurrent depressive disorder have been met and there is currently a depressive episode of moderate severity, and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A71.2**

**Recurrent depressive disorder, current episode moderate, with psychotic symptoms**

Recurrent depressive disorder, current episode moderate, with psychotic symptoms is diagnosed when the definitional requirements for Recurrent depressive disorder have been met and there is currently a depressive episode of moderate severity, and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A71.3**

**Recurrent depressive disorder, current episode severe, without psychotic symptoms**

Recurrent depressive disorder, current episode severe, without psychotic symptoms is diagnosed when the definitional requirements for Recurrent depressive disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

- Inclusions:**
- Endogenous depression without psychotic symptoms
  - Major depression, recurrent without psychotic symptoms
  - Manic-depressive psychosis, depressed type without psychotic symptoms
  - Vital depression, recurrent without psychotic symptoms

**6A71.4**

**Recurrent depressive disorder, current episode severe, with psychotic symptoms**

Recurrent depressive disorder, current episode severe, with psychotic symptoms is diagnosed when the definitional requirements for Recurrent depressive disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains). In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

- Inclusions:**
- Endogenous depression with psychotic symptoms
  - Manic-depressive psychosis, depressed type with psychotic symptoms

- 6A71.5 Recurrent depressive disorder, current episode, unspecified severity**  
Recurrent depressive disorder current episode, unspecified severity is diagnosed when the definitional requirements of a depressive episode have been met and there is a history of prior depressive episodes, but there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of almost daily depressed mood or diminished interest in activities lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.
- 6A71.6 Recurrent depressive disorder, currently in partial remission**  
Recurrent depressive disorder, currently in partial remission, is diagnosed when the definitional requirements for Recurrent depressive disorder have been met; the full definitional requirements for a depressive episode are no longer met but some significant mood symptoms remain.
- 6A71.7 Recurrent depressive disorder, currently in full remission**  
Recurrent depressive disorder, currently in full remission is diagnosed when the definitional requirements for recurrent depressive disorder have been met but currently there are no significant mood symptoms.
- 6A71.Y Other specified recurrent depressive disorder**
- 6A71.Z Recurrent depressive disorder, unspecified**
- 6A72 Dysthymic disorder**  
Dysthymic disorder is characterised by a persistent depressive mood (i.e., lasting 2 years or more), for most of the day, for more days than not. In children and adolescents depressed mood can manifest as pervasive irritability. The depressed mood is accompanied by additional symptoms such as markedly diminished interest or pleasure in activities, reduced concentration and attention or indecisiveness, low self-worth or excessive or inappropriate guilt, hopelessness about the future, disturbed sleep or increased sleep, diminished or increased appetite, or low energy or fatigue. During the first 2 years of the disorder, there has never been a 2-week period during which the number and duration of symptoms were sufficient to meet the diagnostic requirements for a Depressive Episode. There is no history of Manic, Mixed, or Hypomanic Episodes.
- Inclusions:** Dysthymia
- Exclusions:** anxiety depression (mild or not persistent) (6A73)

**6A73****Mixed depressive and anxiety disorder**

Mixed depressive and anxiety disorder is characterised by symptoms of both anxiety and depression more days than not for a period of two weeks or more. Depressive symptoms include depressed mood or markedly diminished interest or pleasure in activities. There are multiple anxiety symptoms, which may include feeling nervous, anxious, or on edge, not being able to control worrying thoughts, fear that something awful will happen, having trouble relaxing, muscle tension, or sympathetic autonomic symptoms. Neither set of symptoms, considered separately, is sufficiently severe, numerous, or persistent to justify a diagnosis of another depressive disorder or an anxiety or fear-related disorder. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning. There is no history of manic or mixed episodes, which would indicate the presence of a bipolar disorder.

**6A7Y****Other specified depressive disorders****6A7Z****Depressive disorders, unspecified****6A80****Symptomatic and course presentations for mood episodes in mood disorders**

These categories may be applied to describe the presentation and characteristics of mood episodes in the context of single episode depressive disorder, recurrent depressive disorder, bipolar type I disorder, or bipolar type II disorder. These categories indicate the presence of specific, important features of the clinical presentation or of the course, onset, and pattern of mood episodes. These categories are not mutually exclusive, and as many may be added as apply.

**Coding Note:**

These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

**Coded Elsewhere:** Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, without psychotic symptoms (6E20)

Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, with psychotic symptoms (6E21)

**6A80.0****Prominent anxiety symptoms in mood episodes**

In the context of a current depressive, manic, mixed, or hypomanic episode, prominent and clinically significant anxiety symptoms (e.g., feeling nervous, anxious or on edge, not being able to control worrying thoughts, fear that something awful will happen, having trouble relaxing, motor tension, autonomic symptoms) have been present for most of the time during the episode. If there have been panic attacks during a current depressive or mixed episode, these should be recorded separately.

When the diagnostic requirements for both a mood disorder and an anxiety or fear-related disorder are met, the anxiety or fear-related disorder should also be diagnosed.

**Coding Note:**

These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

<b>6A80.1</b>	<b>Panic attacks in mood episodes</b> In the context of a current mood episode (manic, depressive, mixed, or hypomanic), there have been recurrent panic attacks (i.e., at least two) during the past month that occur specifically in response to anxiety-provoking cognitions that are features of the mood episode. If panic attacks occur exclusively in response to such thoughts, panic attacks should be recorded using this qualifier rather than assigning an additional co-occurring diagnosis of panic disorder.  If some panic attacks over the course of the depressive or mixed episode have been unexpected and not exclusively in response to depressive or anxiety-provoking thoughts, a separate diagnosis of panic disorder should be assigned.
<b>Coding Note:</b>	These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.
	<b>Exclusions:</b> Panic disorder (6B01)
<b>6A80.2</b>	<b>Current depressive episode persistent</b> The diagnostic requirements for a depressive episode are currently met and have been met continuously for at least the past 2 years.
<b>Coding Note:</b>	These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.
<b>6A80.3</b>	<b>Current depressive episode with melancholia</b> In the context of a current Depressive Episode, several of the following symptoms have been present during the worst period of the current episode: loss of interest or pleasure in most activities that are normally enjoyable to the individual (i.e., pervasive anhedonia); lack of emotional reactivity to normally pleasurable stimuli or circumstances (i.e., mood does not lift even transiently with exposure); terminal insomnia (i.e., waking in the morning two hours or more before the usual time); depressive symptoms are worse in the morning; marked psychomotor retardation or agitation; marked loss of appetite or loss of weight.
<b>Coding Note:</b>	These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.
<b>6A80.4</b>	<b>Seasonal pattern of mood episode onset</b> In the context of recurrent depressive disorder, bipolar type I or bipolar type II disorder, there has been a regular seasonal pattern of onset and remission of at least one type of episode (i.e., depressive, manic, mixed, or hypomanic episodes), with a substantial majority of the relevant mood episodes corresponding to the seasonal pattern. (In bipolar type I and bipolar type II disorder, all types of mood episodes may not follow this pattern.) A seasonal pattern should be differentiated from an episode that is coincidental with a particular season but predominantly related to a psychological stressor that regularly occurs at that time of the year (e.g., seasonal unemployment).
<b>Coding Note:</b>	These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

**6A80.5      Rapid cycling**

In the context of bipolar type I or bipolar type II disorder, there has been a high frequency of mood episodes (at least four) over the past 12 months. There may be a switch from one polarity of mood to the other, or the mood episodes may be demarcated by a period of remission. In individuals with a high frequency of mood episodes, some may have a shorter duration than those usually observed in bipolar type I or bipolar type II disorder. In particular, depressive periods may only last several days. If depressive and manic symptoms alternate very rapidly (i.e., from day to day or within the same day), a mixed episode should be diagnosed rather than rapid cycling.

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

**6A8Y      Other specified mood disorders**

**6A8Z      Mood disorders, unspecified**

## Anxiety or fear-related disorders (6B00-6B0Z)

Anxiety and fear-related disorders are characterised by excessive fear and anxiety and related behavioural disturbances, with symptoms that are severe enough to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. Fear and anxiety are closely related phenomena; fear represents a reaction to perceived imminent threat in the present, whereas anxiety is more future-oriented, referring to perceived anticipated threat. A key differentiating feature among the Anxiety and fear-related disorders are disorder-specific foci of apprehension, that is, the stimulus or situation that triggers the fear or anxiety. The clinical presentation of Anxiety and fear-related disorders typically includes specific associated cognitions that can assist in differentiating among the disorders by clarifying the focus of apprehension.

**Coded Elsewhere:** Substance-induced anxiety disorders

Hypochondriasis (6B23)

Secondary anxiety syndrome (6E63)

**6B00**

### Generalised anxiety disorder

Generalised anxiety disorder is characterised by marked symptoms of anxiety that persist for at least several months, for more days than not, manifested by either general apprehension (i.e. 'free-floating anxiety') or excessive worry focused on multiple everyday events, most often concerning family, health, finances, and school or work, together with additional symptoms such as muscular tension or motor restlessness, sympathetic autonomic over-activity, subjective experience of nervousness, difficulty maintaining concentration, irritability, or sleep disturbance. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. The symptoms are not a manifestation of another health condition and are not due to the effects of a substance or medication on the central nervous system.

**6B01****Panic disorder**

Panic disorder is characterised by recurrent unexpected panic attacks that are not restricted to particular stimuli or situations. Panic attacks are discrete episodes of intense fear or apprehension accompanied by the rapid and concurrent onset of several characteristic symptoms (e.g. palpitations or increased heart rate, sweating, trembling, shortness of breath, chest pain, dizziness or lightheadedness, chills, hot flushes, fear of imminent death). In addition, panic disorder is characterised by persistent concern about the recurrence or significance of panic attacks, or behaviours intended to avoid their recurrence, that results in significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. The symptoms are not a manifestation of another medical condition and are not due to the effects of a substance or medication on the central nervous system.

**Exclusions:**      Panic attack (MB23.H)

**6B02****Agoraphobia**

Agoraphobia is characterised by marked and excessive fear or anxiety that occurs in response to multiple situations where escape might be difficult or help might not be available, such as using public transportation, being in crowds, being outside the home alone (e.g., in shops, theatres, standing in line). The individual is consistently anxious about these situations due to a fear of specific negative outcomes (e.g., panic attacks, other incapacitating or embarrassing physical symptoms). The situations are actively avoided, entered only under specific circumstances such as in the presence of a trusted companion, or endured with intense fear or anxiety. The symptoms persist for at least several months, and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

**6B03****Specific phobia**

Specific phobia is characterised by a marked and excessive fear or anxiety that consistently occurs upon exposure or anticipation of exposure to one or more specific objects or situations (e.g., proximity to certain animals, flying, heights, closed spaces, sight of blood or injury) that is out of proportion to actual danger. The phobic objects or situations are avoided or else endured with intense fear or anxiety. Symptoms persist for at least several months and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

**Inclusions:**      Simple phobia

**Exclusions:**      Body dysmorphic disorder (6B21)

Hypochondriasis (6B23)

**6B04**

### **Social anxiety disorder**

Social anxiety disorder is characterised by marked and excessive fear or anxiety that consistently occurs in one or more social situations such as social interactions (e.g. having a conversation), doing something while feeling observed (e.g. eating or drinking in the presence of others), or performing in front of others (e.g. giving a speech). The individual is concerned that he or she will act in a way, or show anxiety symptoms, that will be negatively evaluated by others. Relevant social situations are consistently avoided or else endured with intense fear or anxiety. The symptoms persist for at least several months and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

**6B05**

### **Separation anxiety disorder**

Separation anxiety disorder is characterised by marked and excessive fear or anxiety about separation from specific attachment figures. In children and adolescents, separation anxiety typically focuses on caregivers, parents or other family members and the fear or anxiety is beyond what would be considered developmentally normative. In adults, the focus is typically a romantic partner or children. Manifestations of separation anxiety may include thoughts of harm or untoward events befalling the attachment figure, reluctance to go to school or work, recurrent excessive distress upon separation, reluctance or refusal to sleep away from the attachment figure, and recurrent nightmares about separation. The symptoms persist for at least several months and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

- Exclusions:**
- mood [affective] disorders (6A60-6A8Z)
  - Selective mutism (6B06)
  - Social anxiety disorder (6B04)

**6B06**

### **Selective mutism**

Selective mutism is characterised by consistent selectivity in speaking, such that a child demonstrates adequate language competence in specific social situations, typically at home, but consistently fails to speak in others, typically at school. The disturbance lasts for at least one month, is not limited to the first month of school, and is of sufficient severity to interfere with educational achievement or with social communication. Failure to speak is not due to a lack of knowledge of, or comfort with, the spoken language required in the social situation (e.g. a different language spoken at school than at home).

- Exclusions:**
- Schizophrenia (6A20)
  - transient mutism as part of separation anxiety in young children (6B05)
  - Autism spectrum disorder (6A02)

**6B0Y**

### **Other specified anxiety or fear-related disorders**

**6B0Z**

### **Anxiety or fear-related disorders, unspecified**

## **Obsessive-compulsive or related disorders (6B20-6B2Z)**

Obsessive-compulsive and related disorders is a group of disorders characterised by repetitive thoughts and behaviours that are believed to share similarities in aetiology and key diagnostic validators. Cognitive phenomena such as obsessions, intrusive thoughts and preoccupations are central to a subset of these conditions (i.e., obsessive-compulsive disorder, body dysmorphic disorder, hypochondriasis, and olfactory reference disorder) and are accompanied by related repetitive behaviours. Hoarding Disorder is not associated with intrusive unwanted thoughts but rather is characterised by a compulsive need to accumulate possessions and distress related to discarding them. Also included in the grouping are body-focused repetitive behaviour disorders, which are primarily characterised by recurrent and habitual actions directed at the integument (e.g., hair-pulling, skin-picking) and lack a prominent cognitive aspect. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

**Coded Elsewhere:** Substance-induced obsessive-compulsive or related disorders

Secondary obsessive-compulsive or related syndrome (6E64)

Tourette syndrome (8A05.00)

**6B20**

### **Obsessive-compulsive disorder**

Obsessive-Compulsive Disorder is characterised by the presence of persistent obsessions or compulsions, or most commonly both. Obsessions are repetitive and persistent thoughts, images, or impulses/urges that are intrusive, unwanted, and are commonly associated with anxiety. The individual attempts to ignore or suppress obsessions or to neutralize them by performing compulsions. Compulsions are repetitive behaviours including repetitive mental acts that the individual feels driven to perform in response to an obsession, according to rigid rules, or to achieve a sense of 'completeness'. In order for obsessive-compulsive disorder to be diagnosed, obsessions and compulsions must be time consuming (e.g. taking more than an hour per day) or result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Inclusions:** anankastic neurosis

obsessive-compulsive neurosis

**Exclusions:** obsessive compulsive behaviour (MB23.4)

**6B20.0**

### **Obsessive-compulsive disorder with fair to good insight**

All definitional requirements of obsessive-compulsive disorder are met. Much of the time, the individual is able to entertain the possibility that his or her disorder-specific beliefs may not be true and is willing to accept an alternative explanation for his or her experience. At circumscribed times (e.g., when highly anxious), the individual may demonstrate no insight.

**6B20.1**

### **Obsessive-compulsive disorder with poor to absent insight**

All definitional requirements of obsessive-compulsive disorder are met. Most or all of the time, the individual is convinced that the disorder-specific beliefs are true and cannot accept an alternative explanation for their experience. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

**6B20.Z**

### **Obsessive-compulsive disorder, unspecified**

**6B21****Body dysmorphic disorder**

Body Dysmorphic Disorder is characterised by persistent preoccupation with one or more perceived defects or flaws in appearance that are either unnoticeable or only slightly noticeable to others. Individuals experience excessive self-consciousness, often with ideas of reference (i.e., the conviction that people are taking notice, judging, or talking about the perceived defect or flaw). In response to their preoccupation, individuals engage in repetitive and excessive behaviours that include repeated examination of the appearance or severity of the perceived defect or flaw, excessive attempts to camouflage or alter the perceived defect, or marked avoidance of social situations or triggers that increase distress about the perceived defect or flaw. The symptoms are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Exclusions:** Anorexia Nervosa (6B80)  
Bodily distress disorder (6C20)  
Concern about body appearance (QD30-QD3Z)

**6B21.0****Body dysmorphic disorder with fair to good insight**

All definitional requirements of body dysmorphic disorder are met. Much of the time, the individual is able to entertain the possibility that his or her disorder-specific beliefs may not be true and is willing to accept an alternative explanation for his or her experience. At circumscribed times (e.g., when highly anxious), the individual may demonstrate no insight.

**6B21.1****Body dysmorphic disorder with poor to absent insight**

All definitional requirements of body dysmorphic disorder are met. Most or all of the time, the individual is convinced that the disorder-specific beliefs are true and cannot accept an alternative explanation for their experience. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

**6B21.Z****Body dysmorphic disorder, unspecified****6B22****Olfactory reference disorder**

Olfactory Reference Disorder is characterised by persistent preoccupation with the belief that one is emitting a perceived foul or offensive body odour or breath that is either unnoticeable or only slightly noticeable to others. Individuals experience excessive self-consciousness about the perceived odour, often with ideas of reference (i.e., the conviction that people are taking notice, judging, or talking about the odour). In response to their preoccupation, individuals engage in repetitive and excessive behaviours such as repeatedly checking for body odour or checking the perceived source of the smell, or repeatedly seeking reassurance, excessive attempts to camouflage, alter, or prevent the perceived odour, or marked avoidance of social situations or triggers that increase distress about the perceived foul or offensive odour. The symptoms are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

- 6B22.0 Olfactory reference disorder with fair to good insight**  
All definitional requirements of olfactory reference disorder are met. Much of the time, the individual is able to entertain the possibility that his or her disorder-specific beliefs may not be true and is willing to accept an alternative explanation for his or her experience. At circumscribed times (e.g., when highly anxious), the individual may demonstrate no insight.
- 6B22.1 Olfactory reference disorder with poor to absent insight**  
All definitional requirements of olfactory reference disorder are met. Most or all of the time, the individual is convinced that the disorder-specific beliefs are true and cannot accept an alternative explanation for their experience. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.
- 6B22.Z Olfactory reference disorder, unspecified**
- 6B23 Hypochondriasis**  
Hypochondriasis is characterised by persistent preoccupation or fear about the possibility of having one or more serious, progressive or life-threatening illnesses. The preoccupation is accompanied by either: 1) repetitive and excessive health-related behaviours, such as repeatedly checking the body for evidence of illness, spending inordinate amounts of time searching for information about the feared illness, repeatedly seeking reassurance (e.g. arranging multiple medical consultations); or 2) maladaptive avoidance behaviour related to health (e.g. avoids medical appointments). The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.
- Inclusions:** Hypochondriacal neurosis  
Illness anxiety disorder
- Exclusions:** Body dysmorphic disorder (6B21)  
Bodily distress disorder (6C20)  
Fear of cancer (MG24.0)
- 6B23.0 Hypochondriasis with fair to good insight**  
All definitional requirements of hypochondriasis are met. Much of the time, the individual is able to entertain the possibility that his or her disorder-specific beliefs may not be true and is willing to accept an alternative explanation for his or her experience. At circumscribed times (e.g., when highly anxious), the individual may demonstrate no insight.
- 6B23.1 Hypochondriasis with poor to absent insight**  
All definitional requirements of hypochondriasis are met. Most or all of the time, the individual is convinced that the disorder-specific beliefs are true and cannot accept an alternative explanation for their experience. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.
- 6B23.Z Hypochondriasis, unspecified**

**6B24**

### **Hoarding disorder**

Hoarding disorder is characterised by accumulation of possessions that results in living spaces becoming cluttered to the point that their use or safety is compromised. Accumulation occurs due to both repetitive urges or behaviours related to amassing items and difficulty discarding possessions due to a perceived need to save items and distress associated with discarding them. If living areas are uncluttered this is only due to the intervention of third parties (e.g., family members, cleaners, authorities). Amassment may be passive (e.g. accumulation of incoming flyers or mail) or active (e.g. excessive acquisition of free, purchased, or stolen items). The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B24.0**

#### **Hoarding disorder with fair to good insight**

All definitional requirements of hoarding disorder are met. The individual recognizes that hoarding-related beliefs and behaviours (pertaining to excessive acquisition, difficulty discarding, or clutter) are problematic. This qualifier level may still be applied if, at circumscribed times (e.g., when being forced to discard items), the individual demonstrates no insight.

**6B24.1**

#### **Hoarding disorder with poor to absent insight**

All definitional requirements of hoarding disorder are met. Most or all of the time, the individual is convinced that that hoarding-related beliefs and behaviours (pertaining to excessive acquisition, difficulty discarding, or clutter) are not problematic, despite evidence to the contrary. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

**6B24.Z**

#### **Hoarding disorder, unspecified**

**6B25**

### **Body-focused repetitive behaviour disorders**

Body focused repetitive behaviour disorders are characterised by recurrent and habitual actions directed at the integument (e.g. hair-pulling, skin-picking, lip-biting), typically accompanied by unsuccessful attempts to decrease or stop the behaviour involved, and which lead to dermatological sequelae (e.g., hair loss, skin lesions, lip abrasions). The behaviour may occur in brief episodes scattered throughout the day or in less frequent but more sustained periods. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B25.0**

### **Trichotillomania**

Trichotillomania is characterised by recurrent pulling of one's own hair leading to significant hair loss, accompanied by unsuccessful attempts to decrease or stop the behaviour. Hair pulling may occur from any region of the body in which hair grows but the most common sites are the scalp, eyebrows, and eyelids. Hair pulling may occur in brief episodes scattered throughout the day or in less frequent but more sustained periods. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Inclusions:** Compulsive hair plucking

**Exclusions:** stereotyped movement disorder with hair-plucking (6A06)

<b>6B25.1</b>	<b>Excoriation disorder</b> Excoriation disorder is characterised by recurrent picking of one's own skin leading to skin lesions, accompanied by unsuccessful attempts to decrease or stop the behaviour. The most commonly picked sites are the face, arms and hands, but many individuals pick from multiple body sites. Skin picking may occur in brief episodes scattered throughout the day or in less frequent but more sustained periods. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.
	<b>Inclusions:</b> skin picking disorder
	<b>Exclusions:</b> Stereotyped movement disorder (6A06) Acute excoriation of skin (ME62.9) Chronic excoriation of skin (ME63.7)
<b>6B25.Y</b>	<b>Other specified body-focused repetitive behaviour disorders</b>
<b>6B25.Z</b>	<b>Body-focused repetitive behaviour disorders, unspecified</b>
<b>6B2Y</b>	<b>Other specified obsessive-compulsive or related disorders</b>
<b>6B2Z</b>	<b>Obsessive-compulsive or related disorders, unspecified</b>

## Disorders specifically associated with stress (6B40-6B4Z)

Disorders specifically associated with stress are directly related to exposure to a stressful or traumatic event, or a series of such events or adverse experiences. For each of the disorders in this grouping, an identifiable stressor is a necessary, though not sufficient, causal factor. Although not all individuals exposed to an identified stressor will develop a disorder, the disorders in this grouping would not have occurred without experiencing the stressor. Stressful events for some disorders in this grouping are within the normal range of life experiences (e.g., divorce, socio-economic problems, bereavement). Other disorders require the experience of a stressor of an extremely threatening or horrific nature (i.e., potentially traumatic events). With all disorders in this grouping, it is the nature, pattern, and duration of the symptoms that arise in response to the stressful events—together with associated functional impairment—that distinguishes the disorders.

- Exclusions:**      Burnout (QD85)  
                        Acute stress reaction (QE84)

**6B40**

### **Post traumatic stress disorder**

Post traumatic stress disorder (PTSD) may develop following exposure to an extremely threatening or horrific event or series of events. It is characterised by all of the following: 1) re-experiencing the traumatic event or events in the present in the form of vivid intrusive memories, flashbacks, or nightmares. Re-experiencing may occur via one or multiple sensory modalities and is typically accompanied by strong or overwhelming emotions, particularly fear or horror, and strong physical sensations; 2) avoidance of thoughts and memories of the event or events, or avoidance of activities, situations, or people reminiscent of the event(s); and 3) persistent perceptions of heightened current threat, for example as indicated by hypervigilance or an enhanced startle reaction to stimuli such as unexpected noises. The symptoms persist for at least several weeks and cause significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

- Inclusions:**      Traumatic neurosis  
**Exclusions:**      Acute stress reaction (QE84)  
                        Complex post traumatic stress disorder (6B41)

**6B41**

### **Complex post traumatic stress disorder**

Complex post traumatic stress disorder (Complex PTSD) is a disorder that may develop following exposure to an event or series of events of an extremely threatening or horrific nature, most commonly prolonged or repetitive events from which escape is difficult or impossible (e.g. torture, slavery, genocide campaigns, prolonged domestic violence, repeated childhood sexual or physical abuse). All diagnostic requirements for PTSD are met. In addition, Complex PTSD is characterised by severe and persistent 1) problems in affect regulation; 2) beliefs about oneself as diminished, defeated or worthless, accompanied by feelings of shame, guilt or failure related to the traumatic event; and 3) difficulties in sustaining relationships and in feeling close to others. These symptoms cause significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

- Exclusions:**      Post traumatic stress disorder (6B40)  
                        Personality disorder (6D10)

**6B42**

### **Prolonged grief disorder**

Prolonged grief disorder is a disturbance in which, following the death of a partner, parent, child, or other person close to the bereaved, there is persistent and pervasive grief response characterised by longing for the deceased or persistent preoccupation with the deceased accompanied by intense emotional pain (e.g. sadness, guilt, anger, denial, blame, difficulty accepting the death, feeling one has lost a part of one's self, an inability to experience positive mood, emotional numbness, difficulty in engaging with social or other activities). The grief response has persisted for an atypically long period of time following the loss (more than 6 months at a minimum) and clearly exceeds expected social, cultural or religious norms for the individual's culture and context. Grief reactions that have persisted for longer periods that are within a normative period of grieving given the person's cultural and religious context are viewed as normal bereavement responses and are not assigned a diagnosis. The disturbance causes significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B43**

### **Adjustment disorder**

Adjustment disorder is a maladaptive reaction to an identifiable psychosocial stressor or multiple stressors (e.g. divorce, illness or disability, socio-economic problems, conflicts at home or work) that usually emerges within a month of the stressor. The disorder is characterised by preoccupation with the stressor or its consequences, including excessive worry, recurrent and distressing thoughts about the stressor, or constant rumination about its implications, as well as by failure to adapt to the stressor that causes significant impairment in personal, family, social, educational, occupational or other important areas of functioning. The symptoms are not better explained by another mental disorder (e.g., Mood Disorder, another Disorder Specifically Associated with Stress) and typically resolve within 6 months, unless the stressor persists for a longer duration.

- Exclusions:**
- separation anxiety disorder of childhood (6B05)
  - Recurrent depressive disorder (6A71)
  - Single episode depressive disorder (6A70)
  - Prolonged grief disorder (6B42)
  - Uncomplicated bereavement (QE62)
  - Burnout (QD85)
  - Acute stress reaction (QE84)

**6B44****Reactive attachment disorder**

Reactive attachment disorder is characterised by grossly abnormal attachment behaviours in early childhood, occurring in the context of a history of grossly inadequate child care (e.g., severe neglect, maltreatment, institutional deprivation). Even when an adequate primary caregiver is newly available, the child does not turn to the primary caregiver for comfort, support and nurture, rarely displays security-seeking behaviours towards any adult, and does not respond when comfort is offered. Reactive attachment disorder can only be diagnosed in children, and features of the disorder develop within the first 5 years of life. However, the disorder cannot be diagnosed before the age of 1 year (or a developmental age of less than 9 months), when the capacity for selective attachments may not be fully developed, or in the context of Autism spectrum disorder.

**Exclusions:** Asperger syndrome (6A02)  
disinhibited attachment disorder of childhood (6B45)

**6B45****Disinhibited social engagement disorder**

Disinhibited social engagement disorder is characterised by grossly abnormal social behaviour, occurring in the context of a history of grossly inadequate child care (e.g., severe neglect, institutional deprivation). The child approaches adults indiscriminately, lacks reticence to approach, will go away with unfamiliar adults, and exhibits overly familiar behaviour towards strangers. Disinhibited social engagement disorder can only be diagnosed in children, and features of the disorder develop within the first 5 years of life. However, the disorder cannot be diagnosed before the age of 1 year (or a developmental age of less than 9 months), when the capacity for selective attachments may not be fully developed, or in the context of Autism spectrum disorder.

**Exclusions:** Asperger syndrome (6A02)  
Adjustment disorder (6B43)  
Attention deficit hyperactivity disorder (6A05)  
reactive attachment disorder of childhood (6B44)

**6B4Y****Other specified disorders specifically associated with stress****6B4Z****Disorders specifically associated with stress, unspecified**

## Dissociative disorders (6B60-6B6Z)

Dissociative disorders are characterised by involuntary disruption or discontinuity in the normal integration of one or more of the following: identity, sensations, perceptions, affects, thoughts, memories, control over bodily movements, or behaviour. Disruption or discontinuity may be complete, but is more commonly partial, and can vary from day to day or even from hour to hour. The symptoms of dissociative disorders are not due to the direct effects of a medication or substance, including withdrawal effects, are not better explained by another Mental, behavioural, or neurodevelopmental disorder, a Sleep-wake disorder, a Disease of the nervous system or other health condition, and are not part of an accepted cultural, religious, or spiritual practice. Dissociative symptoms in dissociative disorders are sufficiently severe to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Coded Elsewhere:** Secondary dissociative syndrome (6E65)

**6B60**

### **Dissociative neurological symptom disorder**

Dissociative neurological symptom disorder is characterised by the presentation of motor, sensory, or cognitive symptoms that imply an involuntary discontinuity in the normal integration of motor, sensory, or cognitive functions and are not consistent with a recognised disease of the nervous system, other mental or behavioural disorder, or other medical condition. The symptoms do not occur exclusively during another dissociative disorder and are not due to the effects of a substance or medication on the central nervous system, including withdrawal effects, or a Sleep-Wake disorder.

**Exclusions:** Factitious disorders (6D50-6D5Z)

**6B60.0**

### **Dissociative neurological symptom disorder, with visual disturbance**

Dissociative neurological symptom disorder, with visual disturbance is characterised by visual symptoms such as blindness, tunnel vision, diplopia, visual distortions or hallucinations that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

**6B60.1**

### **Dissociative neurological symptom disorder, with auditory disturbance**

Dissociative neurological symptom disorder, with auditory disturbance is characterised by auditory symptoms such as loss of hearing or auditory hallucinations that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

**6B60.2**

### **Dissociative neurological symptom disorder, with vertigo or dizziness**

Dissociative neurological symptom disorder, with vertigo or dizziness is characterised by a sensation of spinning while stationary (vertigo) or dizziness that is not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and does not occur exclusively during another dissociative disorder.

- 6B60.3 Dissociative neurological symptom disorder, with other sensory disturbance**  
Dissociative neurological symptom disorder, with other sensory disturbance is characterised by sensory symptoms not identified in other specific categories in this grouping such as numbness, tightness, tingling, burning, pain, or other symptoms related to touch, smell, taste, balance, proprioception, kinesthesia, or thermoception. The symptoms are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.4 Dissociative neurological symptom disorder, with non-epileptic seizures**  
Dissociative neurological symptom disorder, with non-epileptic seizures is characterised by a symptomatic presentation of seizures or convulsions that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.5 Dissociative neurological symptom disorder, with speech disturbance**  
Dissociative neurological symptom disorder, with speech disturbance is characterised by symptoms such as difficulty with speaking (dysphonia), loss of the ability to speak (aphonia) or difficult or unclear articulation of speech (dysarthria) that are not consistent with a recognised disease of the nervous system, a neurodevelopmental or neurocognitive disorder, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.6 Dissociative neurological symptom disorder, with paresis or weakness**  
Dissociative neurological symptom disorder, with paresis or weakness is characterised by a difficulty or inability to intentionally move parts of the body or to coordinate movements that is not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and does not occur exclusively during another dissociative disorder.
- 6B60.7 Dissociative neurological symptom disorder, with gait disturbance**  
Dissociative neurological symptom disorder, with gait disturbance is characterised by symptoms involving the individual's ability or manner of walking, including ataxia and the inability to stand unaided, that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.8 Dissociative neurological symptom disorder, with movement disturbance**  
Dissociative neurological symptom disorder, with movement disturbance is characterised by symptoms such as chorea, myoclonus, tremor, dystonia, facial spasm, parkinsonism, or dyskinesia that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

- 6B60.80** Dissociative neurological symptom disorder, with chorea  
Dissociative neurological symptom disorder, with chorea is characterised by irregular, non-repetitive, brief, jerky, flowing movements that move randomly from one part of the body to another that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.81** Dissociative neurological symptom disorder, with myoclonus  
Dissociative neurological symptom disorder, with myoclonus is characterised by sudden rapid jerks that may be focal, multifocal or generalised that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.82** Dissociative neurological symptom disorder, with tremor  
Dissociative neurological symptom disorder, with tremor is characterised by involuntary oscillation of a body part that is not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and does not occur exclusively during another dissociative disorder.
- 6B60.83** Dissociative neurological symptom disorder, with dystonia  
Dissociative neurological symptom disorder, with dystonia is characterised by sustained muscle contractions that frequently cause twisting and repetitive movements or abnormal postures that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.84** Dissociative neurological symptom disorder, with facial spasm  
Dissociative neurological symptom disorder, with facial spasm is characterised by involuntary muscle contractions or twitching of the face that is not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and does not occur exclusively during another dissociative disorder.
- 6B60.85** Dissociative neurological symptom disorder, with Parkinsonism  
Dissociative neurological symptom disorder, with Parkinsonism is characterised by a symptomatic presentation of a Parkinson-like syndrome in the absence of confirmed Parkinson disease that does not occur exclusively during another mental, behavioural or neurodevelopmental disorder, other medical condition, or another dissociative disorder. Dissociative neurological symptom disorder, with Parkinsonism can be distinguished from Parkinson disease by features such as abrupt onset, early disability, bilateral shaking and slowness, nondecremental slowness when performing repetitive movements, voluntary resistance against passive movement without cogwheel rigidity, distractability, 'give-way' weakness, stuttering speech, bizarre gait, and a variety of behavioural symptoms.
- 6B60.8Y** Dissociative neurological symptom disorder, with other specified movement disturbance

<b>6B60.8Z</b>	Dissociative neurological symptom disorder, with unspecified movement disturbance
<b>6B60.9</b>	<b>Dissociative neurological symptom disorder, with cognitive symptoms</b> Dissociative neurological symptom disorder, with cognitive symptoms is characterised by impaired cognitive performance in memory, language or other cognitive domains that is internally inconsistent and not consistent with a recognised disease of the nervous system, a neurodevelopmental or neurocognitive disorder, other mental, behavioural or neurodevelopmental disorder, or another medical condition and does not occur exclusively during another dissociative disorder.
	<b>Exclusions:</b> Dissociative amnesia (6B61)
<b>6B60.Y</b>	<b>Dissociative neurological symptom disorder, with other specified symptoms</b>
<b>6B60.Z</b>	<b>Dissociative neurological symptom disorder, with unspecified symptoms</b>
<b>6B61</b>	<p><b>Dissociative amnesia</b></p> <p>Dissociative amnesia is characterised by an inability to recall important autobiographical memories, typically of recent traumatic or stressful events, that is inconsistent with ordinary forgetting. The amnesia does not occur exclusively during another dissociative disorder and is not better explained by another mental, behavioural or neurodevelopmental disorder. The amnesia is not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and is not due to a disease of the nervous system or to head trauma. The amnesia results in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.</p> <p><b>Exclusions:</b> amnesia NOS (MB21.1) Amnestic disorder due to use of alcohol (6D72.10) Anterograde amnesia (MB21.10) Retrograde amnesia (MB21.11) nonalcoholic organic amnesic syndrome (6D72.0) postictal amnesia in epilepsy (8A60-8A6Z)</p>
<b>6B61.0</b>	<p><b>Dissociative amnesia with dissociative fugue</b></p> <p>Dissociative amnesia with dissociative fugue is characterised by all of the features of Dissociative Amnesia, accompanied by dissociative fugue, i.e., a loss of a sense of personal identity and sudden travel away from home, work, or significant others for an extended period of time (days or weeks). A new identity may be assumed.</p> <p><b>Exclusions:</b> postictal fugue in epilepsy (8A60-8A6Z)</p>
<b>6B61.1</b>	<p><b>Dissociative amnesia without dissociative fugue</b></p> <p>Dissociative amnesia without dissociative fugue is characterised by all of the features of dissociative amnesia occurring in the absence of symptoms of dissociative fugue.</p>
<b>6B61.Z</b>	<b>Dissociative amnesia, unspecified</b>

**6B62**

### **Trance disorder**

Trance disorder is characterised by trance states in which there is a marked alteration in the individual's state of consciousness or a loss of the individual's customary sense of personal identity in which the individual experiences a narrowing of awareness of immediate surroundings or unusually narrow and selective focusing on environmental stimuli and restriction of movements, postures, and speech to repetition of a small repertoire that is experienced as being outside of one's control. The trance state is not characterised by the experience of being replaced by an alternate identity. Trance episodes are recurrent or, if the diagnosis is based on a single episode, the episode has lasted for at least several days. The trance state is involuntary and unwanted and is not accepted as a part of a collective cultural or religious practice. The symptoms do not occur exclusively during another dissociative disorder and are not better explained by another mental, behavioural or neurodevelopmental disorder. The symptoms are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, exhaustion, or to hypnagogic or hypnopompic states, and are not due to a disease of the nervous system, head trauma, or a sleep-wake disorder. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B63**

### **Possession trance disorder**

Possession trance disorder is characterised by trance states in which there is a marked alteration in the individual's state of consciousness and the individual's customary sense of personal identity is replaced by an external 'possessing' identity and in which the individual's behaviours or movements are experienced as being controlled by the possessing agent. Possession trance episodes are recurrent or, if the diagnosis is based on a single episode, the episode has lasted for at least several days. The possession trance state is involuntary and unwanted and is not accepted as a part of a collective cultural or religious practice. The symptoms do not occur exclusively during another dissociative disorder and are not better explained by another mental, behavioural or neurodevelopmental disorder. The symptoms are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, exhaustion, or to hypnagogic or hypnopompic states, and are not due to a disease of the nervous system or a sleep-wake disorder. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

- Exclusions:**
- Schizophrenia (6A20)
  - Disorders due to use of other specified psychoactive substances, including medications (6C4E)
  - Acute and transient psychotic disorder (6A23)
  - Secondary personality change (6E68)

**6B64**

### **Dissociative identity disorder**

Dissociative identity disorder is characterised by disruption of identity in which there are two or more distinct personality states (dissociative identities) associated with marked discontinuities in the sense of self and agency. Each personality state includes its own pattern of experiencing, perceiving, conceiving, and relating to self, the body, and the environment. At least two distinct personality states recurrently take executive control of the individual's consciousness and functioning in interacting with others or with the environment, such as in the performance of specific aspects of daily life such as parenting, or work, or in response to specific situations (e.g., those that are perceived as threatening). Changes in personality state are accompanied by related alterations in sensation, perception, affect, cognition, memory, motor control, and behaviour. There are typically episodes of amnesia, which may be severe. The symptoms are not better explained by another mental, behavioural or neurodevelopmental disorder and are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and are not due to a disease of the nervous system or a sleep-wake disorder. The symptoms result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B65**

### **Partial dissociative identity disorder**

Partial dissociative identity disorder is characterised by disruption of identity in which there are two or more distinct personality states (dissociative identities) associated with marked discontinuities in the sense of self and agency. Each personality state includes its own pattern of experiencing, perceiving, conceiving, and relating to self, the body, and the environment. One personality state is dominant and normally functions in daily life, but is intruded upon by one or more non-dominant personality states (dissociative intrusions). These intrusions may be cognitive, affective, perceptual, motor, or behavioural. They are experienced as interfering with the functioning of the dominant personality state and are typically aversive. The non-dominant personality states do not recurrently take executive control of the individual's consciousness and functioning, but there may be occasional, limited and transient episodes in which a distinct personality state assumes executive control to engage in circumscribed behaviours, such as in response to extreme emotional states or during episodes of self-harm or the reenactment of traumatic memories. The symptoms are not better explained by another mental, behavioural or neurodevelopmental disorder and are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and are not due to a disease of the nervous system or a sleep-wake disorder. The symptoms result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B66****Depersonalization-derealization disorder**

Depersonalization-derealization disorder is characterised by persistent or recurrent experiences of depersonalization, derealization, or both. Depersonalization is characterised by experiencing the self as strange or unreal, or feeling detached from, or as though one were an outside observer of, one's thoughts, feelings, sensations, body, or actions. Derealization is characterised by experiencing other persons, objects, or the world as strange or unreal (e.g., dreamlike, distant, foggy, lifeless, colourless, or visually distorted) or feeling detached from one's surroundings. During experiences of depersonalization or derealization, reality testing remains intact. The experiences of depersonalization or derealization do not occur exclusively during another dissociative disorder and are not better explained by another mental, behavioural or neurodevelopmental disorder. The experiences of depersonalization or derealization are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and are not due to a disease of the nervous system or to head trauma. The symptoms result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B6Y****Other specified dissociative disorders****6B6Z****Dissociative disorders, unspecified****Feeding or eating disorders (6B80-6B8Z)**

Feeding and Eating Disorders involve abnormal eating or feeding behaviours that are not explained by another health condition and are not developmentally appropriate or culturally sanctioned. Feeding disorders involve behavioural disturbances that are not related to body weight and shape concerns, such as eating of non-edible substances or voluntary regurgitation of foods. Eating disorders involve abnormal eating behaviour and preoccupation with food as well as prominent body weight and shape concerns.

**6B80****Anorexia Nervosa**

Anorexia Nervosa is characterised by significantly low body weight for the individual's height, age and developmental stage that is not due to another health condition or to the unavailability of food. A commonly used threshold is body mass index (BMI) less than 18.5 kg/m<sup>2</sup> in adults and BMI-for-age under 5th percentile in children and adolescents. Rapid weight loss (e.g. more than 20% of total body weight within 6 months) may replace the low body weight guideline as long as other diagnostic requirements are met. Children and adolescents may exhibit failure to gain weight as expected based on the individual developmental trajectory rather than weight loss. Low body weight is accompanied by a persistent pattern of behaviours to prevent restoration of normal weight, which may include behaviours aimed at reducing energy intake (restricted eating), purging behaviours (e.g. self-induced vomiting, misuse of laxatives), and behaviours aimed at increasing energy expenditure (e.g. excessive exercise), typically associated with a fear of weight gain. Low body weight or shape is central to the person's self-evaluation or is inaccurately perceived to be normal or even excessive.

- 6B80.0** **Anorexia Nervosa with significantly low body weight**  
Anorexia Nervosa with significantly low body weight meets all definitional requirements for Anorexia Nervosa, with BMI between 18.5 kg/m<sup>2</sup> and 14.0 kg/m<sup>2</sup> for adults or between the fifth percentile and the 0.3 percentile for BMI-for-age in children and adolescents.
- 6B80.00** Anorexia Nervosa with significantly low body weight, restricting pattern  
Anorexia Nervosa with significantly low body weight, restricting pattern refers to individuals who meet the definitional requirements of Anorexia Nervosa with significantly low body weight and who induce weight loss and maintain low body weight through restricted food intake or fasting alone or in combination with increased energy expenditure (such as through excessive exercise) but who do not engage in binge eating or purging behaviours.
- 6B80.01** Anorexia Nervosa with significantly low body weight, binge-purge pattern  
Anorexia Nervosa with significantly low body weight, binge-purge pattern refers to individuals who meet the definitional requirements of Anorexia Nervosa with significantly low body weight and who present with episodes of binge eating or purging behaviours. These individuals induce weight loss and maintain low body weight through restricted food intake, commonly accompanied by significant purging behaviours aimed at getting rid of ingested food (e.g. self-induced vomiting, laxative abuse or enemas). This pattern also includes individuals who exhibit binge eating episodes but do not purge.
- 6B80.0Z** Anorexia Nervosa with significantly low body weight, unspecified
- 6B80.1** **Anorexia Nervosa with dangerously low body weight**  
Anorexia Nervosa with dangerously low body weight meets all definitional requirements for Anorexia Nervosa, with BMI under 14.0 kg/m<sup>2</sup> in adults or under the 0.3rd percentile for BMI-for-age in children and adolescents. In the context of Anorexia Nervosa, severe underweight status is an important prognostic factor that is associated with high risk of physical complications and substantially increased mortality.
- 6B80.10** Anorexia Nervosa with dangerously low body weight, restricting pattern  
Anorexia Nervosa with dangerously low body weight, restricting pattern refers to individuals who meet the definitional requirements of Anorexia Nervosa with dangerously low body weight and who induce weight loss and maintain low body weight through restricted food intake or fasting alone or in combination with increased energy expenditure (such as through excessive exercise) but who do not engage in binge eating or purging behaviours.
- 6B80.11** Anorexia Nervosa with dangerously low body weight, binge-purge pattern  
Anorexia Nervosa with dangerously low body weight, binge-purge pattern refers to individuals who meet the definitional requirements of Anorexia Nervosa with dangerously low body weight and who present with episodes of binge eating or purging behaviours. These individuals induce weight loss and maintain low body weight through restricted food intake, commonly accompanied by significant purging behaviours aimed at getting rid of ingested food (e.g. self-induced vomiting, laxative abuse or enemas). This pattern also includes individuals who exhibit binge eating episodes but do not purge.

**6B80.1Z** Anorexia Nervosa with dangerously low body weight, unspecified

**6B80.2** **Anorexia Nervosa in recovery with normal body weight**

Among individuals who are recovering from Anorexia Nervosa and whose body weight is more than 18.5 kg/m<sup>2</sup> for adults or over the fifth percentile for BMI-for-age for children and adolescents, the diagnosis should be retained until a full and lasting recovery is achieved, as indicated by the maintenance of a healthy weight and the cessation of behaviours aimed at reducing body weight independent of the provision of treatment (e.g., for at least 1 year after intensive treatment is withdrawn).

**6B80.Y** **Other specified anorexia Nervosa**

**6B80.Z** **Anorexia Nervosa, unspecified**

**6B81** **Bulimia Nervosa**

Bulimia Nervosa is characterised by frequent, recurrent episodes of binge eating (e.g. once a week or more over a period of at least one month). A binge eating episode is a distinct period of time during which the individual experiences a subjective loss of control over eating, eating notably more or differently than usual, and feels unable to stop eating or limit the type or amount of food eaten. Binge eating is accompanied by repeated inappropriate compensatory behaviours aimed at preventing weight gain (e.g. self-induced vomiting, misuse of laxatives or enemas, strenuous exercise). The individual is preoccupied with body shape or weight, which strongly influences self-evaluation. There is marked distress about the pattern of binge eating and inappropriate compensatory behaviour or significant impairment in personal, family, social, educational, occupational or other important areas of functioning. The individual does not meet the diagnostic requirements of Anorexia Nervosa.

**Exclusions:** Binge eating disorder (6B82)

**6B82** **Binge eating disorder**

Binge eating disorder is characterised by frequent, recurrent episodes of binge eating (e.g. once a week or more over a period of several months). A binge eating episode is a distinct period of time during which the individual experiences a subjective loss of control over eating, eating notably more or differently than usual, and feels unable to stop eating or limit the type or amount of food eaten. Binge eating is experienced as very distressing, and is often accompanied by negative emotions such as guilt or disgust. However, unlike in Bulimia Nervosa, binge eating episodes are not regularly followed by inappropriate compensatory behaviours aimed at preventing weight gain (e.g. self-induced vomiting, misuse of laxatives or enemas, strenuous exercise). There is marked distress about the pattern of binge eating or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Exclusions:** Bulimia Nervosa (6B81)

**6B83**

### Avoidant-restrictive food intake disorder

Avoidant-restrictive food intake disorder (ARFID) is characterised by avoidance or restriction of food intake that results in: 1) the intake of an insufficient quantity or variety of food to meet adequate energy or nutritional requirements that has resulted in significant weight loss, clinically significant nutritional deficiencies, dependence on oral nutritional supplements or tube feeding, or has otherwise negatively affected the physical health of the individual; or 2) significant impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to avoidance or distress related to participating in social experiences involving eating). The pattern of eating behaviour is not motivated by preoccupation with body weight or shape. Restricted food intake and its effects on weight, other aspects of health, or functioning are not due to unavailability of food, not a manifestation of another medical condition (e.g. food allergies, hyperthyroidism) or mental disorder, and are not due to the effect of a substance or medication on the central nervous system including withdrawal effects.

**Exclusions:** Anorexia Nervosa (6B80)  
Feeding problem of infant (MG43.30)  
Feeding problems of newborn (KD32)

**6B84**

### Pica

Pica is characterised by the regular consumption of non-nutritive substances, such as non-food objects and materials (e.g., clay, soil, chalk, plaster, plastic, metal and paper) or raw food ingredients (e.g., large quantities of salt or corn flour) that is persistent or severe enough to require clinical attention in an individual who has reached a developmental age at which they would be expected to distinguish between edible and non-edible substances (approximately 2 years). That is, the behaviour causes damage to health, impairment in functioning, or significant risk due to the frequency, amount or nature of the substances or objects ingested.

**6B85**

### Rumination-regurgitation disorder

Rumination-regurgitation disorder is characterised by the intentional and repeated bringing up of previously swallowed food back to the mouth (i.e., regurgitation), which may be re-chewed and re-swallowed (i.e. rumination), or may be deliberately spat out (but not as in vomiting). The regurgitation behaviour is frequent (at least several times per week) and sustained over a period of at least several weeks. The regurgitation behaviour is not fully accounted for by another medical condition that directly causes regurgitation (e.g., oesophageal strictures or neuromuscular disorders affecting oesophageal functioning) or causes nausea or vomiting (e.g. pyloric stenosis). Rumination-regurgitation disorder should only be diagnosed in individuals who have reached a developmental age of at least 2 years.

**Exclusions:** Adult rumination syndrome (DD90.6)  
Nausea or vomiting (MD90)

**6B8Y**

### Other specified feeding or eating disorders

**6B8Z**

### Feeding or eating disorders, unspecified

## Elimination disorders (6C00-6C0Z)

Elimination disorders include the repeated voiding of urine into clothes or bed (enuresis) and the repeated passage of faeces in inappropriate places (encopresis). Elimination disorders should only be diagnosed after the individual has reached a developmental age when continence is ordinarily expected (5 years for enuresis and 4 years for encopresis). The urinary or faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder or bowel control. An Elimination disorder should not be diagnosed if the behaviour is fully attributable to another health condition that causes incontinence, congenital or acquired abnormalities of the urinary tract or bowel, or excessive use of laxatives or diuretics.

### 6C00

#### Enuresis

Enuresis is the repeated voiding of urine into clothes or bed, which may occur during the day or at night, in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional. Enuresis should not be diagnosed if unintentional voiding of urine is due to a health condition that interferes with continence (e.g., diseases of the nervous system or musculoskeletal disorders) or by congenital or acquired abnormalities of the urinary tract.

- Inclusions:**
- Functional enuresis
  - Psychogenic enuresis
  - Urinary incontinence of nonorganic origin
- Exclusions:**
- Stress incontinence (MF50.20)
  - Urge Incontinence (MF50.21)
  - Functional urinary incontinence (MF50.23)
  - Overflow Incontinence (MF50.2)
  - Reflex incontinence (MF50.24)
  - Extraurethral urinary incontinence (MF50.2)

### 6C00.0

#### Nocturnal enuresis

Nocturnal enuresis refers to repeated voiding of urine into clothes or bed that occurs only during sleep (i.e., during the night) in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional.

### 6C00.1

#### Diurnal enuresis

Diurnal enuresis refers to repeated voiding of urine into clothes that occurs only during waking hours in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional.

- 6C00.2 Nocturnal and diurnal enuresis**  
Nocturnal and diurnal enuresis refers to repeated voiding of urine into clothes or bed that occurs both during sleep (i.e., during the night) and during waking hours in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional.
- 6C00.Z Enuresis, unspecified**
- 6C01 Encopresis**  
Encopresis is the repeated passage of faeces in inappropriate places. Encopresis should be diagnosed if inappropriate passage of faeces occurs repeatedly (e.g., at least once per month over a period of several months) in an individual who has reached the developmental age when faecal continence is ordinarily expected (4 years). The faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bowel control. Encopresis should not be diagnosed if faecal soiling is fully attributable to another health condition (e.g., aganglionic megacolon, spina bifida, dementia), congenital or acquired abnormalities of the bowel, gastrointestinal infection, or excessive use of laxatives.
- 6C01.0 Encopresis with constipation or overflow incontinence**  
Encopresis is the repeated passage of faeces in inappropriate places occurring repeatedly (e.g., at least once per month over a period of several months) in an individual who has reached the developmental age when faecal continence is ordinarily expected (4 years). The faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bowel control. Encopresis with constipation and overflow incontinence is the most common form of faecal soiling, and involves retention and impaction of faeces. Stools are typically — but not always — poorly formed (loose or liquid) and leakage may range from occasional to continuous. There is often a history of toilet avoidance leading to constipation.
- 6C01.1 Encopresis without constipation or overflow incontinence**  
Encopresis is the repeated passage of faeces in inappropriate places occurring repeatedly (e.g., at least once per month over a period of several months) in an individual who has reached the developmental age when faecal continence is ordinarily expected (4 years). The faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bowel control. Encopresis without constipation and overflow is not associated with retention and impaction of faeces, but rather reflects reluctance, resistance or failure to conform to social norms in defecating in acceptable places in the context of normal physiological control over defecation. Stools are typically of normal consistency and inappropriate defecation is likely to be intermittent.
- 6C01.Z Encopresis, unspecified**
- 6C0Z Elimination disorders, unspecified**

## Disorders of bodily distress or bodily experience (6C20-6C2Z)

Disorders of bodily distress and bodily experience are characterised by disturbances in the person's experience of his or her body. Bodily distress disorder involves bodily symptoms that the individual finds distressing and to which excessive attention is directed. Body integrity dysphoria involves a disturbance in the person's experience of the body manifested by the persistent desire to have a specific physical disability accompanied by persistent discomfort, or intense feelings of inappropriateness concerning current non-disabled body configuration.

- Exclusions:**
- Dissociative neurological symptom disorder (6B60)
  - Concern about body appearance (QD30-QD3Z)

**6C20**

### Bodily distress disorder

Bodily distress disorder is characterised by the presence of bodily symptoms that are distressing to the individual and excessive attention directed toward the symptoms, which may be manifest by repeated contact with health care providers. If another health condition is causing or contributing to the symptoms, the degree of attention is clearly excessive in relation to its nature and progression. Excessive attention is not alleviated by appropriate clinical examination and investigations and appropriate reassurance. Bodily symptoms are persistent, being present on most days for at least several months. Typically, bodily distress disorder involves multiple bodily symptoms that may vary over time. Occasionally there is a single symptom—usually pain or fatigue—that is associated with the other features of the disorder. The symptoms and associated distress and preoccupation have at least some impact on the individual's functioning (e.g. strain in relationships, less effective academic or occupational functioning, abandonment of specific leisure activities).

- Exclusions:**
- Tourette syndrome (8A05.00)
  - Hair pulling disorder (6B25.0)
  - Dissociative disorders (6B60-6B6Z)
  - hair-plucking (6B25.0)
  - Hypochondriasis (6B23)
  - Body dysmorphic disorder (6B21)
  - Excoriation disorder (6B25.1)
  - Gender incongruence (HA60-HA6Z)
  - Sexual dysfunctions (HA00-HA0Z)
  - Tic disorders (8A05)
  - Sexual pain-penetration disorder (HA20)
  - Postviral fatigue syndrome (8E49)
  - Chronic fatigue syndrome (8E49)
  - Myalgic encephalomyelitis (8E49)

- 6C20.0      Mild bodily distress disorder**  
All definitional requirements of bodily distress disorder are present. There is excessive attention to distressing symptoms and their consequences, which may result in frequent medical visits, but the person is not preoccupied with the symptoms (e.g., the individual spends less than an hour per day focusing on them). Although the individual expresses distress about the symptoms and they may have some impact on his or her life (e.g., strain in relationships, less effective academic or occupational functioning, abandonment of specific leisure activities), there is no substantial impairment in the person's personal, family, social, educational, occupational, or other important areas of functioning.
- 6C20.1      Moderate bodily distress disorder**  
All definitional requirements of bodily distress disorder are present. There is persistent preoccupation with the distressing symptoms and their consequences (e.g., the individual spends more than an hour a day thinking about them), typically associated with frequent medical visits. The person devotes much of his or her energy to focusing on the symptoms and their consequences. The symptoms and associated distress and preoccupation cause moderate impairment in personal, family, social, educational, occupational, or other important areas of functioning (e.g., relationship conflict, performance problems at work, abandonment of a range of social and leisure activities).
- 6C20.2      Severe bodily distress disorder**  
All definitional requirements of Bodily distress disorder are present. There is pervasive and persistent preoccupation with the symptoms and their consequences to the extent that these may become the focal point of the person's life, typically resulting in extensive interactions with the health care system. The symptoms and associated distress and preoccupation cause serious impairment in personal, family, social, educational, occupational, or other important areas of functioning (e.g., unable to work, alienation of friends and family, abandonment of nearly all social and leisure activities). The person's interests may become so narrow as to focus almost exclusively on his or her bodily symptoms and their negative consequences.
- 6C20.Z      Bodily distress disorder, unspecified**
- 6C21      Body integrity dysphoria**  
Body integrity dysphoria is characterised by an intense and persistent desire to become physically disabled in a significant way (e.g. major limb amputee, paraplegic, blind), with onset by early adolescence accompanied by persistent discomfort, or intense feelings of inappropriateness concerning current non-disabled body configuration. The desire to become physically disabled results in harmful consequences, as manifested by either the preoccupation with the desire (including time spent pretending to be disabled) significantly interfering with productivity, with leisure activities, or with social functioning (e.g. person is unwilling to have a close relationship because it would make it difficult to pretend) or by attempts to actually become disabled having resulted in the person putting his or her health or life in significant jeopardy. The disturbance is not better accounted for by another mental, behavioural or neurodevelopmental disorder, by a Disease of the Nervous System or by another medical condition, or by Malingering.

**Exclusions:**      Gender incongruence of adolescence or adulthood (HA60)

**6C2Y****Other specified disorders of bodily distress or bodily experience****6C2Z****Disorders of bodily distress or bodily experience, unspecified**

## Disorders due to substance use or addictive behaviours (6C40-6C5Z)

Disorders due to substance use and addictive behaviours are mental and behavioural disorders that develop as a result of the use of predominantly psychoactive substances, including medications, or specific repetitive rewarding and reinforcing behaviours.

### Disorders due to substance use (6C40-6C4Z)

Disorders due to substance use include disorders that result from a single occasion or repeated use of substances that have psychoactive properties, including certain medications. Disorders related to fourteen classes or groups of psychoactive substances are included. Typically, initial use of these substances produces pleasant or appealing psychoactive effects that are rewarding and reinforcing with repeated use. With continued use, many of the included substances have the capacity to produce dependence. They also have the potential to cause numerous forms of harm, both to mental and physical health. Disorders due to harmful non-medical use of non-psychoactive substances are also included in this grouping.

**Coded Elsewhere:** Catatonia induced by substances or medications (6A41)

**6C40**

### Disorders due to use of alcohol

Disorders due to use of alcohol are characterised by the pattern and consequences of alcohol use. Alcohol—more specifically termed ethyl alcohol or ethanol—is an intoxicating compound produced by fermentation of sugars usually in agricultural products such as fruits, cereals, and vegetables with or without subsequent distillation. There are a wide variety of alcoholic drinks, with alcohol concentrations typically ranging from 1.5% to 60%. Alcohol is predominantly a central nervous system depressant. In addition to ability to produce Alcohol Intoxication, alcohol has dependence-producing properties, resulting in Alcohol Dependence in some people and Alcohol Withdrawal when alcohol use is reduced or discontinued. Unlike most other substances, elimination of alcohol from the body occurs at a constant rate, such that its clearance follows a linear rather than a logarithmic course. Alcohol is implicated in a wide range of harms affecting most organs and systems of the body (e.g., cirrhosis of the liver, gastrointestinal cancers, pancreatitis). Harm to others resulting from behaviour during Alcohol Intoxication is well recognized and is included in the definitions of harmful use of alcohol (i.e., Episode of Harmful Use of Alcohol and Harmful Pattern of Use of Alcohol). Several alcohol-induced mental disorders (e.g., Alcohol-Induced Psychotic Disorder) and alcohol-related forms of neurocognitive impairment (e.g., Dementia Due to Use of Alcohol) are recognized.

**Exclusions:** Hazardous alcohol use (QE10)

- 6C40.0      Episode of harmful use of alcohol**
- An episode of use of alcohol that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to alcohol intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of alcohol use.
- Exclusions:**      Harmful pattern of use of alcohol (6C40.1)  
Alcohol dependence (6C40.2)
- 6C40.1      Harmful pattern of use of alcohol**
- A pattern of alcohol use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of alcohol use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to alcohol intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of alcohol applies.
- Exclusions:**      Alcohol dependence (6C40.2)  
Episode of harmful use of alcohol (6C40.0)
- 6C40.10     Harmful pattern of use of alcohol, episodic**
- A pattern of episodic or intermittent alcohol use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic alcohol use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to alcohol intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of alcohol applies.
- Exclusions:**      Episode of harmful use of alcohol (6C40.0)  
Alcohol dependence (6C40.2)

<b>6C40.11</b>	Harmful pattern of use of alcohol, continuous  A pattern of continuous (daily or almost daily) alcohol use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous alcohol use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to alcohol intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of alcohol applies.
	<b><i>Exclusions:</i></b> Episode of harmful use of alcohol (6C40.0) Alcohol dependence (6C40.2)
<b>6C40.1Z</b>	Harmful pattern of use of alcohol, unspecified
<b>6C40.2</b>	<p><b>Alcohol dependence</b></p> <p>Alcohol dependence is a disorder of regulation of alcohol use arising from repeated or continuous use of alcohol. The characteristic feature is a strong internal drive to use alcohol, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use alcohol. Physiological features of dependence may also be present, including tolerance to the effects of alcohol, withdrawal symptoms following cessation or reduction in use of alcohol, or repeated use of alcohol or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if alcohol use is continuous (daily or almost daily) for at least 3 months.</p> <p><b><i>Inclusions:</i></b> Chronic alcoholism Dipsomania</p> <p><b><i>Exclusions:</i></b> Episode of harmful use of alcohol (6C40.0) Harmful pattern of use of alcohol (6C40.1)</p>
<b>6C40.20</b>	<p>Alcohol dependence, current use, continuous</p> <p>Alcohol dependence with continuous consumption of alcohol (daily or almost daily) over a period of at least 1 month.</p> <p><b><i>Exclusions:</i></b> Episode of harmful use of alcohol (6C40.0) Harmful pattern of use of alcohol (6C40.1)</p>
<b>6C40.21</b>	<p>Alcohol dependence, current use, episodic</p> <p>During the past 12 months, there has been alcohol dependence with intermittent heavy drinking, with periods of abstinence from alcohol. If current use is continuous (daily or almost daily over at least the past 1 month), the diagnosis of Alcohol dependence, current use, continuous should be made instead.</p> <p><b><i>Exclusions:</i></b> Episode of harmful use of alcohol (6C40.0) Harmful pattern of use of alcohol (6C40.1)</p>

- 6C40.22** Alcohol dependence, early full remission  
After a diagnosis of alcohol dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from alcohol during a period lasting between 1 and 12 months.
- Exclusions:** Episode of harmful use of alcohol (6C40.0)  
Harmful pattern of use of alcohol (6C40.1)
- 6C40.23** Alcohol dependence, sustained partial remission  
After a diagnosis of alcohol dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in alcohol consumption for more than 12 months, such that even though intermittent or continuing drinking has occurred during this period, the definitional requirements for dependence have not been met.
- Exclusions:** Episode of harmful use of alcohol (6C40.0)  
Harmful pattern of use of alcohol (6C40.1)
- 6C40.24** Alcohol dependence, sustained full remission  
After a diagnosis of alcohol dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from alcohol for 12 months or longer.
- Exclusions:** Episode of harmful use of alcohol (6C40.0)  
Harmful pattern of use of alcohol (6C40.1)
- 6C40.2Z** Alcohol dependence, unspecified
- 6C40.3** **Alcohol intoxication**  
Alcohol intoxication is a clinically significant transient condition that develops during or shortly after the consumption of alcohol that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of alcohol and their intensity is closely related to the amount of alcohol consumed. They are time-limited and abate as alcohol is cleared from the body. Presenting features may include impaired attention, inappropriate or aggressive behaviour, lability of mood and emotions, impaired judgment, poor coordination, unsteady gait, fine nystagmus and slurred speech. At more severe levels of intoxication, stupor or coma may occur. Alcohol intoxication may facilitate suicidal ideation or behaviour.

- Exclusions:** alcohol poisoning (NE61)  
Possession trance disorder (6B63)

<b>6C40.4</b>	<b>Alcohol withdrawal</b> Alcohol withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of alcohol in individuals who have developed Alcohol dependence or have used alcohol for a prolonged period or in large amounts. Presenting features of Alcohol withdrawal may include autonomic hyperactivity (e.g. tachycardia, hypertension, perspiration), increased hand tremor, nausea, retching or vomiting, insomnia, anxiety, psychomotor agitation, depressed or dysphoric mood, transient visual, tactile or auditory illusions or hallucinations, and distractability. Less commonly, the withdrawal state is complicated by generalised tonic-clonic seizures. The withdrawal state may progress to a very severe form of delirium characterised by confusion and disorientation, delusions, and prolonged visual, tactile or auditory hallucinations. In such cases, a separate diagnosis of Alcohol-induced delirium should also be assigned.
<b>Coding Note:</b>	Code also the causing condition
<b>6C40.40</b>	Alcohol withdrawal, uncomplicated All diagnostic requirements for Alcohol Withdrawal are met and the withdrawal state is not accompanied by perceptual disturbances or seizures.
<b>Coding Note:</b>	Code also the causing condition
<b>6C40.41</b>	Alcohol withdrawal with perceptual disturbances All diagnostic requirements for Alcohol withdrawal are met and the withdrawal state is accompanied by perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. There is no evidence of confusion and other diagnostic requirements for Delirium are not met. The withdrawal state is not accompanied by seizures.
<b>Coding Note:</b>	Code also the causing condition
<b>6C40.42</b>	Alcohol withdrawal with seizures All diagnostic requirements for Alcohol withdrawal are met and the withdrawal state is accompanied by seizures (i.e., generalised tonic-clonic seizures) but not by perceptual disturbances.
<b>Coding Note:</b>	Code also the causing condition
<b>6C40.43</b>	Alcohol withdrawal with perceptual disturbances and seizures All diagnostic requirements for Alcohol withdrawal are met and the withdrawal state is accompanied by both seizures (i.e., generalised tonic-clonic seizures) and perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. Diagnostic requirements for Delirium are not met.
<b>Coding Note:</b>	Code also the causing condition
<b>6C40.4Z</b>	Alcohol withdrawal, unspecified <b>Coding Note:</b> Code also the causing condition

<b>6C40.5</b>	<b>Alcohol-induced delirium</b> Alcohol-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of alcohol. The amount and duration of alcohol use must be capable of producing delirium. Specific features of alcohol-induced delirium may include impaired consciousness with disorientation, vivid hallucinations and illusions, insomnia, delusions, agitation, disturbances of attention, and accompanying tremor and physiological symptoms of alcohol withdrawal. In some cases of alcohol withdrawal, the withdrawal state may progress to a very severe form of Alcohol-induced delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.
<b>Coding Note:</b>	Code also the causing condition
	<b>Inclusions:</b> Delirium tremens (alcohol-induced) Delirium induced by alcohol withdrawal
<b>6C40.6</b>	<b>Alcohol-induced psychotic disorder</b> Alcohol-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from alcohol. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Alcohol intoxication or Alcohol withdrawal. The amount and duration of alcohol use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the alcohol use, if the symptoms persist for a substantial period of time after cessation of the alcohol use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with alcohol use).
<b>Coding Note:</b>	Code also the causing condition
<b>6C40.60</b>	Alcohol-induced psychotic disorder with hallucinations Alcohol-induced psychotic disorder with hallucinations is characterised by the presence of hallucinations that are judged to be the direct consequence of alcohol use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).
<b>Coding Note:</b>	Code also the causing condition

- 6C40.61** Alcohol-induced psychotic disorder with delusions  
Alcohol-induced psychotic disorder with delusions is characterised by the presence of delusions that are judged to be the direct consequence of alcohol use. Neither hallucinations nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).
- Coding Note:** Code also the causing condition
- 6C40.62** Alcohol-induced psychotic disorder with mixed psychotic symptoms  
Alcohol-induced psychotic disorder with mixed psychotic symptoms is characterised by the presence of multiple psychotic symptoms, primarily hallucinations and delusions, when these are judged to be the direct consequence of alcohol use. The symptoms do not occur exclusively during hypnogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

**6C40.Z** Disorders due to use of alcohol, unspecified

**6C41**

**Disorders due to use of cannabis**

Disorders due to use of cannabis are characterised by the pattern and consequences of cannabis use. Cannabis is the collective term for a range of psychoactive preparations of the cannabis plant, *Cannabis sativa*, and related species and hybrids. Cannabis contains cannabinoids, a class of diverse chemical compounds that act on endogenous cannabinoid receptors that modulate neurotransmitter release in the brain. The principal psychoactive cannabinoid is δ-9-tetrahydrocannabinol (THC). Cannabis is typically smoked in the form of the flowering heads or leaves of the marijuana plant; tobacco is often mixed with cannabis when smoked. There are also cannabis oils that are prepared from these same sources. These preparations vary considerably in their THC potency. Cannabis has predominantly central nervous system depressant effects and produces a characteristic euphoria that may be part of the presenting features of Cannabis Intoxication, which may also include impairment in cognitive and psychomotor functioning. Cannabis has dependence-producing properties resulting in Cannabis Dependence in some people and Cannabis Withdrawal when use is reduced or discontinued. Cannabis is associated with a range of Cannabis-Induced Mental Disorders.

**Exclusions:** Disorders due to use of synthetic cannabinoids (6C42)

Hazardous use of cannabis (QE11.1)

- 6C41.0      Episode of harmful use of cannabis**
- An episode of use of cannabis that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to cannabis intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of cannabis use.
- Exclusions:**      Cannabis dependence (6C41.2)  
                          Harmful pattern of use of cannabis (6C41.1)
- 6C41.1      Harmful pattern of use of cannabis**
- A pattern of cannabis use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of cannabis use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cannabis intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cannabis applies.
- Exclusions:**      Cannabis dependence (6C41.2)  
                          Episode of harmful use of cannabis (6C41.0)
- 6C41.10     Harmful pattern of use of cannabis, episodic**
- A pattern of episodic or intermittent cannabis use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic cannabis use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cannabis intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cannabis applies.
- Exclusions:**      Episode of harmful use of cannabis (6C41.0)  
                          Cannabis dependence (6C41.2)

- 6C41.11** Harmful pattern of use of cannabis, continuous  
A pattern of continuous (daily or almost daily) cannabis use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous cannabis use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cannabis intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cannabis applies.
- Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Cannabis dependence (6C41.2)
- 6C41.1Z** Harmful pattern of use of cannabis, unspecified
- 6C41.2** **Cannabis dependence**  
Cannabis dependence is a disorder of regulation of cannabis use arising from repeated or continuous use of cannabis. The characteristic feature is a strong internal drive to use cannabis, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use cannabis. Physiological features of dependence may also be present, including tolerance to the effects of cannabis, withdrawal symptoms following cessation or reduction in use of cannabis, or repeated use of cannabis or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if cannabis use is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Harmful pattern of use of cannabis (6C41.1)
- 6C41.20** Cannabis dependence, current use  
Current cannabis dependence with use of cannabis within the past month.
- Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Harmful pattern of use of cannabis (6C41.1)
- 6C41.21** Cannabis dependence, early full remission  
After a diagnosis of cannabis dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from cannabis during a period lasting between 1 and 12 months.
- Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Harmful pattern of use of cannabis (6C41.1)

<b>6C41.22</b>	Cannabis dependence, sustained partial remission  After a diagnosis of cannabis dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in cannabis consumption for more than 12 months, such that even though cannabis use has occurred during this period, the definitional requirements for dependence have not been met.
	<b><i>Exclusions:</i></b> Episode of harmful use of cannabis (6C41.0) Harmful pattern of use of cannabis (6C41.1)
<b>6C41.23</b>	Cannabis dependence, sustained full remission  After a diagnosis of cannabis dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from cannabis for 12 months or longer.
	<b><i>Exclusions:</i></b> Episode of harmful use of cannabis (6C41.0) Harmful pattern of use of cannabis (6C41.1)

<b>6C42.6</b>	<b>Synthetic cannabinoid-induced psychotic disorder</b> Synthetic cannabinoid-induced psychotic disorder is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from synthetic cannabinoids. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Synthetic cannabinoid intoxication or Synthetic cannabinoid withdrawal. The amount and duration of synthetic cannabinoid use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the synthetic cannabinoid use, if the symptoms persist for a substantial period of time after cessation of the synthetic cannabinoid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with synthetic cannabinoid use).
<b>Coding Note:</b>	Code also the causing condition
<b>6C42.7</b>	<b>Certain specified synthetic cannabinoids-induced mental or behavioural disorders</b>

<b>6C42.Y</b>	<b>Other specified disorders due to use of synthetic cannabinoids</b>
<b>6C42.Z</b>	<b>Disorders due to use of synthetic cannabinoids, unspecified</b>
<b>6C43</b>	<b>Disorders due to use of opioids</b> Disorders due to use of opioids are characterised by the pattern and consequences of opioid use. Opioids is a generic term that encompasses the constituents or derivatives of the opium poppy Papaver somniferum as well as a range of synthetic and semisynthetic compounds, some related to morphine and others chemically distinct but all having their primary actions on the $\mu$ opioid receptor. Examples of opioids include morphine, diacetylmorphine (heroin), fentanyl, pethidine, oxycodone, hydromorphone, methadone, buprenorphine, codeine and d-propoxyphene. The opioids all have analgesic properties of different potencies and are primarily central nervous system depressants. They suppress respiration as well as other vital functions and are a common cause of overdose and related deaths. Certain opioids are used or administered parenterally, including heroin, a common and potent opioid that is primarily used non-medically. Therapeutic opioids are prescribed for a range of indications worldwide, and are essential for pain management in cancer pain and palliative care, although they are also used for non-therapeutic reasons. In some countries morbidity and mortality related to therapeutic opioids is greater than that related to heroin. All opioids may result in Opioid Intoxication, Opioid Dependence and Opioid Withdrawal. A range of Opioid-Induced Disorders occur, some of which occur following Opioid Withdrawal.

**Exclusions:** Hazardous use of opioids (QE11.0)

**6C43.0**

**Episode of harmful use of opioids**

An episode of opioid use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to opioid intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of opioid use.

**Exclusions:**      Harmful pattern of use of opioids (6C43.1)  
                          Opioid dependence (6C43.2)

**6C43.1**

**Harmful pattern of use of opioids**

A pattern of use of opioids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of opioid use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to opioid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of opioids applies.

**Exclusions:**      Episode of harmful use of opioids (6C43.0)  
                          Opioid dependence (6C43.2)

**6C43.10**

**Harmful pattern of use of opioids, episodic**

A pattern of episodic or intermittent use of opioids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic opioid use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to opioid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of opioids applies.

**Exclusions:**      Episode of harmful use of opioids (6C43.0)  
                          Opioid dependence (6C43.2)

- 6C43.11** Harmful pattern of use of opioids, continuous  
A pattern of continuous (daily or almost daily) use of opioids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous opioid use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to opioid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of opioids applies.
- Exclusions:** Episode of harmful use of opioids (6C43.0)  
Opioid dependence (6C43.2)
- 6C43.1Z** Harmful pattern of use of opioids, unspecified
- 6C43.2** **Opioid dependence**  
Opioid dependence is a disorder of regulation of opioid use arising from repeated or continuous use of opioids. The characteristic feature is a strong internal drive to use opioids, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use opioids. Physiological features of dependence may also be present, including tolerance to the effects of opioids, withdrawal symptoms following cessation or reduction in use of opioids, or repeated use of opioids or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if opioid use is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of opioids (6C43.0)  
Harmful pattern of use of opioids (6C43.1)
- 6C43.20** Opioid dependence, current use  
Opioid dependence, with use of an opioid within the past month.  
**Exclusions:** Episode of harmful use of opioids (6C43.0)  
Harmful pattern of use of opioids (6C43.1)
- 6C43.21** Opioid dependence, early full remission  
After a diagnosis of opioid dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from opioid use during a period lasting between 1 and 12 months.  
**Exclusions:** Episode of harmful use of opioids (6C43.0)  
Harmful pattern of use of opioids (6C43.1)

<b>6C43.22</b>	Opioid dependence, sustained partial remission After a diagnosis of Opioid dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in opioid consumption for more than 12 months, such that even though opioid use has occurred during this period, the definitional requirements for dependence have not been met.
	<b>Exclusions:</b> Episode of harmful use of opioids (6C43.0) Harmful pattern of use of opioids (6C43.1)
<b>6C43.23</b>	Opioid dependence, sustained full remission After a diagnosis of Opioid dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from opioids for 12 months or longer.
	<b>Exclusions:</b> Episode of harmful use of opioids (6C43.0) Harmful pattern of use of opioids (6C43.1)
<b>6C43.2Z</b>	Opioid dependence, unspecified
<b>6C43.3</b>	<b>Opioid intoxication</b> Opioid intoxication is a clinically significant transient condition that develops during or shortly after the consumption of opioids that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of opioids and their intensity is closely related to the amount of opioids consumed. They are time-limited and abate as opioids are cleared from the body. Presenting features may include somnolence, stupor, mood changes (e.g. euphoria followed by apathy and dysphoria), psychomotor retardation, impaired judgment, respiratory depression, slurred speech, and impairment of memory and attention. In severe intoxication coma may ensue. A characteristic physical sign is pupillary constriction but this sign may be absent when intoxication is due to synthetic opioids. Severe opioid intoxication can lead to death due to respiratory depression.
	<b>Coding Note:</b> Code also the causing condition
	<b>Exclusions:</b> opioid poisoning (NE60) Possession trance disorder (6B63) fentanyl poisoning (NE60) oxycodone poisoning (NE60)

<b>6C43.4</b>	<b>Opioid withdrawal</b> Opioid withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of opioids in individuals who have developed Opioid dependence or have used opioids for a prolonged period or in large amounts. Opioid withdrawal can also occur when prescribed opioids have been used in standard therapeutic doses. Presenting features of Opioid withdrawal may include dysphoric mood, craving for an opioid, anxiety, nausea or vomiting, abdominal cramps, muscle aches, yawning, perspiration, hot and cold flushes, lacrimation, rhinorrhea, hypersomnia (typically in the initial phase) or insomnia, diarrhea, piloerection, and pupillary dilatation.
<b>Coding Note:</b>	Code also the causing condition
<b>6C43.5</b>	<b>Opioid-induced delirium</b> Opioid-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of opioids. The amount and duration of opioid use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, Behavioural, and Neurodevelopmental Disorders.
<b>Coding Note:</b>	Code also the causing condition
	<b>Inclusions:</b> Delirium induced by opioid withdrawal
<b>6C43.6</b>	<b>Opioid-induced psychotic disorder</b> Opioid-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from opioids. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Opioid intoxication or Opioid withdrawal. The amount and duration of opioid use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the opioid use, if the symptoms persist for a substantial period of time after cessation of the opioid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with opioid use).

<b>6C43.Y</b>	<b>Other specified disorders due to use of opioids</b>
<b>6C43.Z</b>	<b>Disorders due to use of opioids, unspecified</b>
<b>6C44</b>	<b>Disorders due to use of sedatives, hypnotics or anxiolytics</b> Disorders due to use of sedatives, hypnotics or anxiolytics are characterised by the pattern and consequences of use of these substances. Sedatives, hypnotics, and anxiolytics are typically prescribed for the short-term treatment of anxiety or insomnia and are also employed to provide sedation for medical procedures. They include the benzodiazepines and the non-benzodiazepine positive allosteric modulators of GABA receptors (i.e., 'Z-drugs') as well as many other compounds. Sedatives, hypnotics, and anxiolytics include barbiturates, which are available much less commonly now than in previous decades. Sedatives, hypnotics, and anxiolytics have dependence-inducing properties that are related to the dose and duration of their use. They may cause intoxication, dependence and withdrawal. Several other mental disorders induced by sedatives, hypnotics, or anxiolytics are recognized. <b>Exclusions:</b> Hazardous use of sedatives, hypnotics or anxiolytics (QE11.2)

- 6C44.0      Episode of harmful use of sedatives, hypnotics or anxiolytics**
- An episode of use of a sedative, hypnotic or anxiolytic that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to sedative, hypnotic or anxiolytic intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of sedative, hypnotic or anxiolytic use.
- Exclusions:**
- Sedative, hypnotic or anxiolytic dependence (6C44.2)
- Harmful pattern of use of sedatives, hypnotics or anxiolytics  
(6C44.1)
- 6C44.1      Harmful pattern of use of sedatives, hypnotics or anxiolytics**
- A pattern of sedative, hypnotic, or anxiolytic use that has caused clinically significant harm to a person's physical or mental health or in which behaviour induced by sedatives, hypnotics or anxiolytics has caused clinically significant harm to the health of other people. The pattern of sedative, hypnotic, or anxiolytic use is evident over a period of at least 12 months if use is episodic and at least one month if use is continuous (i.e., daily or almost daily). Harm may be caused by the intoxicating effects of sedatives, hypnotics or anxiolytics, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.
- Exclusions:**
- Sedative, hypnotic or anxiolytic dependence (6C44.2)
- Episode of harmful use of sedatives, hypnotics or anxiolytics  
(6C44.0)
- 6C44.10      Harmful pattern of use of sedatives, hypnotics or anxiolytics, episodic**
- A pattern of episodic or intermittent use of sedatives, hypnotics or anxiolytics that has caused clinically significant harm to a person's physical or mental health or in which behaviour induced by sedatives, hypnotics or anxiolytics has caused clinically significant harm to the health of other people. The pattern of episodic or intermittent use of sedatives, hypnotics or anxiolytics is evident over a period of at least 12 months. Harm may be caused by the intoxicating effects of sedatives, hypnotics or anxiolytics, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.
- Exclusions:**
- Episode of harmful use of sedatives, hypnotics or anxiolytics  
(6C44.0)
- Sedative, hypnotic or anxiolytic dependence (6C44.2)

- 6C44.11** Harmful pattern of use of sedatives, hypnotics or anxiolytics, continuous  
A pattern of continuous use of sedatives, hypnotics or anxiolytics (daily or almost daily) that has caused clinically significant harm to a person's physical or mental health or in which behaviour induced by sedatives, hypnotics or anxiolytics has caused clinically significant harm to the health of other people. The pattern of continuous use of sedatives, hypnotics or anxiolytics is evident over a period of at least one month. Harm may be caused by the intoxicating effects of sedatives, hypnotics or anxiolytics, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.
- Exclusions:** Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)  
Sedative, hypnotic or anxiolytic dependence (6C44.2)
- 6C44.1Z** Harmful pattern of use of sedatives, hypnotics or anxiolytics, unspecified
- 6C44.2** **Sedative, hypnotic or anxiolytic dependence**  
Sedative, hypnotic or anxiolytic dependence is a disorder of regulation of sedative use arising from repeated or continuous use of these substances. The characteristic feature is a strong internal drive to use sedatives, hypnotics, or anxiolytics, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use these substances. <b>Coding Note:</b>	Code also the causing condition

<b>6C44.71</b>	Sedative, hypnotic or anxiolytic-induced anxiety disorder Sedative, hypnotic or anxiolytic-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from sedatives, hypnotics or anxiolytics. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of intoxication or withdrawal due to sedatives, hypnotics or anxiolytics. The amount and duration of sedative, hypnotic or anxiolytic use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the sedative, hypnotic or anxiolytic use, if the symptoms persist for a substantial period of time after cessation of the sedative, hypnotic or anxiolytic use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with sedative, hypnotic or anxiolytic use).

## **6C45**

### **Disorders due to use of cocaine**

Disorders due to use of cocaine are characterised by the pattern and consequences of cocaine use. Cocaine is a compound found in the leaves of the coca plant, *Erythroxylum coca*, which is indigenous to countries in northern regions of South America. Cocaine has a limited place in medical treatment as an anaesthetic and vasoconstrictive agent. It is commonly used illicitly and widely available across the world, where it is found in two main forms: cocaine hydrochloride and cocaine freebase (also known as 'crack'). Cocaine is a central nervous system stimulant, and Cocaine Intoxication typically includes a state of euphoria and hyperactivity. Cocaine has potent dependence-producing properties and Cocaine Dependence is a common cause of morbidity and of clinical presentations. Cocaine Withdrawal has a characteristic course that includes lethargy and depressed mood. A range of Cocaine-Induced Mental Disorders is described.

**Exclusions:** Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone (6C46)

Hazardous use of cocaine (QE11.3)

- 6C45.0      Episode of harmful use of cocaine**
- An episode of use of cocaine that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to cocaine intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of cocaine use.
- Exclusions:**      Cocaine dependence (6C45.2)  
                          Harmful pattern of use of cocaine (6C45.1)
- 6C45.1      Harmful pattern of use of cocaine**
- A pattern of use of cocaine that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of cocaine use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cocaine intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cocaine applies.
- Exclusions:**      Cocaine dependence (6C45.2)  
                          Episode of harmful use of cocaine (6C45.0)
- 6C45.10     Harmful pattern of use of cocaine, episodic**
- A pattern of episodic or intermittent cocaine use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic cocaine use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cocaine intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cocaine applies.
- Exclusions:**      Episode of harmful use of cocaine (6C45.0)  
                          Cocaine dependence (6C45.2)

- 6C45.11** Harmful pattern of use of cocaine, continuous  
A pattern of continuous (daily or almost daily) cocaine use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous cocaine use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cocaine intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cocaine applies.
- Exclusions:** Episode of harmful use of cocaine (6C45.0)  
Cocaine dependence (6C45.2)
- 6C45.1Z** Harmful pattern of use of cocaine, unspecified
- 6C45.2** **Cocaine dependence**  
Cocaine dependence is a disorder of regulation of cocaine use arising from repeated or continuous use of cocaine. The characteristic feature is a strong internal drive to use cocaine, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use cocaine. Physiological features of dependence may also be present, including tolerance to the effects of cocaine, withdrawal symptoms following cessation or reduction in use of cocaine, or repeated use of cocaine or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if cocaine use is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of cocaine (6C45.0)  
Harmful pattern of use of cocaine (6C45.1)
- 6C45.20** Cocaine dependence, current use  
Current cocaine dependence with cocaine use within the past month.
- Exclusions:** Episode of harmful use of cocaine (6C45.0)  
Harmful pattern of use of cocaine (6C45.1)
- 6C45.21** Cocaine dependence, early full remission  
After a diagnosis of Cocaine dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from cocaine during a period lasting between 1 and 12 months.
- Exclusions:** Episode of harmful use of cocaine (6C45.0)  
Harmful pattern of use of cocaine (6C45.1)

<b>6C45.22</b>	Cocaine dependence, sustained partial remission  After a diagnosis of Cocaine dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in cocaine consumption for more than 12 months, such that even though cocaine use has occurred during this period, the definitional requirements for dependence have not been met.
	<b>Exclusions:</b> Episode of harmful use of cocaine (6C45.0) Harmful pattern of use of cocaine (6C45.1)
<b>6C45.23</b>	Cocaine dependence, sustained full remission  After a diagnosis of cocaine dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from cocaine for 12 months or longer.
	<b>Exclusions:</b> Episode of harmful use of cocaine (6C45.0) Harmful pattern of use of cocaine (6C45.1)
<b>6C45.2Z</b>	Cocaine dependence, unspecified
<b>6C45.3</b>	<b>Cocaine intoxication</b>  Cocaine intoxication is a clinically significant transient condition that develops during or shortly after the consumption of cocaine that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of cocaine and their intensity is closely related to the amount of cocaine consumed. They are time-limited and abate as cocaine is cleared from the body. Presenting features may include inappropriate euphoria, anxiety, anger, impaired attention, hypervigilance, psychomotor agitation, paranoid ideation (sometimes of delusional intensity), auditory hallucinations, confusion, and changes in sociability. Perspiration or chills, nausea or vomiting, and palpitations and chest pain may be experienced. Physical signs may include tachycardia, elevated blood pressure, and pupillary dilatation. In rare instances, usually in severe intoxication, cocaine use can result in seizures, muscle weakness, dyskinesia, or dystonia.
	<b>Coding Note:</b> Code also the causing condition
	<b>Exclusions:</b> cocaine poisoning (NE60) Possession trance disorder (6B63)
<b>6C45.4</b>	<b>Cocaine withdrawal</b>  Cocaine withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of cocaine in individuals who have developed Cocaine dependence or have used cocaine for a prolonged period or in large amounts. Presenting features of Cocaine withdrawal may include dysphoric mood, irritability, fatigue, psychomotor retardation, vivid unpleasant dreams, insomnia or hypersomnia, increased appetite, anxiety, psychomotor agitation or retardation, and craving for cocaine.
	<b>Coding Note:</b> Code also the causing condition

- 6C45.5 Cocaine-induced delirium**  
Cocaine-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of cocaine. The amount and duration of cocaine use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural, and neurodevelopmental disorders.
- Coding Note:** Code also the causing condition
- 6C45.6 Cocaine-induced psychotic disorder**  
Cocaine-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with cocaine use).
- Coding Note:** Code also the causing condition
- 6C45.60 Cocaine-induced psychotic disorder with hallucinations**  
Cocaine-induced psychotic disorder with hallucinations is characterised by the presence of hallucinations that are judged to be the direct consequence of cocaine use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).
- Coding Note:** Code also the causing condition
- 6C45.61 Cocaine-induced psychotic disorder with delusions**  
Cocaine-induced psychotic disorder with delusions is characterised by the presence of delusions that are judged to be the direct consequence of cocaine use. Neither hallucinations nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).
- Coding Note:** Code also the causing condition

<b>6C45.62</b>	Cocaine-induced psychotic disorder with mixed psychotic symptoms Cocaine-induced psychotic disorder with mixed psychotic symptoms is characterised by the presence of multiple psychotic symptoms, primarily hallucinations and delusions, when these are judged to be the direct consequence of cocaine use. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., Schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).
<b>Coding Note:</b>	Code also the causing condition
<b>6C45.6Z</b>	Cocaine-induced psychotic disorder, unspecified
<b>Coding Note:</b>	Code also the causing condition
<b>6C45.7</b>	<b>Certain specified cocaine-induced mental or behavioural disorders</b>
<b>Coding Note:</b>	Code also the causing condition
<b>6C45.70</b>	Cocaine-induced mood disorder Cocaine-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with cocaine use).
<b>Coding Note:</b>	Code also the causing condition
<b>6C45.71</b>	Cocaine-induced anxiety disorder Cocaine-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with cocaine use).
<b>Coding Note:</b>	Code also the causing condition

<b>6C45.72</b>	Cocaine-induced obsessive-compulsive or related disorder Cocaine-induced obsessive-compulsive or related disorder is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with cocaine use).
<b><i>Coding Note:</i></b>	Code also the causing condition
<b>6C45.73</b>	Cocaine-induced impulse control disorder Cocaine-induced impulse control disorder is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with cocaine use).

**6C46**

**Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone**

Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone are characterised by the pattern and consequences of use of these substances. There is a wide array of naturally occurring and synthetically produced psychostimulants other than cocaine. The most numerous of this group are the amphetamine-type substances, including methamphetamine. Prescribed stimulants including dexamphetamine are indicated for a limited number of conditions such as for Attention Deficit Hyperactivity Disorder. Methcathinone, known in many countries as ephedrone, is a synthetic potent stimulant that is a structural analogue of methamphetamine and is related to cathinone. All these drugs have primarily psychostimulant properties and are also vasoconstrictors to a varying degree. They induce euphoria and hyperactivity as may be seen in Stimulant Intoxication. They have potent dependence-producing properties, which may lead to the diagnosis of Stimulant Dependence and Stimulant Withdrawal following the cessation of use. Several Stimulant-Induced Mental Disorders are described.

- Exclusions:**
- Disorders due to use of synthetic cathinones (6C47)
  - Disorders due to use of caffeine (6C48)
  - Disorders due to use of cocaine (6C45)
  - Hazardous use of stimulants including amphetamines or methamphetamine (QE11.4)

**6C46.0**

**Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone**

An episode of use of a stimulant including amphetamines, methamphetamine and methcathinone that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to stimulant intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of stimulant including amphetamines, methamphetamine and methcathinone use.

- Exclusions:**
- Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)
  - Stimulant dependence including amphetamines, methamphetamine or methcathinone (6C46.2)

**6C46.1**

**Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone**

A pattern of use of stimulants including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of stimulant use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to stimulant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of stimulants including amphetamines, methamphetamine and methcathinone applies.

***Exclusions:***

**6C46.3 Stimulant intoxication including amphetamines, methamphetamine or methcathinone**

Stimulant intoxication including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones is a clinically significant transient condition that develops during or shortly after the consumption of amphetamine or other stimulants that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of amphetamine or other stimulants and their intensity is closely related to the amount of amphetamine or other stimulant consumed. They are time-limited and abate as amphetamine or another stimulant is cleared from the body. Presenting features may include anxiety, anger, impaired attention, hypervigilance, psychomotor agitation, paranoid ideation (possibly of delusional intensity), transient auditory hallucinations, transitory confusion, and changes in sociability. Perspiration or chills, nausea or vomiting, and palpitations may be experienced. Physical signs may include tachycardia, elevated blood pressure, pupillary dilatation, dyskinesias and dystonias, and skin sores. In rare instances, usually in severe intoxication, use of stimulants including amphetamines, methamphetamine and methcathinone can result in seizures.

## **6C47**

### **Disorders due to use of synthetic cathinones**

Disorders due to use of synthetic cathinones are characterised by the pattern and consequences of synthetic cathinone use. Synthetic cathinones (also known as 'bath salts') are synthetic compounds with stimulant properties related to cathinone found in the khat plant, Catha edulis. The use of synthetic cathinones is common in young populations in many countries. They may produce a range of disorders including Synthetic Cathinone Intoxication, Synthetic Cathinone Dependence and Synthetic Cathinone Withdrawal. Several synthetic cathinone-induced mental disorders are recognised.

**6C47.0** **Episode of harmful use of synthetic cathinones**

An episode of synthetic cathinone use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to synthetic cathinone intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of synthetic cathinone use.

**Exclusions:** Harmful pattern of use of synthetic cathinones (6C47.1)  
Synthetic cathinone dependence (6C47.2)

- 6C47.1** **Harmful pattern of use of synthetic cathinones**  
A pattern of use of synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of synthetic cathinone use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to synthetic cathinone intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of synthetic cathinones applies.
- Exclusions:** Episode of harmful use of synthetic cathinones (6C47.0)  
Synthetic cathinone dependence (6C47.2)
- 6C47.10** Harmful pattern of use of synthetic cathinones, episodic  
A pattern of episodic or intermittent use of synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic synthetic cathinone use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to synthetic cathinone intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of synthetic cathinones applies.
- Exclusions:** Episode of harmful use of synthetic cathinones (6C47.0)  
Synthetic cathinone dependence (6C47.2)
- 6C47.11** Harmful use of synthetic cathinones, continuous  
A pattern of continuous (daily or almost daily) use of synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous synthetic cathinone use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to synthetic cathinone intoxication on the part of the person to whom the diagnosis of Harmful use of synthetic cathinones applies.
- Exclusions:** Episode of harmful use of synthetic cathinones (6C47.0)  
Synthetic cathinone dependence (6C47.2)
- 6C47.1Y** Other specified harmful pattern of use of synthetic cathinones
- 6C47.1Z** Harmful pattern of use of synthetic cathinones, unspecified

<b>6C47.2</b>	<b>Synthetic cathinone dependence</b> Synthetic cathinone dependence is a disorder of regulation of synthetic cathinone use arising from repeated or continuous use of synthetic cathinones. The characteristic feature is a strong internal drive to use synthetic cathinones, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use synthetic cathinones. Physiological features of dependence may also be present, including tolerance to the effects of synthetic cathinones, withdrawal symptoms following cessation or reduction in use of synthetic cathinones, or repeated use of synthetic cathinones or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if synthetic cathinone use is continuous (daily or almost daily) for at least 3 months.
	<b>Exclusions:</b> Harmful pattern of use of synthetic cathinones (6C47.1) Episode of harmful use of synthetic cathinones (6C47.0)
<b>6C47.20</b>	Synthetic cathinone dependence, current use Current synthetic cathinone dependence with use of synthetic cathinones within the past month.
	<b>Exclusions:</b> Episode of harmful use of synthetic cathinones (6C47.0) Harmful pattern of use of synthetic cathinones (6C47.1)
<b>6C47.21</b>	Synthetic cathinone dependence, early full remission After a diagnosis of synthetic cathinone dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from synthetic cathinone use during a period lasting between 1 and 12 months.
	<b>Exclusions:</b> Episode of harmful use of synthetic cathinones (6C47.0) Harmful pattern of use of synthetic cathinones (6C47.1)
<b>6C47.22</b>	Synthetic cathinone dependence, sustained partial remission After a diagnosis of synthetic cathinone dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in synthetic cathinone consumption for more than 12 months, such that even though synthetic cathinone use has occurred during this period, the definitional requirements for dependence have not been met.
	<b>Exclusions:</b> Episode of harmful use of synthetic cathinones (6C47.0) Harmful pattern of use of synthetic cathinones (6C47.1)
<b>6C47.23</b>	Synthetic cathinone dependence, sustained full remission After a diagnosis of synthetic cathinone dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from synthetic cathinone use for 12 months or longer.
	<b>Exclusions:</b> Episode of harmful use of synthetic cathinones (6C47.0) Harmful pattern of use of synthetic cathinones (6C47.1)
<b>6C47.2Y</b>	Other specified synthetic cathinone dependence

- 6C47.2Z** Synthetic cathinone dependence, unspecified
- 6C47.3** **Synthetic cathinone intoxication**  
Synthetic cathinone intoxication is a clinically significant transient condition that develops during or shortly after the consumption of synthetic cathinones that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of synthetic cathinones and their intensity is closely related to the amount of synthetic cathinones consumed. They are time-limited and abate as the synthetic cathinone is cleared from the body. Presenting features may include anxiety, anger, impaired attention, hypervigilance, psychomotor agitation, paranoid ideation (possibly of delusional intensity), transient auditory hallucinations, transitory confusion, and changes in sociability. Perspiration or chills, nausea or vomiting, and palpitations may be experienced. Physical signs may include tachycardia, elevated blood pressure, pupillary dilatation, dyskinesias and dystonias, and skin sores. In rare instances, usually in severe intoxication, use of synthetic cathinones can result in seizures.
- Coding Note:** Code also the causing condition
- 6C47.4** **Synthetic cathinone withdrawal**  
Synthetic cathinone withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of synthetic cathinones in individuals who have developed Synthetic cathinone dependence or have used synthetic cathinones for a prolonged period or in large amounts. Presenting features of Synthetic cathinone withdrawal may include dysphoric mood, irritability, fatigue, insomnia or (more commonly) hypersomnia, vivid and unpleasant dreams, increased appetite, psychomotor agitation or retardation, and craving for stimulants, including synthetic cathinones.
- Coding Note:** Code also the causing condition
- 6C47.5** **Synthetic cathinone-induced delirium**  
Synthetic cathinone-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of synthetic cathinones. The amount and duration of synthetic cathinone use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.
- Coding Note:** Code also the causing condition

<b>6C47.6</b>	<b>Synthetic cathinone-induced psychotic disorder</b> Synthetic cathinone-induced psychotic disorder is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).
<b>Coding Note:</b>	Code also the causing condition
<b>6C47.60</b>	Synthetic cathinone-induced psychotic disorder with hallucinations Synthetic cathinone-induced psychotic disorder with hallucinations is characterised by the presence of hallucinations that are judged to be the direct consequence of synthetic cathinone use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).
<b>Coding Note:</b>	Code also the causing condition
<b>6C47.61</b>	Synthetic cathinone-induced psychotic disorder with delusions Synthetic cathinone psychotic disorder with delusions is characterised by the presence of delusions that are judged to be the direct consequence of synthetic cathinone use. Neither hallucinations nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).
<b>Coding Note:</b>	Code also the causing condition
<b>6C47.62</b>	Synthetic cathinone-induced psychotic disorder with mixed psychotic symptoms Synthetic cathinone-induced psychotic disorder with mixed psychotic symptoms is characterised by the presence of multiple psychotic symptoms, primarily hallucinations and delusions, when these are judged to be the direct consequence of synthetic cathinone use. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., Schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

## **Disorders due to use of caffeine**

Disorders due to use of caffeine are characterised by the pattern and consequences of caffeine use. Caffeine is a mild psychostimulant and diuretic that is found in the beans of the coffee plant (*Coffea* species) and is a constituent of coffee, cola drinks, chocolate, a range of proprietary 'energy drinks' and weight-loss aids. It is the most commonly used psychoactive substance worldwide and several clinical conditions related to its use are described, although severe disorders are comparatively rare considering its ubiquity. Caffeine Intoxication related to consumption of relatively higher doses (i.e., > 1 g per day) is described. Caffeine Withdrawal is common upon cessation of use among individuals who have used caffeine for a prolonged period or in large amounts. Caffeine-Induced Anxiety Disorder has been described, often following intoxication or heavy use.

**Exclusions:** Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone (6C46)  
Hazardous use of caffeine (QE11.5)

**6C48.0**

### **Episode of harmful use of caffeine**

An episode of caffeine use that has caused damage to a person's physical or mental health. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration. This diagnosis should not be made if the harm is attributed to a known pattern of caffeine use.

**Exclusions:** Harmful pattern of use of caffeine (6C48.1)

**6C48.1**

### **Harmful pattern of use of caffeine**

A pattern of caffeine use that has caused clinically significant harm to a person's physical or mental health or in which caffeine-induced behaviour has caused clinically significant harm to the health of other people. The pattern of caffeine use is evident over a period of at least 12 months if use is episodic and at least one month if use is continuous (i.e., daily or almost daily). Harm may be caused by the intoxicating effects of caffeine, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.

**Exclusions:** Episode of harmful use of caffeine (6C48.0)

**6C48.10**

### **Harmful pattern of use of caffeine, episodic**

A pattern of episodic or intermittent caffeine use that has caused damage to a person's physical or mental health. The pattern of episodic caffeine use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.

**Exclusions:** Episode of harmful use of caffeine (6C48.0)

**6C48.11**

### **Harmful pattern of use of caffeine, continuous**

A pattern of continuous (daily or almost daily) caffeine use that has caused damage to a person's physical or mental health. The pattern of continuous caffeine use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.

**Exclusions:** Episode of harmful use of caffeine (6C48.0)

<b>6C48.1Z</b>	Harmful pattern of use of caffeine, unspecified
<b>6C48.2</b>	<p><b>Caffeine intoxication</b></p> <p>Caffeine intoxication is a clinically significant transient condition that develops during or shortly after the consumption of caffeine that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of caffeine and their intensity is closely related to the amount of caffeine consumed. They are time-limited and abate as caffeine is cleared from the body. Presenting features may include restlessness, anxiety, excitement, insomnia, flushed face, tachycardia, diuresis, gastrointestinal disturbances, muscle twitching, psychomotor agitation, perspiration or chills, and nausea or vomiting. Cardiac arrhythmias may occur. Disturbances typical of intoxication tend to occur at relatively higher doses (e.g., &gt; 1 g per day). Very high doses of caffeine (e.g., &gt; 5 g) can result in respiratory distress or seizures and can be fatal.</p>
<b>Coding Note:</b>	Code also the causing condition
<b>6C48.3</b>	<p><b>Caffeine withdrawal</b></p> <p>Caffeine withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of caffeine (typically in the form of coffee, caffeinated drinks, or as an ingredient in certain over-the-counter medications) in individuals who have used caffeine for a prolonged period or in large amounts. Presenting features of Caffeine withdrawal may include headache, marked fatigue or drowsiness, irritability, depressed or dysphoric mood, nausea or vomiting, and difficulty concentrating.</p>

### **Disorders due to use of hallucinogens**

Disorders due to use of hallucinogens are characterised by the pattern and consequences of hallucinogen use. Several thousand compounds have hallucinogenic properties, many of which are found in plants (e.g., mescaline) and fungi (e.g., psilocybin) or are chemically synthesized (e.g., lysergic acid diethylamide [LSD]). These compounds have primarily hallucinogenic properties, but some may also be stimulants. Much of the morbidity associated with these compounds arises from the acute effects related to Hallucinogen Intoxication. Hallucinogen Dependence is rare and Hallucinogen Withdrawal is not described. Among the mental disorders related to hallucinogen use, Hallucinogen-Induced Psychotic Disorder is the most frequently seen, although worldwide it is still fairly uncommon.

**6C49.0**

### **Episode of harmful use of hallucinogens**

An episode of hallucinogen use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to hallucinogen intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of hallucinogen use.

**Exclusions:**      Hallucinogen dependence (6C49.2)

                          Harmful pattern of use of hallucinogens (6C49.1)

**6C49.1**

### **Harmful pattern of use of hallucinogens**

A pattern of use of hallucinogens that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of hallucinogen use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to hallucinogen intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of hallucinogens applies.

**Exclusions:**      Hallucinogen dependence (6C49.2)

                          Episode of harmful use of hallucinogens (6C49.0)

- 6C49.10** Harmful pattern of use of hallucinogens, episodic  
A pattern of episodic or intermittent use of hallucinogens that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic hallucinogen use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to hallucinogen intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of hallucinogens applies.
- Exclusions:** Episode of harmful use of hallucinogens (6C49.0)  
Hallucinogen dependence (6C49.2)
- 6C49.11** Harmful pattern of use of hallucinogens, continuous  
A pattern of continuous (daily or almost daily) use of hallucinogens that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous hallucinogen use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to hallucinogen intoxication on the part of the person to whom the diagnosis of Harmful use of hallucinogens applies.
- Exclusions:** Episode of harmful use of hallucinogens (6C49.0)  
Hallucinogen dependence (6C49.2)
- 6C49.1Z** Harmful pattern of use of hallucinogens, unspecified
- 6C49.2** **Hallucinogen dependence**  
Hallucinogen dependence is a disorder of regulation of hallucinogen use arising from repeated or continuous use of hallucinogens. The characteristic feature is a strong internal drive to use hallucinogens, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use hallucinogens. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if hallucinogens use is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of hallucinogens (6C49.0)  
Harmful pattern of use of hallucinogens (6C49.1)
- 6C49.20** Hallucinogen dependence, current use  
Current hallucinogen dependence with hallucinogen use within the past month.
- Exclusions:** Episode of harmful use of hallucinogens (6C49.0)  
Harmful pattern of use of hallucinogens (6C49.1)

<b>6C49.21</b>	Hallucinogen dependence, early full remission  After a diagnosis of Hallucinogen dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from hallucinogens during a period lasting between 1 and 12 months.
	<b>Exclusions:</b> Episode of harmful use of hallucinogens (6C49.0) Harmful pattern of use of hallucinogens (6C49.1)
<b>6C49.22</b>	Hallucinogen dependence, sustained partial remission  After a diagnosis of Hallucinogen dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in hallucinogen consumption for more than 12 months, such that even though intermittent or continuing hallucinogen use has occurred during this period, the definitional requirements for dependence have not been met.
	<b>Exclusions:</b> Episode of harmful use of hallucinogens (6C49.0) Harmful pattern of use of hallucinogens (6C49.1)
<b>6C49.23</b>	Hallucinogen dependence, sustained full remission  After a diagnosis of Hallucinogen dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from hallucinogens for 12 months or longer.
	<b>Exclusions:</b> Episode of harmful use of hallucinogens (6C49.0) Harmful pattern of use of hallucinogens (6C49.1)
<b>6C49.2Z</b>	Hallucinogen dependence, unspecified
<b>6C49.3</b>	<b>Hallucinogen intoxication</b>  Hallucinogen intoxication is a clinically significant transient condition that develops during or shortly after the consumption of hallucinogens that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of hallucinogens and their intensity is closely related to the amount of hallucinogen consumed. They are time-limited and abate as the hallucinogen is cleared from the body. Presenting features may include hallucinations, illusions, perceptual changes such as depersonalisation, derealization, or synesthesias (blending of senses, such as a visual stimulus evoking a smell), anxiety, depressed or dysphoric mood, ideas of reference, paranoid ideation, impaired judgment, palpitations, sweating, blurred vision, tremors and incoordination. Physical signs may include tachycardia, elevated blood pressure, and pupillary dilatation. In rare instances, hallucinogen intoxication may facilitate suicidal ideation and behaviour.
<b>Coding Note:</b>	Code also the causing condition
	<b>Exclusions:</b> hallucinogens poisoning (NE60) Possession trance disorder (6B63)

<b>6C49.4</b>	<b>Hallucinogen-induced delirium</b> Hallucinogen-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or during the use of hallucinogens. The amount and duration of hallucinogen use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.
<b>Coding Note:</b>	Code also the causing condition
<b>6C49.5</b>	<b>Hallucinogen-induced psychotic disorder</b> Hallucinogen-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganized behaviour) that develop during or soon after intoxication with hallucinogens. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of hallucinogen intoxication. The amount and duration of hallucinogen use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the hallucinogen use, if the symptoms persist for a substantial period of time after cessation of the hallucinogen use, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with hallucinogen use).
<b>Coding Note:</b>	Code also the causing condition
	<b>Exclusions:</b> Psychotic disorder induced by other specified psychoactive substance (6C4E.6) Alcohol-induced psychotic disorder (6C40.6)
<b>6C49.6</b>	<b>Certain specified hallucinogen-induced mental or behavioural disorders</b>
<b>Coding Note:</b>	Code also the causing condition
<b>6C49.60</b>	Hallucinogen-induced mood disorder Hallucinogen-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with hallucinogens. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of hallucinogen intoxication. The amount and duration of hallucinogen use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the hallucinogen use, if the symptoms persist for a substantial period of time after cessation of the hallucinogen use, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with hallucinogen use).
<b>Coding Note:</b>	Code also the causing condition

<b>6C49.61</b>	Hallucinogen-induced anxiety disorder Hallucinogen-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with hallucinogens. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of hallucinogen intoxication. The amount and duration of hallucinogen use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the hallucinogen use, if the symptoms persist for a substantial period of time after cessation of the hallucinogen use, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with hallucinogen use).

<b>6C4C</b>	<p><b>Disorders due to use of MDMA or related drugs, including MDA</b></p> <p>Disorders due to use of MDMA or related drugs, including MDA are characterised by the pattern and consequences of MDMA or related drug use. MDMA is methylene-dioxymethamphetamine and is a common drug of abuse in many countries especially among young people. It is predominantly available in tablet form known as 'ecstasy'. Pharmacologically, MDMA has stimulant and empathogenic properties and these encourage its use among young people for social and other interactions. Considering its wide prevalence in many countries and among many sub-groups of young people, MDMA and Related Drug Dependence and MDMA and Related Drug Withdrawal are comparatively uncommon. Substance-Induced Mental Disorders may arise from its use. Several analogues of MDMA exist, including MDA (methylene-dioxyamphetamine).</p> <p><b>Exclusions:</b> Hazardous use of MDMA or related drugs (QE11.6)</p> <p><b>6C4C.0</b> <b>Episode of harmful use of MDMA or related drugs, including MDA</b></p> <p>An episode of use of MDMA or related drugs, including MDA, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to intoxication with MDMA or related drugs, including MDA, on the part of the person to whom the diagnosis of single episode of harmful use applies.                     MDMA or related drug dependence, including MDA (6C4C.2)
- 6C4C.1Z** **Harmful pattern of use of MDMA or related drugs, including MDA, unspecified**

<b>6C4C.2</b>	<b>MDMA or related drug dependence, including MDA</b> MDMA or related drug dependence, including MDA is a disorder of regulation of MDMA or related drug use arising from repeated or continuous use of MDMA or related drugs. The characteristic feature is a strong internal drive to use MDMA or related drugs, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use MDMA or related drugs. Physiological features of dependence may also be present, including tolerance to the effects of MDMA or related drugs, withdrawal symptoms following cessation or reduction in use of MDMA or related drugs, or repeated use of MDMA or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if MDMA or related drug use is continuous (daily or almost daily) for at least 3 months.
	<p><b>Exclusions:</b> Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)</p> <p>Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)</p>
<b>6C4C.20</b>	MDMA or related drug dependence, including MDA, current use Current MDMA or related drug dependence, including MDA, with MDMA or related drug use within the past month.
	<p><b>Exclusions:</b> Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)</p> <p>Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)</p>
<b>6C4C.21</b>	MDMA or related drug dependence, including MDA, early full remission After a diagnosis of MDMA or related drug dependence, including MDA, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from MDMA or related drug dependence, including MDA, during a period lasting from between 1 and 12 months.
	<p><b>Exclusions:</b> Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)</p> <p>Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)</p>
<b>6C4C.22</b>	MDMA or related drug dependence, including MDA, sustained partial remission After a diagnosis of MDMA or related drug dependence, including MDA, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in consumption of MDMA or related drugs, including MDA, for more than 12 months, such that even though intermittent or continuing use of MDMA or related drugs, including MDA, has occurred during this period, the definitional requirements for dependence have not been met.
	<p><b>Exclusions:</b> Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)</p> <p>Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)</p>

**6C4C.23** MDMA or related drug dependence, including MDA, sustained full remission  
After a diagnosis of MDMA or related drug dependence, including MDA, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from MDMA or related drugs, including MDA, for 12 months or longer.

***Exclusions:*** Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

**6C4C.2Z** MDMA or related drug dependence, including MDA, unspecified

**6C4C.3** **MDMA or related drug intoxication, including MDA**

MDMA or related drug intoxication, including MDA is a clinically significant transient condition that develops during or shortly after the consumption of MDMA or related drugs that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of MDMA or related drugs and their intensity is closely related to the amount of MDMA or a related drug consumed. They are time-limited and abate as MDMA or a related drug is cleared from the body. Presenting features may include increased or inappropriate sexual interest and activity, anxiety, restlessness, agitation, and sweating. In rare instances, usually in severe intoxication, use of MDMA or related drugs, including MDA can result in dystonia and seizures. Sudden death is a rare but recognised complication.

***Coding Note:*** Code also the causing condition

**6C4C.4** **MDMA or related drug withdrawal, including MDA**

MDMA or related drug withdrawal, including MDA is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of MDMA or related drugs in individuals who have developed MDMA or related drug dependence or have used MDMA or related drugs for a prolonged period or in large amounts. Presenting features of MDMA or related drug withdrawal may include fatigue, lethargy, hypersomnia or insomnia, depressed mood, anxiety, irritability, craving, difficulty in concentrating, and appetite disturbance.

***Coding Note:*** Code also the causing condition

**6C4C.5** **MDMA or related drug-induced delirium, including MDA**

MDMA or related drug-induced delirium, including MDA is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or during the use of MDMA or related drugs. The amount and duration of MDMA or related drug use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

***Coding Note:*** Code also the causing condition

- 6C4C.6 MDMA or related drug-induced psychotic disorder, including MDA**  
MDMA or related drug-induced psychotic disorder, including MDA is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with MDMA or related drugs. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of MDMA or related drug intoxication. The amount and duration of MDMA or related drug use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the MDMA or related drug use, if the symptoms persist for a substantial period of time after cessation of the MDMA or related drug use, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with MDMA or related drug use, including MDA).

<b>6C4D</b>	<b>Disorders due to use of dissociative drugs including ketamine and phencyclidine [PCP]</b>
-------------	--

Disorders due to use of dissociative drugs including ketamine and phencyclidine [PCP] are characterised by the pattern and consequences of dissociative drug use. Dissociative drugs include ketamine and phencyclidine (PCP) and their (comparatively rare) chemical analogues. Ketamine is an intravenous anaesthetic widely used in low- and middle-income countries, particularly in Africa, and in emergency situations. Ketamine is also undergoing evaluation for treatment of some mental disorders (e.g., treatment resistant Depressive Disorders). It is also a widespread drug of nonmedical use in many countries and may be taken by the oral or nasal routes or injected. It produces a sense of euphoria but depending on the dose, emergent hallucinations and dissociation are recognised as unpleasant side effects. Phencyclidine has a more restricted worldwide distribution and also has euphoric and dissociative effects. Its use may result in bizarre behaviour uncharacteristic for the individual, including self-harm. Dissociative Drug Dependence is described but a withdrawal syndrome is not recognized by most authorities. Several Dissociative Drug-Induced Mental Disorders are recognised.

**Exclusions:** Hazardous use of dissociative drugs including ketamine or PCP (QE11.7)

6C4D.0

#### **Episode of harmful use of dissociative drugs including ketamine or PCP**

An episode of use of a dissociative drug, including Ketamine and PCP, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to intoxication with a dissociative drug, including Ketamine and PCP, on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of dissociative drugs, including Ketamine and PCP.

A pattern of episodic or intermittent use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Abuse that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic substance use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.

- Exclusions:**
- Episode of harmful use of other specified psychoactive substance (6C4E.0)
  - Other specified psychoactive substance dependence (6C4E.2)

- 6C4E.11** Harmful pattern of use of other specified psychoactive substance, continuous  
A pattern of continuous (daily or almost daily) use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous substance use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.
- Exclusions:** Episode of harmful use of other specified psychoactive substance (6C4E.0)  
Other specified psychoactive substance dependence (6C4E.2)
- 6C4E.1Z** Harmful pattern of use of other specified psychoactive substance, unspecified
- 6C4E.2** **Other specified psychoactive substance dependence**  
Other specified psychoactive substance dependence is a disorder of regulation of use of a specified substance arising from repeated or continuous use of the specified substance. The characteristic feature is a strong internal drive to use the specified substance, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use the specified substance. Physiological features of dependence may also be present, including tolerance to the effects of the specified substance, withdrawal symptoms following cessation or reduction in use of the specified substance, or repeated use of the specified substance or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if use of the specified substance is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of other specified psychoactive substance (6C4E.0)  
Harmful pattern of use of other specified psychoactive substance (6C4E.1)
- 6C4E.20** Other specified psychoactive substance dependence, current use  
Current Other specified psychoactive substance dependence, with use of the specified psychoactive substance within the past month.
- Exclusions:** Episode of harmful use of other specified psychoactive substance (6C4E.0)  
Harmful pattern of use of other specified psychoactive substance (6C4E.1)

- 6C4E.21** Other specified psychoactive substance dependence, early full remission  
 After a diagnosis of Other specified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from the specified substance during a period lasting between 1 and 12 months.
- Exclusions:**
- Episode of harmful use of other specified psychoactive substance (6C4E.0)
  - Harmful pattern of use of other specified psychoactive substance (6C4E.1)
- 6C4E.22** Other specified psychoactive substance dependence, sustained partial remission  
 After a diagnosis of Other specified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in consumption of the specified substance for more than 12 months, such that even though intermittent or continuing substance use has occurred during this period, the definitional requirements for dependence have not been met.
- Exclusions:**
- Episode of harmful use of other specified psychoactive substance (6C4E.0)
  - Harmful pattern of use of other specified psychoactive substance (6C4E.1)
- 6C4E.23** Other specified psychoactive substance dependence, sustained full remission  
 After a diagnosis of Other specified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from the specified substance for 12 months or longer.
- Exclusions:**
- Episode of harmful use of other specified psychoactive substance (6C4E.0)
  - Harmful pattern of use of other specified psychoactive substance (6C4E.1)
- 6C4E.2Z** Other specified psychoactive substance dependence, unspecified
- 6C4E.3** **Other specified psychoactive substance intoxication**  
 Other specified psychoactive substance intoxication is a clinically significant transient condition that develops during or shortly after the consumption of a specified psychoactive substance or medication that is characterised by disturbances in level of consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of the specified psychoactive substance and their intensity is closely related to the amount of the specified psychoactive substance consumed. They are time-limited and abate as the specified substance is cleared from the body.
- Coding Note:** Code also the causing condition

- 6C4E.4 Other specified psychoactive substance withdrawal**  
Other specified psychoactive substance withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of the specified substance in individuals who have developed dependence or have used the specified substance for a prolonged period or in large amounts. Other specified psychoactive substance withdrawal can also occur when prescribed psychoactive medications have been used in standard therapeutic doses. The specific features of the withdrawal state depend on the pharmacological properties of the specified substance.
- Coding Note:** Code also the causing condition
- 6C4E.40 Other specified psychoactive substance withdrawal, uncomplicated**  
The development of a withdrawal state not accompanied by perceptual disturbances or seizures following cessation or reduction of use of the specified substance.
- Coding Note:** Code also the causing condition
- 6C4E.41 Other specified psychoactive substance withdrawal, with perceptual disturbances**  
The development of a withdrawal state accompanied by perceptual disturbances but not by seizures following cessation or reduction of use of the specified substance.
- Coding Note:** Code also the causing condition
- 6C4E.42 Other specified psychoactive substance withdrawal, with seizures**  
The development of a withdrawal state accompanied by seizures but not by perceptual disturbances following cessation or reduction of use of the specified substance.
- Coding Note:** Code also the causing condition
- 6C4E.43 Other specified psychoactive substance withdrawal, with perceptual disturbances and seizures**  
The development of a withdrawal state accompanied by both perceptual disturbances and seizures following cessation or reduction of use of the specified substance.
- Coding Note:** Code also the causing condition
- 6C4E.4Z Other specified psychoactive substance withdrawal, unspecified**
- Coding Note:** Code also the causing condition

<b>6C4E.5</b>	<b>Delirium induced by other specified psychoactive substance including medications</b> Delirium induced by other specified psychoactive substance is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of a specified psychoactive substance. The amount and duration of use of the specified substance must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.
<b>Coding Note:</b>	Code also the causing condition
<b>6C4E.6</b>	<b>Psychotic disorder induced by other specified psychoactive substance</b> Psychotic disorder induced by other specified psychoactive substance is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganized thinking, grossly disorganized behaviour) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of intoxication with or withdrawal from a specified psychoactive substance. The amount and duration of use of the specified psychoactive substance must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the use of the specified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the specified psychoactive substance or withdrawal from the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with the use of the specified psychoactive substance).
<b>Coding Note:</b>	Code also the causing condition
<b>6C4E.7</b>	<b>Certain other specified psychoactive substance-induced mental or behavioural disorders</b>
<b>Coding Note:</b>	Code also the causing condition

**6C4E.70** Mood disorder induced by other specified psychoactive substance  
Mood disorder induced by other specified psychoactive substance is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of intoxication with or withdrawal from a specified psychoactive substance. The amount and duration of use of the specified psychoactive substance must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the use of the specified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the specified psychoactive substance or withdrawal from the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with the use of the specified psychoactive substance).

**Coding Note:** Code also the causing condition

**6C4E.71** Anxiety disorder induced by other specified psychoactive substance  
Anxiety disorder induced by other specified psychoactive substance is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of intoxication with or withdrawal from a specified psychoactive substance. The amount and duration of use of the specified psychoactive substance must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the use of the specified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the specified psychoactive substance or withdrawal from the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with the use of the specified psychoactive substance).

**Coding Note:** Code also the causing condition

<b>6C4E.72</b>	<p><b>Obsessive-compulsive or related disorder induced by other specified psychoactive substance</b></p> <p>Obsessive-compulsive or related disorder induced by other specified psychoactive substance is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of intoxication with or withdrawal from the specified psychoactive substance. The amount and duration of the specified psychoactive substance use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the specified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with specified psychoactive substance use).</p>
<b>Coding Note:</b>	Code also the causing condition
<b>6C4E.73</b>	<p><b>Impulse control disorder induced by other specified psychoactive substance</b></p> <p>Impulse control disorder induced by other specified psychoactive substance is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of intoxication with or withdrawal from the specified psychoactive substance. The amount and duration of the specified psychoactive substance use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the specified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with specified psychoactive substance use).</p>

<b>6C4E.Y</b>	<b>Other specified disorders due to use of other specified psychoactive substances, including medications</b>
<b>6C4E.Z</b>	<b>Disorders due to use of other specified psychoactive substances, including medications, unspecified</b>

**6C4F****Disorders due to use of multiple specified psychoactive substances, including medications**

Disorders due to use of multiple specified psychoactive substances, including medications are characterised by the pattern and consequences of multiple psychoactive substances. Although this grouping is provided for coding purposes, in most clinical situations it is recommended that multiple specific disorders due to substance use be assigned rather than using categories from this grouping.

**6C4F.0****Episode of harmful use of multiple specified psychoactive substances**

An episode of use of multiple specified psychoactive substances or medications that are not included in the other substance classes specifically identified under Disorder Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to multiple substance intoxication or psychoactive medication use; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to multiple substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of single episode of harmful use of multiple specified psychoactive substances applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of the multiple psychoactive substances.

**Exclusions:** Harmful pattern of use of multiple specified psychoactive substances (6C4F.1)

Multiple specified psychoactive substances dependence  
(6C4F.2)

**6C4F.1****Harmful pattern of use of multiple specified psychoactive substances**

A pattern of use of multiple specified psychoactive substances or medications that are not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of substance use is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to multiple substance intoxication or psychoactive medication use; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to multiple substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of Harmful pattern of use of multiple specified psychoactive substances applies.

**Exclusions:** Episode of harmful use of multiple specified psychoactive substances (6C4F.0)

Multiple specified psychoactive substances dependence  
(6C4F.2)

- 6C4F.10** Harmful pattern of use of multiple specified psychoactive substances, episodic  
A pattern of episodic or intermittent use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic substance use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.
- Exclusions:**
- Episode of harmful use of multiple specified psychoactive substances (6C4F.0)
  - Multiple specified psychoactive substances dependence (6C4F.2)
- 6C4F.11** Harmful pattern of use of multiple specified psychoactive substances, continuous  
A pattern of continuous (daily or almost daily) use of multiple specified psychoactive substances or medications that are not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous substance use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to multiple substance intoxication or psychoactive medication use; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to multiple substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of Harmful pattern of multiple specified psychoactive substances applies.
- Exclusions:**
- Episode of harmful use of multiple specified psychoactive substances (6C4F.0)
  - Multiple specified psychoactive substances dependence (6C4F.2)
- 6C4F.1Z** Harmful pattern of use of multiple specified psychoactive substances, unspecified

<b>6C4F.2</b>	<b>Multiple specified psychoactive substances dependence</b> Multiple specified psychoactive substance dependence is a disorder of regulation of use of multiple specified substances arising from repeated or continuous use of the specified substances. The characteristic feature is a strong internal drive to use the specified substances, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use the specified substances. Physiological features of dependence may also be present, including tolerance to the effects of the specified substances, withdrawal symptoms following cessation or reduction in use of the specified substances, or repeated use of the specified substances or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if use of the specified substances is continuous (daily or almost daily) for at least 3 months.

- 6C4F.43     Multiple specified psychoactive substances withdrawal, with perceptual disturbances and seizures**  
**Coding Note:** Code also the causing condition
- 6C4F.4Y     Other specified multiple specified psychoactive substances withdrawal**  
**Coding Note:** Code also the causing condition
- 6C4F.4Z     Multiple specified psychoactive substances withdrawal, unspecified**  
**Coding Note:** Code also the causing condition

**6C4F.5 Delirium induced by multiple specified psychoactive substances including medications**

Delirium induced by multiple specified psychoactive substances is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of multiple specified substances. The amount and duration of use of the multiple specified substances must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a substance other than those specified, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders. Note that this diagnosis applies only to those situations in which delirium is present but it cannot be determined which of multiple psychoactive substances is the cause of the delirium. In cases of multiple psychoactive substance use in which more than one specific substance can be identified as a cause of the delirium, the corresponding specific substance-induced delirium diagnoses should be given instead.

**Coding Note:** Code also the causing condition

**6C4F.6 Psychotic disorder induced by multiple specified psychoactive substances**

Psychotic disorder induced by multiple specified psychoactive substances is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganized thinking, grossly disorganized behaviour) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of intoxication with or withdrawal from multiple specified psychoactive substances. The amount and duration of use of the multiple specified psychoactive substances must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the use of the multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the use of the multiple specified psychoactive substances or withdrawal from the multiple specified psychoactive substances, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with the use of the multiple specified psychoactive substances).

<b>6C4F.Y</b>	<b>Other specified disorders due to use of multiple specified psychoactive substances, including medications</b>
<b>6C4F.Z</b>	<b>Disorders due to use of multiple specified psychoactive substances, including medications, unspecified</b>

**6C4G****Disorders due to use of unknown or unspecified psychoactive substances**

Disorders due to use of unknown or unspecified psychoactive substances are characterised by the pattern and consequences of psychoactive substance use when the specific substance is unknown or unspecified. These categories may be used in clinical situations in which it is clear that the disturbance is due to substance use but the specific class of substance is unknown. Once the relevant substance is identified, the disturbance should be recoded under the appropriate substance class.

**6C4G.0****Episode of harmful use of unknown or unspecified psychoactive substances**

An episode of use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication or withdrawal; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to substance intoxication or withdrawal on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of the unknown or unspecified psychoactive substance.

**Exclusions:**      Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

Unknown or unspecified psychoactive substance dependence  
(6C4G.2)

**6C4G.1****Harmful pattern of use of unknown or unspecified psychoactive substance**

A pattern of use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of substance use is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of unknown or unspecified psychoactive substance applies.

**Exclusions:**      Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Unknown or unspecified psychoactive substance dependence  
(6C4G.2)

- 6C4G.10** Harmful pattern of use of unknown or unspecified psychoactive substance, episodic  
A pattern of episodic or intermittent use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic substance use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of unknown or unspecified psychoactive substance applies.
- Exclusions:**
- Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)
  - Unknown or unspecified psychoactive substance dependence (6C4G.2)
- 6C4G.11** Harmful pattern of use of unknown or unspecified psychoactive substance, continuous  
A pattern of continuous (daily or almost daily) use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous substance use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of unknown or unspecified psychoactive substance applies.
- Exclusions:**
- Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)
  - Unknown or unspecified psychoactive substance dependence (6C4G.2)
- 6C4G.1Z** Harmful pattern of use of unknown or unspecified psychoactive substance, unspecified

<b>6C4G.2</b>	<b>Unknown or unspecified psychoactive substance dependence</b> Unknown or unspecified psychoactive substance dependence is a disorder of regulation of use of an unknown or unspecified substance arising from repeated or continuous use of the substance. The characteristic feature is a strong internal drive to use the unknown or unspecified substance, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use the unknown or unspecified substance. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if use of the unknown or unspecified substance is continuous (daily or almost daily) for at least 3 months.
	<b>Exclusions:</b> Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)  Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)
<b>6C4G.20</b>	Unknown or unspecified psychoactive substance dependence, current use Current dependence on an unknown or unspecified psychoactive substance, with use of the substance within the past month.  <b>Exclusions:</b> Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)  Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)
<b>6C4G.21</b>	Unknown or unspecified psychoactive substance dependence, early full remission After a diagnosis of Unknown or unspecified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from the substance during a period lasting between 1 and 12 months.  <b>Exclusions:</b> Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)  Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)
<b>6C4G.22</b>	Unknown or unspecified psychoactive substance dependence, sustained partial remission After a diagnosis of Unknown or unspecified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in consumption of the substance for more than 12 months, such that even though intermittent or continuing use of the substance has occurred during this period, the definitional requirements for dependence have not been met.  <b>Exclusions:</b> Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)  Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

<b>6C4G.23</b>	Unknown or unspecified psychoactive substance dependence, sustained full remission  After a diagnosis of Unknown or unspecified psychoactive substance dependence, sustained full remission, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from the substance for 12 months or longer.
	<b><i>Exclusions:</i></b> Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)  Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)
<b>6C4G.2Z</b>	Unknown or unspecified psychoactive substance dependence, substance and state of remission unspecified
<b>6C4G.3</b>	<b>Intoxication due to unknown or unspecified psychoactive substance</b>  Intoxication due to unknown or unspecified psychoactive substance is a transient condition that develops during or shortly after the administration of an unknown or unspecified psychoactive substance that is characterised by disturbances in level of consciousness, cognition, perception, affect or behaviour, or other psychophysiological functions and responses. This diagnosis should be made only when there is strong evidence that an unidentified substance has been taken and the features cannot be accounted for by another disorder or disease.
<b>Coding Note:</b>	Code also the causing condition
<b>6C4G.4</b>	<b>Withdrawal due to unknown or unspecified psychoactive substance</b>  Withdrawal due to unknown or unspecified psychoactive substance is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of an unknown or unspecified substance in individuals who have developed dependence or have used the unknown or unspecified substance for a prolonged period or in large amounts. Withdrawal due to unknown or unspecified psychoactive substance can also occur when prescribed psychoactive medications have been used in standard therapeutic doses. The specific features of the withdrawal state depend on the pharmacological properties of the unknown or unspecified substance.
<b>Coding Note:</b>	Code also the causing condition
<b>6C4G.40</b>	Withdrawal due to unknown or unspecified psychoactive substance, uncomplicated  All diagnostic requirements for Withdrawal due to unknown or unspecified psychoactive substance are met and the withdrawal state is not accompanied by perceptual disturbances or seizures.
<b>Coding Note:</b>	Code also the causing condition

- 6C4G.41** Withdrawal due to unknown or unspecified psychoactive substance, with perceptual disturbances  
All diagnostic requirements for Withdrawal due to unknown or unspecified psychoactive substance are met and the withdrawal state is accompanied by perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. There is no evidence of confusion and other diagnostic requirements for Delirium are not met. The withdrawal state is not accompanied by seizures.
- Coding Note:** Code also the causing condition
- 6C4G.42** Withdrawal due to unknown or unspecified psychoactive substance, with seizures  
All diagnostic requirements for Withdrawal due to unknown or unspecified psychoactive substance are met and the withdrawal state is accompanied by seizures (i.e., generalised tonic-clonic seizures) but not by perceptual disturbances.
- Coding Note:** Code also the causing condition
- 6C4G.43** Withdrawal due to unknown or unspecified psychoactive, with perceptual disturbances and seizures  
The development of a withdrawal syndrome accompanied by both perceptual disturbances and seizures following cessation or reduction of use of the unknown or unspecified substance.
- Coding Note:** Code also the causing condition
- 6C4G.4Z** Withdrawal due to unknown or unspecified psychoactive substance, unspecified
- Coding Note:** Code also the causing condition
- 6C4G.5** **Delirium induced by unknown or unspecified psychoactive substance**  
Delirium induced by unknown or unspecified psychoactive substance is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of an unknown or unspecified substance. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from another substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.
- Coding Note:** Code also the causing condition

- 6C4G.6      Psychotic disorder induced by unknown or unspecified psychoactive substance**
- Psychotic disorder induced by unknown or unspecified psychoactive substance is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the use of the unknown or unspecified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the unknown or unspecified psychoactive substance or withdrawal from the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with the use of the unknown or unspecified psychoactive substance).
- Coding Note:** Code also the causing condition
- 6C4G.7      Certain unknown or unspecified psychoactive substance-induced mental or behavioural disorders**
- Coding Note:** Code also the causing condition
- 6C4G.70      Mood disorder induced by unknown or unspecified psychoactive substance**
- Mood disorder induced by unknown or unspecified psychoactive substance is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the use of the unknown or unspecified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the unknown or unspecified psychoactive substance or withdrawal from the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with the use of the unknown or unspecified psychoactive substance).
- Coding Note:** Code also the causing condition

**6C4G.71** Anxiety disorder induced by unknown or unspecified psychoactive substance  
Anxiety disorder induced by unknown or unspecified psychoactive substance is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the use of the unknown or unspecified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the unknown or unspecified psychoactive substance or withdrawal from the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with the use of the unknown or unspecified psychoactive substance).

**Coding Note:** Code also the causing condition

**6C4G.72** Obsessive-compulsive or related disorder induced by unknown or unspecified psychoactive substance  
Obsessive-compulsive or related disorder induced by unknown or unspecified psychoactive substance is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the unknown or unspecified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with the unknown or unspecified psychoactive substance use).

**Coding Note:** Code also the causing condition

<b>6C4G.73</b>	Impulse control disorder induced by unknown or unspecified psychoactive substance  Impulse control disorder induced by unknown or unspecified psychoactive substance is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the unknown or unspecified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with the unknown or unspecified psychoactive substance use).
----------------	--

**6C4G.Y** **Other specified disorders due to use of unknown or unspecified psychoactive substances**

**6C4G.Z** **Disorders due to use of unknown or unspecified psychoactive substances, unspecified**

## **6C4H Disorders due to use of non-psychoactive substances**

Disorders due to use of non-psychoactive substances are characterised by the pattern and consequences of non-medical use of non-psychoactive substances. Non-psychoactive substances include laxatives, anabolic steroids, growth hormone, erythropoietin, and non-steroidal anti-inflammatory drugs. They may also include proprietary or over-the-counter medicines and folk remedies. Non-medical use of these substances may be associated with harm to the individual due to the direct or secondary toxic effects of the non-psychoactive substance on body organs and systems, or a harmful route of administration (e.g., infections due to intravenous self-administration). They are not associated with intoxication or with a dependence or withdrawal syndrome and are not recognized causes of substance-induced mental disorders.

### **6C4H.0 Episode of harmful use of non-psychoactive substances**

An episode of use of a non-psychoactive substance that has caused damage to a person's physical or mental health. Harm to health of the individual occurs due to direct or secondary toxic effects on body organs and systems or a harmful route of administration. This diagnosis should not be made if the harm is attributed to a known pattern of non-psychoactive substance use.

**Exclusions:** Harmful pattern of use of non-psychoactive substances  
(6C4H.1)

- 6C4H.1** **Harmful pattern of use of non-psychoactive substances**  
A pattern of use of non-psychoactive substances that has caused clinically significant harm to a person's physical or mental health. The pattern of use is evident over a period of at least 12 months if use is episodic and at least one month if use is continuous (i.e., daily or almost daily). Harm may be caused by the direct or secondary toxic effects of the substance on body organs and systems, or a harmful route of administration.
- Exclusions:**
- Harmful pattern of use of other specified psychoactive substance (6C4E.1)
  - Episode of harmful use of non-psychoactive substances (6C4H.0)
- 6C4H.10** Harmful pattern of use of non-psychoactive substances, episodic  
A pattern of episodic or intermittent use of a non-psychoactive substance that has caused damage to a person's physical or mental health. The pattern of episodic or intermittent use of the non-psychoactive substance is evident over a period of at least 12 months. Harm may be caused by the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.
- 6C4H.11** Harmful pattern of use of non-psychoactive substances, continuous  
A pattern of continuous use of a non-psychoactive substance (daily or almost daily) that has caused damage to a person's physical or mental health. The pattern of continuous use of the non-psychoactive substance is evident over a period of at least one month. Harm may be caused by the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.
- 6C4H.1Z** Harmful pattern of use of non-psychoactive substances, unspecified
- 6C4H.Y** **Other specified disorders due to use of non-psychoactive substances**
- 6C4H.Z** **Disorders due to use of non-psychoactive substances, unspecified**
- 6C4Y** **Other specified disorders due to substance use**
- 6C4Z** **Disorders due to substance use, unspecified**

## Disorders due to addictive behaviours (6C50-6C5Z)

Disorders due to addictive behaviours are recognizable and clinically significant syndromes associated with distress or interference with personal functions that develop as a result of repetitive rewarding behaviours other than the use of dependence-producing substances. Disorders due to addictive behaviours include gambling disorder and gaming disorder, which may involve both online and offline behaviour.

- Exclusions:** Compulsive sexual behaviour disorder (6C72)  
Paraphilic disorders (6D30-6D3Z)

**6C50**

### Gambling disorder

Gambling disorder is characterised by a pattern of persistent or recurrent gambling behaviour, which may be online (i.e., over the internet) or offline, manifested by:

1. impaired control over gambling (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gambling to the extent that gambling takes precedence over other life interests and daily activities; and
3. continuation or escalation of gambling despite the occurrence of negative consequences.

The pattern of gambling behaviour may be continuous or episodic and recurrent. The pattern of gambling behaviour results in significant distress or in significant impairment in personal, family, social, educational, occupational or other important areas of functioning. The gambling behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

- Inclusions:** Compulsive gambling  
**Exclusions:** Bipolar type I disorder (6A60)  
Bipolar type II disorder (6A61)  
Hazardous gambling or betting (QE21)

### 6C50.0      Gambling disorder, predominantly offline

Gambling disorder, predominantly offline is characterised by a pattern of persistent or recurrent gambling behaviour that is not primarily conducted over the internet and is manifested by:

1. impaired control over gambling (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gambling to the extent that gambling takes precedence over other life interests and daily activities; and
3. continuation or escalation of gambling despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gambling behaviour may be continuous or episodic and recurrent. The gambling behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

- Exclusions:** Hazardous gambling or betting (QE21)

## **6C50.1                  Gambling disorder, predominantly online**

Gambling disorder, predominantly online is characterised by a pattern of persistent or recurrent gambling behaviour that is primarily conducted over the internet and is manifested by:

1. impaired control over gambling (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gambling to the extent that gambling takes precedence over other life interests and daily activities; and
3. continuation or escalation of gambling despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gambling behaviour may be continuous or episodic and recurrent. The gambling behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

***Exclusions:***              Hazardous gambling or betting (QE21)

## **6C50.Z                  Gambling disorder, unspecified**

### **6C51                  Gaming disorder**

Gaming disorder is characterised by a pattern of persistent or recurrent gaming behaviour ('digital gaming' or 'video-gaming'), which may be online (i.e., over the internet) or offline, manifested by:

1. impaired control over gaming (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gaming to the extent that gaming takes precedence over other life interests and daily activities; and
3. continuation or escalation of gaming despite the occurrence of negative consequences.

The pattern of gaming behaviour may be continuous or episodic and recurrent. The pattern of gaming behaviour results in marked distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. The gaming behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

***Exclusions:***              Hazardous gaming (QE22)

                                  Bipolar type I disorder (6A60)

                                  Bipolar type II disorder (6A61)

## **6C51.0                  Gaming disorder, predominantly online**

Gaming disorder, predominantly online is characterised by a pattern of persistent or recurrent gaming behaviour ('digital gaming' or 'video-gaming') that is primarily conducted over the internet and is manifested by:

1. impaired control over gaming (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gaming to the extent that gaming takes precedence over other life interests and daily activities; and

3. continuation or escalation of gaming despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gaming behaviour may be continuous or episodic and recurrent. The gaming behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

**6C51.1                  Gaming disorder, predominantly offline**

Gaming disorder, predominantly offline is characterised by a pattern of persistent or recurrent gaming behaviour ('digital gaming' or 'video-gaming') that is not primarily conducted over the internet and is manifested by:

1. impaired control over gaming (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gaming to the extent that gaming takes precedence over other life interests and daily activities; and
3. continuation or escalation of gaming despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gaming behaviour may be continuous or episodic and recurrent. The gaming behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

**6C51.Z                  Gaming disorder, unspecified**

**6C5Y                  Other specified disorders due to addictive behaviours**

**6C5Z                  Disorders due to addictive behaviours, unspecified**

## Impulse control disorders (6C70-6C7Z)

Impulse control disorders are characterised by the repeated failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite consequences such as longer-term harm either to the individual or to others, marked distress about the behaviour pattern, or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. Impulse Control Disorders involve a range of specific behaviours, including fire-setting, stealing, sexual behaviour, and explosive outbursts.

**Coded Elsewhere:** Substance-induced impulse control disorders

- Gambling disorder (6C50)
- Gaming disorder (6C51)
- Secondary impulse control syndrome (6E66)
- Body-focused repetitive behaviour disorders (6B25)

**6C70**

### Pyromania

Pyromania is characterised by a recurrent failure to control strong impulses to set fires, resulting in multiple acts of, or attempts at, setting fire to property or other objects, in the absence of an apparent motive (e.g., monetary gain, revenge, sabotage, political statement, attracting attention or recognition). There is an increasing sense of tension or affective arousal prior to instances of fire setting, persistent fascination or preoccupation with fire and related stimuli (e.g., watching fires, building fires, fascination with firefighting equipment), and a sense of pleasure, excitement, relief or gratification during, and immediately after the act of setting the fire, witnessing its effects, or participating in its aftermath. The behaviour is not better explained by intellectual impairment, another mental and behavioural disorder, or substance intoxication.

**Inclusions:** pathological fire-setting

**Exclusions:** Conduct-dissocial disorder (6C91)

Bipolar type I disorder (6A60)

Schizophrenia or other primary psychotic disorders  
(6A20-6A2Z)

Fire-setting as the reason for observation for suspected mental or behavioural disorders, ruled out (QA02.3)

**6C71**

### Kleptomania

Kleptomania is characterised by a recurrent failure to control strong impulses to steal objects in the absence of an apparent motive (e.g., objects are not acquired for personal use or monetary gain). There is an increasing sense of tension or affective arousal before instances of theft and a sense of pleasure, excitement, relief, or gratification during and immediately after the act of stealing. The behaviour is not better explained by intellectual impairment, another mental and behavioural disorder, or substance intoxication.

**Coding Note:** If stealing occurs within the context of conduct-dissocial disorder or a manic episode, Kleptomania should not be diagnosed separately.

**Inclusions:** pathological stealing

**Exclusions:** shoplifting as the reason for observation for suspected mental disorder, ruled out (QA02.3)

**6C72****Compulsive sexual behaviour disorder**

Compulsive sexual behaviour disorder is characterised by a persistent pattern of failure to control intense, repetitive sexual impulses or urges resulting in repetitive sexual behaviour. Symptoms may include repetitive sexual activities becoming a central focus of the person's life to the point of neglecting health and personal care or other interests, activities and responsibilities; numerous unsuccessful efforts to significantly reduce repetitive sexual behaviour; and continued repetitive sexual behaviour despite adverse consequences or deriving little or no satisfaction from it. The pattern of failure to control intense, sexual impulses or urges and resulting repetitive sexual behaviour is manifested over an extended period of time (e.g., 6 months or more), and causes marked distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. Distress that is entirely related to moral judgments and disapproval about sexual impulses, urges, or behaviours is not sufficient to meet this requirement.

**Exclusions:** Paraphilic disorders (6D30-6D3Z)

**6C73****Intermittent explosive disorder**

Intermittent explosive disorder is characterised by repeated brief episodes of verbal or physical aggression or destruction of property that represent a failure to control aggressive impulses, with the intensity of the outburst or degree of aggressiveness being grossly out of proportion to the provocation or precipitating psychosocial stressors. The symptoms are not better explained by another mental, behavioural, or neurodevelopmental disorder and are not part of a pattern of chronic anger and irritability (e.g., in oppositional defiant disorder). The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Exclusions:** Oppositional defiant disorder (6C90)

**6C7Y****Other specified impulse control disorders****6C7Z****Impulse control disorders, unspecified**

## **Disruptive behaviour or dissocial disorders (6C90-6C9Z)**

Disruptive behaviour and dissocial disorders are characterised by persistent behaviour problems that range from markedly and persistently defiant, disobedient, provocative or spiteful (i.e., disruptive) behaviours to those that persistently violate the basic rights of others or major age-appropriate societal norms, rules, or laws (i.e., dissocial). Onset of Disruptive and dissocial disorders is commonly, though not always, during childhood.

**6C90**

### **Oppositional defiant disorder**

Oppositional defiant disorder is a persistent pattern (e.g., 6 months or more) of markedly defiant, disobedient, provocative or spiteful behaviour that occurs more frequently than is typically observed in individuals of comparable age and developmental level and that is not restricted to interaction with siblings. Oppositional defiant disorder may be manifest in prevailing, persistent angry or irritable mood, often accompanied by severe temper outbursts or in headstrong, argumentative and defiant behaviour. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning

**6C90.0**

### **Oppositional defiant disorder with chronic irritability-anger**

All definitional requirements for oppositional defiant disorder are met. This form of oppositional defiant disorder is characterised by prevailing, persistent angry or irritable mood that may be present independent of any apparent provocation. The negative mood is often accompanied by regularly occurring severe temper outbursts that are grossly out of proportion in intensity or duration to the provocation. Chronic irritability and anger are characteristic of the individual's functioning nearly every day, are observable across multiple settings or domains of functioning (e.g., home, school, social relationships), and are not restricted to the individual's relationship with his/her parents or guardians. The pattern of chronic irritability and anger is not limited to occasional episodes (e.g., developmentally typical irritability) or discrete periods (e.g., irritable mood in the context of manic or depressive episodes).

**6C90.00**

Oppositional defiant disorder with chronic irritability-anger with limited prosocial emotions

All definitional requirements for oppositional defiant disorder with chronic irritability-anger are met. In addition, the individual exhibits characteristics that are sometimes referred to as 'callous and unemotional'. These characteristics include a lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress; a lack of remorse, shame or guilt over their own behaviour (unless prompted by being apprehended), a relative indifference to the probability of punishment; a lack of concern over poor performance in school or work; and limited expression of emotions, particularly positive or loving feelings toward others, or only doing so in ways that seem shallow, insincere, or instrumental.

**6C90.01**

Oppositional defiant disorder with chronic irritability-anger with typical prosocial emotions

All definitional requirements for oppositional defiant disorder with chronic irritability-anger are met. The individual does not exhibit characteristics referred to as 'callous and unemotional', such as lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress.

**6C90.0Z**

Oppositional defiant disorder with chronic irritability-anger, unspecified

- 6C90.1** **Oppositional defiant disorder without chronic irritability-anger**  
Meets all definitional requirements for oppositional defiant disorder. This form of oppositional defiant disorder is not characterised by prevailing, persistent, angry or irritable mood, but does feature headstrong, argumentative, and defiant behaviour.
- 6C90.10** Oppositional defiant disorder without chronic irritability-anger with limited prosocial emotions  
All definitional requirements for oppositional defiant disorder without chronic irritability-anger are met. In addition, the individual exhibits characteristics that are sometimes referred to as 'callous and unemotional'. These characteristics include a lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress; a lack of remorse, shame or guilt over their own behaviour (unless prompted by being apprehended), a relative indifference to the probability of punishment; a lack of concern over poor performance in school or work; and limited expression of emotions, particularly positive or loving feelings toward others, or only doing so in ways that seem shallow, insincere, or instrumental. This pattern is pervasive across situations and relationships (i.e., the qualifier should not be applied based on a single characteristic, a single relationship, or a single instance of behaviour) and is persistent over time (e.g., at least 1 year).
- 6C90.11** Oppositional defiant disorder without chronic irritability-anger with typical prosocial emotions  
All definitional requirements for oppositional defiant disorder without chronic irritability-anger are met. The individual does not exhibit characteristics referred to as 'callous and unemotional', such as lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress.
- 6C90.1Z** Oppositional defiant disorder without chronic irritability-anger, unspecified
- 6C90.Z** **Oppositional defiant disorder, unspecified**
- 6C91** **Conduct-dissocial disorder**  
Conduct-dissocial disorder is characterised by a repetitive and persistent pattern of behaviour in which the basic rights of others or major age-appropriate societal norms, rules, or laws are violated such as aggression towards people or animals; destruction of property; deceitfulness or theft; and serious violations of rules. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning. To be diagnosed, the behaviour pattern must be enduring over a significant period of time (e.g., 12 months or more). Isolated dissocial or criminal acts are thus not in themselves grounds for the diagnosis.
- 6C91.0** **Conduct-dissocial disorder, childhood onset**  
Conduct-dissocial disorder, childhood onset is characterised by a repetitive and persistent pattern of behaviour in which the basic rights of others or major age-appropriate societal norms, rules, or laws are violated such as aggression towards people or animals; destruction of property; deceitfulness or theft; and serious violations of rules. To be diagnosed, features of the disorder must be present during childhood prior to adolescence (e.g., before 10 years of age) and the behaviour pattern must be enduring over a significant period of time (e.g., 12 months or more). Isolated dissocial or criminal acts are thus not in themselves grounds for the diagnosis.

<b>6C91.00</b>	Conduct-dissocial disorder, childhood onset with limited prosocial emotions Meets all definitional requirements for Conduct-dissocial disorder, childhood onset. In addition, the individual exhibits characteristics that are sometimes referred to as 'callous and unemotional'. These characteristics include a lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress; a lack of remorse, shame or guilt over their own behaviour (unless prompted by being apprehended), a relative indifference to the probability of punishment; a lack of concern over poor performance in school or work; and limited expression of emotions, particularly positive or loving feelings toward others, or only doing so in ways that seem shallow, insincere, or instrumental.
<b>6C91.01</b>	Conduct-dissocial disorder, childhood onset with typical prosocial emotions All definitional requirements for conduct-dissocial disorder, childhood onset are met. The individual does not exhibit characteristics referred to as 'callous and unemotional', such as lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress.
<b>6C91.0Z</b>	Conduct-dissocial disorder, childhood onset, unspecified
<b>6C91.1</b>	<b>Conduct-dissocial disorder, adolescent onset</b> Conduct-dissocial disorder, adolescent onset is characterised by a repetitive and persistent pattern of behaviour in which the basic rights of others or major age-appropriate societal norms, rules, or laws are violated such as aggression towards people or animals; destruction of property; deceitfulness or theft; and serious violations of rules. No features of the disorder are present during childhood prior to adolescence (e.g., before 10 years of age). To be diagnosed, the behaviour pattern must be enduring over a significant period of time (e.g., 12 months or more). Isolated dissocial or criminal acts are thus not in themselves grounds for the diagnosis.
<b>6C91.10</b>	Conduct-dissocial disorder, adolescent onset with limited prosocial emotions All definitional requirements for conduct-dissocial disorder, adolescent onset are met. In addition, the individual exhibits characteristics that are sometimes referred to as 'callous and unemotional'. These characteristics include a lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress; a lack of remorse, shame or guilt over their own behaviour (unless prompted by being apprehended), a relative indifference to the probability of punishment; a lack of concern over poor performance in school or work; and limited expression of emotions, particularly positive or loving feelings toward others, or only doing so in ways that seem shallow, insincere, or instrumental.
<b>6C91.11</b>	Conduct-dissocial disorder, adolescent onset with typical prosocial emotions All definitional requirements for conduct-dissocial disorder, adolescent onset are met. The individual does not exhibit characteristics referred to as 'callous and unemotional', such as lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress.

**Disruptive behaviour or dissocial disorders, unspecified**

**Personality disorders and related traits (6D10-6D11.5)**

**Coded Elsewhere:** Secondary personality change (6E68)

**6D10**

**Personality disorder**

Personality disorder is characterised by problems in functioning of aspects of the self (e.g., identity, self-worth, accuracy of self-view, self-direction), and/or interpersonal dysfunction (e.g., ability to develop and maintain close and mutually satisfying relationships, ability to understand others' perspectives and to manage conflict in relationships) that have persisted over an extended period of time (e.g., 2 years or more). The disturbance is manifest in patterns of cognition, emotional experience, emotional expression, and behaviour that are maladaptive (e.g., inflexible or poorly regulated) and is manifest across a range of personal and social situations (i.e., is not limited to specific relationships or social roles). The patterns of behaviour characterizing the disturbance are not developmentally appropriate and cannot be explained primarily by social or cultural factors, including socio-political conflict. The disturbance is associated with substantial distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6D10.0**

**Mild personality disorder**

All general diagnostic requirements for Personality Disorder are met. Disturbances affect some areas of personality functioning but not others (e.g., problems with self-direction in the absence of problems with stability and coherence of identity or self-worth), and may not be apparent in some contexts. There are problems in many interpersonal relationships and/or in performance of expected occupational and social roles, but some relationships are maintained and/or some roles carried out. Specific manifestations of personality disturbances are generally of mild severity. Mild Personality Disorder is typically not associated with substantial harm to self or others, but may be associated with substantial distress or with impairment in personal, family, social, educational, occupational or other important areas of functioning that is either limited to circumscribed areas (e.g., romantic relationships; employment) or present in more areas but milder.

**6D10.1**

**Moderate personality disorder**

All general diagnostic requirements for Personality Disorder are met. Disturbances affect multiple areas of personality functioning (e.g., identity or sense of self, ability to form intimate relationships, ability to control impulses and modulate behaviour). However, some areas of personality functioning may be relatively less affected. There are marked problems in most interpersonal relationships and the performance of most expected social and occupational roles is compromised to some degree. Relationships are likely to be characterised by conflict, avoidance, withdrawal, or extreme dependency (e.g., few friendships maintained, persistent conflict in work relationships and consequent occupational problems, romantic relationships characterised by serious disruption or inappropriate submissiveness). Specific manifestations of personality disturbance are generally of moderate severity. Moderate Personality Disorder is sometimes associated with harm to self or others, and is associated with marked impairment in personal, family, social, educational, occupational or other important areas of functioning, although functioning in circumscribed areas may be maintained.

**6D10.2**

**Severe personality disorder**

All general diagnostic requirements for Personality Disorder are met. There are severe disturbances in functioning of the self (e.g., sense of self may be so unstable that individuals report not having a sense of who they are or so rigid that they refuse to participate in any but an extremely narrow range of situations; self view may be characterised by self-contempt or be grandiose or highly eccentric). Problems in interpersonal functioning seriously affect virtually all relationships and the ability and willingness to perform expected social and occupational roles is absent or severely compromised. Specific manifestations of personality disturbance are severe and affect most, if not all, areas of personality functioning. Severe Personality Disorder is often associated with harm to self or others, and is associated with severe impairment in all or nearly all areas of life, including personal, family, social, educational, occupational, and other important areas of functioning.

**6D10.Z**

**Personality disorder, severity unspecified**

**6D11**

**Prominent personality traits or patterns**

Trait domain qualifiers may be applied to Personality Disorders or Personality Difficulty to describe the characteristics of the individual's personality that are most prominent and that contribute to personality disturbance. Trait domains are continuous with normal personality characteristics in individuals who do not have Personality Disorder or Personality Difficulty. Trait domains are not diagnostic categories, but rather represent a set of dimensions that correspond to the underlying structure of personality. As many trait domain qualifiers may be applied as necessary to describe personality functioning. Individuals with more severe personality disturbance tend to have a greater number of prominent trait domains.

- 6D11.0      Negative affectivity in personality disorder or personality difficulty**
- The core feature of the Negative Affectivity trait domain is the tendency to experience a broad range of negative emotions. Common manifestations of Negative Affectivity, not all of which may be present in a given individual at a given time, include: experiencing a broad range of negative emotions with a frequency and intensity out of proportion to the situation; emotional lability and poor emotion regulation; negativistic attitudes; low self-esteem and self-confidence; and mistrustfulness.
- Coding Note:** This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.
- 6D11.1      Detachment in personality disorder or personality difficulty**
- The core feature of the Detachment trait domain is the tendency to maintain interpersonal distance (social detachment) and emotional distance (emotional detachment). Common manifestations of Detachment, not all of which may be present in a given individual at a given time, include: social detachment (avoidance of social interactions, lack of friendships, and avoidance of intimacy); and emotional detachment (reserve, aloofness, and limited emotional expression and experience).
- Coding Note:** This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.
- 6D11.2      Dissociality in personality disorder or personality difficulty**
- The core feature of the Dissociality trait domain is disregard for the rights and feelings of others, encompassing both self-centeredness and lack of empathy. Common manifestations of Dissociality, not all of which may be present in a given individual at a given time, include: self-centeredness (e.g., sense of entitlement, expectation of others' admiration, positive or negative attention-seeking behaviours, concern with one's own needs, desires and comfort and not those of others); and lack of empathy (i.e., indifference to whether one's actions inconvenience or hurt others, which may include being deceptive, manipulative, and exploitative of others, being mean and physically aggressive, callousness in response to others' suffering, and ruthlessness in obtaining one's goals).
- Coding Note:** This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.
- 6D11.3      Disinhibition in personality disorder or personality difficulty**
- The core feature of the Disinhibition trait domain is the tendency to act rashly based on immediate external or internal stimuli (i.e., sensations, emotions, thoughts), without consideration of potential negative consequences. Common manifestations of Disinhibition, not all of which may be present in a given individual at a given time, include: impulsivity; distractibility; irresponsibility; recklessness; and lack of planning.
- Coding Note:** This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

<b>6D11.4</b>	<b>Anankastia in personality disorder or personality difficulty</b> The core feature of the Anankastia trait domain is a narrow focus on one's rigid standard of perfection and of right and wrong, and on controlling one's own and others' behaviour and controlling situations to ensure conformity to these standards. Common manifestations of Anankastia, not all of which may be present in a given individual at a given time, include: perfectionism (e.g., concern with social rules, obligations, and norms of right and wrong, scrupulous attention to detail, rigid, systematic, day-to-day routines, hyper-scheduling and planfulness, emphasis on organisation, orderliness, and neatness); and emotional and behavioural constraint (e.g., rigid control over emotional expression, stubbornness and inflexibility, risk-avoidance, perseveration, and deliberativeness).
<b>Coding Note:</b>	This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.
<b>6D11.5</b>	<b>Borderline pattern</b> The Borderline pattern specifier may be applied to individuals whose pattern of personality disturbance is characterised by a pervasive pattern of instability of interpersonal relationships, self-image, and affects, and marked impulsivity, as indicated by many of the following: Frantic efforts to avoid real or imagined abandonment; A pattern of unstable and intense interpersonal relationships; Identity disturbance, manifested in markedly and persistently unstable self-image or sense of self; A tendency to act rashly in states of high negative affect, leading to potentially self-damaging behaviours; Recurrent episodes of self-harm; Emotional instability due to marked reactivity of mood; Chronic feelings of emptiness; Inappropriate intense anger or difficulty controlling anger; Transient dissociative symptoms or psychotic-like features in situations of high affective arousal.
<b>Coding Note:</b>	This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

## Paraphilic disorders (6D30-6D3Z)

Paraphilic disorders are characterised by persistent and intense patterns of atypical sexual arousal, manifested by sexual thoughts, fantasies, urges, or behaviours, the focus of which involves others whose age or status renders them unwilling or unable to consent and on which the person has acted or by which he or she is markedly distressed. Paraphilic disorders may include arousal patterns involving solitary behaviours or consenting individuals only when these are associated with marked distress that is not simply a result of rejection or feared rejection of the arousal pattern by others or with significant risk of injury or death.

**Inclusions:** paraphilias

### **6D30      Exhibitionistic disorder**

Exhibitionistic disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—that involves exposing one's genitals to an unsuspecting individual in public places, usually without inviting or intending closer contact. In addition, in order for Exhibitionistic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Exhibitionistic Disorder specifically excludes consensual exhibitionistic behaviours that occur with the consent of the person or persons involved as well as socially sanctioned forms of exhibitionism.

**6D31****Voyeuristic disorder**

Voyeuristic disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—that involves observing an unsuspecting individual who is naked, in the process of disrobing, or engaging in sexual activity. In addition, in order for Voyeuristic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Voyeuristic Disorder specifically excludes consensual voyeuristic behaviours that occur with the consent of the person or persons being observed.

**6D32****Pedophilic disorder**

Pedophilic disorder is characterised by a sustained, focused, and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—Involving pre-pubertal children. In addition, in order for Pedophilic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. This diagnosis does not apply to sexual behaviours among pre- or post-pubertal children with peers who are close in age.

**6D33****Coercive sexual sadism disorder**

Coercive sexual sadism disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges or behaviours—that involves the infliction of physical or psychological suffering on a non-consenting person. In addition, in order for Coercive Sexual Sadism Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Coercive Sexual Sadism Disorder specifically excludes consensual sexual sadism and masochism.

**6D34****Frotteuristic disorder**

Frotteuristic disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—that involves touching or rubbing against a non-consenting person in crowded public places. In addition, in order for Frotteuristic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Frotteuristic Disorder specifically excludes consensual touching or rubbing that occurs with the consent of the person or persons involved.

**6D35****Other paraphilic disorder involving non-consenting individuals**

Other paraphilic disorder involving non-consenting individuals is characterised by a persistent and intense pattern of atypical sexual arousal — manifested by sexual thoughts, fantasies, urges, or behaviours — in which the focus of the arousal pattern involves others who are unwilling or unable to consent but that is not specifically described in any of the other named Paraphilic Disorders categories (e.g., arousal patterns involving corpses or animals). The individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. The disorder specifically excludes sexual behaviours that occur with the consent of the person or persons involved, provided that they are considered able to provide such consent.

**6D36**

### **Paraphilic disorder involving solitary behaviour or consenting individuals**

Paraphilic disorder involving solitary behaviour or consenting individuals is characterised by a persistent and intense pattern of atypical sexual arousal — manifested by sexual thoughts, fantasies, urges, or behaviours — that involves consenting adults or solitary behaviours. One of the following two elements must be present: 1) the person is markedly distressed by the nature of the arousal pattern and the distress is not simply a consequence of rejection or feared rejection of the arousal pattern by others; or 2) the nature of the paraphilic behaviour involves significant risk of injury or death either to the individual or to the partner (e.g., asphyxophilia).

**6D3Z**

### **Paraphilic disorders, unspecified**

## **Factitious disorders (6D50-6D5Z)**

Factitious disorders are characterised by intentionally feigning, falsifying, inducing, or aggravating medical, psychological, or behavioural signs and symptoms or injury in oneself or in another person, most commonly a child dependent, associated with identified deception. A pre-existing disorder or disease may be present, but the individual intentionally aggravates existing symptoms or falsifies or induces additional symptoms. Individuals with factitious disorder seek treatment or otherwise present themselves or another person as ill, injured, or impaired based on the feigned, falsified, or self-induced signs, symptoms, or injuries. The deceptive behaviour is not solely motivated by obvious external rewards or incentives (e.g., obtaining disability payments or evading criminal prosecution). This is in contrast to Malingering, in which obvious external rewards or incentives motivate the behaviour.

**Exclusions:** Malingering (QC30)

**6D50**

### **Factitious disorder imposed on self**

Factitious disorder imposed on self is characterised by feigning, falsifying, or inducing medical, psychological, or behavioural signs and symptoms or injury associated with identified deception. If a pre-existing disorder or disease is present, the individual intentionally aggravates existing symptoms or falsifies or induces additional symptoms. The individual seeks treatment or otherwise presents himself or herself as ill, injured, or impaired based on the feigned, falsified, or self-induced signs, symptoms, or injuries. The deceptive behaviour is not solely motivated by obvious external rewards or incentives (e.g., obtaining disability payments or evading criminal prosecution). This is in contrast to Malingering, in which obvious external rewards or incentives motivate the behaviour

**Inclusions:** Münchhausen syndrome

**Exclusions:** Excoriation disorder (6B25.1)

Malingering (QC30)

**6D51****Factitious disorder imposed on another**

Factitious disorder imposed on another is characterised by feigning, falsifying, or inducing medical, psychological, or behavioural signs and symptoms or injury in another person, most commonly a child dependent, associated with identified deception. If a pre-existing disorder or disease is present in the other person, the individual intentionally aggravates existing symptoms or falsifies or induces additional symptoms. The individual seeks treatment for the other person or otherwise presents him or her as ill, injured, or impaired based on the feigned, falsified, or induced signs, symptoms, or injuries. The deceptive behaviour is not solely motivated by obvious external rewards or incentives (e.g., obtaining disability payments or avoiding criminal prosecution for child or elder abuse).

**Coding Note:**

The diagnosis of Factitious Disorder Imposed on Another is assigned to the individual who is feigning, falsifying or inducing the symptoms in another person, not to the person who is presented as having the symptoms. Occasionally the individual induces or falsifies symptoms in a pet rather than in another person.

**Exclusions:** Malingering (QC30)

**6D5Z****Factitious disorders, unspecified****Neurocognitive disorders (6D70-6E0Z)**

Neurocognitive disorders are characterised by primary clinical deficits in cognitive functioning that are acquired rather than developmental. That is, neurocognitive disorders do not include disorders characterised by deficits in cognitive function that are present from birth or that typically arise during the developmental period, which are classified in the grouping neurodevelopmental disorders. Rather, neurocognitive disorders represent a decline from a previously attained level of functioning. Although cognitive deficits are present in many mental disorders (e.g., schizophrenia, bipolar disorders), only disorders whose core features are cognitive are included in the neurocognitive disorders grouping. In cases where the underlying pathology and aetiology for neurocognitive disorders can be determined, the identified etiology should be classified separately.

**Exclusions:** Neurodevelopmental disorders (6A00-6A0Z)

**Coded Elsewhere:** Secondary neurocognitive syndrome (6E67)

**6D70****Delirium**

Delirium is characterized by a disturbance of attention, orientation, and awareness that develops within a short period of time, typically presenting as significant confusion or global neurocognitive impairment, with transient symptoms that may fluctuate depending on the underlying causal condition or etiology. Delirium often includes disturbance of behaviour and emotion, and may include impairment in multiple cognitive domains. A disturbance of the sleep-wake cycle, including reduced arousal of acute onset or total sleep loss with reversal of the sleep-wake cycle, may also be present. Delirium may be caused by the direct physiological effects of a medical condition not classified under mental, behavioural or neurodevelopmental disorders, by the direct physiological effects of a substance or medication, including withdrawal, or by multiple or unknown etiological factors.

<b>6D70.0</b>	<b>Delirium due to disease classified elsewhere</b> All definitional requirements for delirium are met. There is evidence from history, physical examination, or laboratory findings that Delirium is caused by the direct physiological consequences of a disorder or disease classified elsewhere.
<b>Coding Note:</b>	Identified etiology should be classified separately.
<b>6D70.1</b>	<b>Delirium due to psychoactive substances including medications</b> All definitional requirements for delirium are met. There is evidence from history, physical examination, or laboratory findings that the delirium is caused by the direct physiological effects of a substance or medication (including withdrawal). If the specific substance inducing the delirium has been identified, it should be classified using the appropriate subcategory (e.g., alcohol-induced delirium).
<b>Coded Elsewhere:</b>	Alcohol-induced delirium (6C40.5) <ul style="list-style-type: none"> <li>Cannabis-induced delirium (6C41.5)</li> <li>Synthetic cannabinoid-induced delirium (6C42.5)</li> <li>Opioid-induced delirium (6C43.5)</li> <li>Sedative, hypnotic or anxiolytic-induced delirium (6C44.5)</li> <li>Cocaine-induced delirium (6C45.5)</li> <li>Stimulant-induced delirium including amphetamines, methamphetamine or methcathinone (6C46.5)</li> <li>Synthetic cathinone-induced delirium (6C47.5)</li> <li>Hallucinogen-induced delirium (6C49.4)</li> <li>Volatile inhalant-induced delirium (6C4B.5)</li> <li>MDMA or related drug-induced delirium, including MDA (6C4C.5)</li> <li>Dissociative drug-induced delirium including ketamine or PCP (6C4D.4)</li> <li>Delirium induced by other specified psychoactive substance including medications (6C4E.5)</li> <li>Delirium induced by multiple specified psychoactive substances including medications (6C4F.5)</li> <li>Delirium induced by unknown or unspecified psychoactive substance (6C4G.5)</li> </ul>
<b>6D70.2</b>	<b>Delirium due to multiple etiological factors</b> All definitional requirements for delirium are met. There is evidence from history, physical examination, or laboratory findings that the delirium is attributable to multiple etiological factors, which may include disorders or diseases not classified under mental and behavioural disorders, substance intoxication or withdrawal, or a medication.
<b>Coding Note:</b>	Identified etiologies should be classified separately.
<b>6D70.Y</b>	<b>Delirium, other specified cause</b>
<b>6D70.Z</b>	<b>Delirium, unspecified or unknown cause</b>

**6D71****Mild neurocognitive disorder**

Mild neurocognitive disorder is characterized by mild impairment in one or more cognitive domains relative to that expected given the individual's age and general premorbid level of cognitive functioning, which represents a decline from the individual's previous level of functioning. Diagnosis is based on report from the patient, informant, or clinical observation, and is accompanied by objective evidence of impairment by quantified clinical assessment or standardized cognitive testing. Cognitive impairment is not severe enough to significantly interfere with an individual's ability to perform activities related to personal, family, social, educational, and/or occupational functioning or other important functional areas. Cognitive impairment is not attributable to normal aging and may be static, progressive, or may resolve or improve depending on underlying cause or treatment. Cognitive impairment may be attributable to an underlying acquired disease of the nervous system, a trauma, an infection or other disease process affecting the brain, use of specific substances or medications, nutritional deficiency or exposure to toxins, or the etiology may be undetermined. The impairment is not due to current substance intoxication or withdrawal.

**Coding Note:**

Code also the causing condition

**6D72****Amnestic disorder**

Amnestic disorder is characterised by prominent memory impairment relative to expectations for age and general premorbid level of cognitive functioning, which represents a decline from the individual's previous level of functioning, in the absence of other significant cognitive impairment. It is manifested by a deficit in acquiring, learning, and/or retaining new information, and may include the inability to recall previously learned information, without disturbance of consciousness, altered mental status, or delirium. Recent memory is typically more disturbed than remote memory, and the ability to immediately recall a limited amount of information is usually relatively preserved. The memory impairment is severe enough to result in significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. It is presumed to be attributable to an underlying acquired disease of the nervous system, a trauma, an infection or other disease process affecting the brain, to use of specific substances or medications, nutritional deficiency or exposure to toxins, or the etiology may be undetermined. The impairment is not due to current substance intoxication or withdrawal.

**Exclusions:**

Delirium (6D70)

Dementia (6D80-6D8Z)

Mild neurocognitive disorder (6D71)

<b>6D72.0</b>	<b>Amnestic disorder due to diseases classified elsewhere</b> All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct pathophysiological consequence of a medical condition not classified under mental, behavioural and neurodevelopmental disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not better explained by Delirium, Dementia, another mental disorder (e.g., Schizophrenia or Other Primary Psychotic Disorder, a Mood Disorder) or the effects of a medication or substance, including withdrawal effects. The symptoms are sufficiently severe to be a specific focus of clinical attention. The identified etiological medical condition should be classified separately.
<b>Coding Note:</b>	Code also the causing condition

The memory impairment may develop during or soon after alcohol intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of the alcohol use.
<b>Coding Note:</b>	This category should not be used to describe cognitive changes due to thiamine deficiency associated with chronic alcohol use.
	<b>Exclusions:</b> Korsakoff syndrome (5B5A.11) Wernicke-Korsakoff Syndrome (5B5A.1)

- 6D72.11** Amnestic disorder due to use of sedatives, hypnotics or anxiolytics  
All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct consequence of use of sedatives, hypnotics or anxiolytics. The intensity and duration of use of sedatives, hypnotics or anxiolytics must be known to be capable of producing memory impairment. The memory impairment may develop during or soon after sedative, hypnotic or anxiolytic intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of use of sedatives, hypnotics or anxiolytics.
- Coding Note:** Code also the causing condition
- 6D72.12** Amnestic disorder due to other specified psychoactive substance including medications  
All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct consequence of use of a specified psychoactive substance other than alcohol; sedatives, hypnotics or anxiolytics; or volatile inhalants. The intensity and duration of use of the specified psychoactive substance must be known to be capable of producing memory impairment. The memory impairment may develop during or soon after specified psychoactive substance intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of the specified psychoactive substance.
- 6D72.13** Amnestic disorder due to use of volatile inhalants  
All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct consequence of use of volatile inhalants. The intensity and duration of use of volatile inhalants must be known to be capable of producing memory impairment. The memory impairment may develop during or soon after volatile inhalant intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of use of volatile inhalants.
- 6D72.Y** **Amnestic disorder, other specified cause**
- 6D72.Z** **Amnestic disorder, unknown or unspecified cause**

## Dementia (6D80-6D8Z)

Dementia is characterized by the presence of marked impairment in two or more cognitive domains relative to that expected given the individual's age and general premorbid level of cognitive functioning, which represents a decline from the individual's previous level of functioning. Memory impairment is present in most forms of dementia, but cognitive impairment is not restricted to memory (i.e., there is impairment in other areas such as executive functions, attention, language, social cognition and judgment, psychomotor speed, visuoperceptual or visuospatial abilities). Neurobehavioural changes may also be present and, in some forms of dementia, may be the presenting symptom. Cognitive impairment is not attributable to normal aging and is severe enough to significantly interfere with independence in an individual's performance of activities of daily living. The cognitive impairment is presumed to be attributable to an underlying acquired disease of the nervous system, a trauma, an infection or other disease process affecting the brain, or to use of specific substances or medications, nutritional deficiency or exposure to toxins, or the etiology may be undetermined. The impairment is not due to current substance intoxication or withdrawal.

**Coding Note:** This category should only be used for primary tabulation, if the aetiology of the dementia is unknown. If the aetiology of the dementia is known code to the aetiology of the dementia for primary tabulation.

When dementia is due to multiple aetiologies, code all that apply.

**Inclusions:** Dementia NOS

Delirium (6D70)

Disorders of intellectual development (6A00)

Neurodevelopmental disorders (6A00-6A0Z)

Stupor (MB20.0)

Ageing associated decline in intrinsic capacity (MG2A)

## 6D80

### Dementia due to Alzheimer disease

Dementia due to Alzheimer disease is the most common form of dementia. Onset is insidious with memory impairment typically reported as the initial presenting complaint. The characteristic course is a slow but steady decline from a previous level of cognitive functioning with impairment in additional cognitive domains (such as executive functions, attention, language, social cognition and judgment, psychomotor speed, visuoperceptual or visuospatial abilities) emerging with disease progression. Dementia due to Alzheimer disease may be accompanied by mental and behavioural symptoms such as depressed mood and apathy in the initial stages of the disease and may be accompanied by psychotic symptoms, irritability, aggression, confusion, abnormalities of gait and mobility, and seizures at later stages. Positive genetic testing, family history and gradual cognitive decline are suggestive of Dementia due to Alzheimer disease.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

<b>6D80.0</b>	<b>Dementia due to Alzheimer disease with early onset</b> Dementia due to Alzheimer disease in which symptoms emerge before the age of 65 years. It is relatively rare, representing less than 5% of all cases, and may be genetically determined (autosomal dominant Alzheimer disease). Clinical presentation may be similar to cases with later onset, but progression of cognitive deficits may be more rapid.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
<b>6D80.1</b>	<b>Dementia due to Alzheimer disease with late onset</b> Dementia due to Alzheimer disease that develops at the age of 65 years or above. This is the most common pattern, representing more than 95% of all cases.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
<b>6D80.2</b>	<b>Alzheimer disease dementia, mixed type, with cerebrovascular disease</b> Dementia due to Alzheimer disease and concomitant cerebrovascular disease.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
<b>6D80.3</b>	<b>Alzheimer disease dementia, mixed type, with other nonvascular aetiologies</b> Dementia due to Alzheimer disease with other concomitant pathology, not including cerebrovascular disease.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
<b>6D80.Z</b>	<b>Dementia due to Alzheimer disease, onset unknown or unspecified</b> This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

**6D81****Dementia due to cerebrovascular disease**

Dementia due to brain parenchyma injury resulting from cerebrovascular disease (ischemic or haemorrhagic). The onset of the cognitive deficits is temporally related to one or more vascular events. Cognitive decline is typically most prominent in speed of information processing, complex attention, and frontal-executive functioning. There is evidence of the presence of cerebrovascular disease considered to be sufficient to account for the neurocognitive deficits from history, physical examination and neuroimaging.

**Coding Note:**

This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

**Exclusions:**      Alzheimer disease dementia, mixed type, with cerebrovascular disease (6D80.2)

**6D82****Dementia due to Lewy body disease**

Dementia preceding or occurring within one year after the onset of motor parkinsonian signs in the setting of Lewy body disease. Characterized by presence of Lewy bodies, which are intraneuronal inclusions containing  $\alpha$ -synuclein and ubiquitin in the brain stem, limbic area, forebrain, and neocortex. Onset is insidious with attentional and executive functioning deficits often present. These cognitive deficits are often accompanied by visual hallucinations and symptoms of REM sleep behaviour disorder. Hallucinations in other sensory modalities, depressive symptoms, and delusions may also be present. The symptom presentation usually varies significantly over the course of days necessitating longitudinal assessment and differentiation from delirium. Spontaneous onset of Parkinsonism within approximately 1 year of the onset of cognitive symptoms is common.

**Coding Note:**

This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D83****Frontotemporal dementia**

Frontotemporal dementia (FTD) is a group of primary neurodegenerative disorders primarily affecting the frontal and temporal lobes. Onset is typically insidious with a gradual and worsening course. Several syndromic variants (some with an identified genetic basis or familiality) are described that include presentations with predominantly marked personality and behavioral changes (such as executive dysfunction, apathy, deterioration of social cognition, repetitive behaviours, and dietary changes), predominantly language deficits (that include semantic, agrammatic/nonfluent, and logopenic forms), predominantly movement-related deficits (progressive supranuclear palsy, corticobasal degeneration, multiple systems atrophy, or amyotrophic lateral sclerosis), or a combination of these deficits. Memory function often remains relatively intact, particularly during the early stages of the disorder.

**Coding Note:**

This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D84**

**Dementia due to psychoactive substances including medications**

Dementia due to psychoactive substances including medications includes forms of dementia that are judged to be a direct consequence of substance use and that persist beyond the usual duration of action or withdrawal syndrome associated with the substance. The amount and duration of substance use must be sufficient to produce the cognitive impairment. The cognitive impairment is not better accounted for by a disorder that is not induced by substances such as a dementia due to another medical condition.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**Inclusions:** Dementia due to exposure to heavy metals and other toxins  
(6D85.2)

**6D84.0**

**Dementia due to use of alcohol**

Dementia due to use of alcohol is characterised by the development of persistent cognitive impairments (e.g., memory problems, language impairment, and an inability to perform complex motor tasks) that meet the definitional requirements of Dementia that are judged to be a direct consequence of alcohol use and that persist beyond the usual duration of alcohol intoxication or acute withdrawal. The intensity and duration of alcohol use must have been sufficient to produce the cognitive impairment. The cognitive impairment is not better accounted for by a disorder or disease that is not induced by alcohol such as a dementia due to another disorder or disease classified elsewhere.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

This category should not be used to describe cognitive changes due to thiamine deficiency associated with chronic alcohol use.

**Inclusions:** Alcohol-induced dementia

**Exclusions:** Wernicke-Korsakoff Syndrome (5B5A.1)  
Korsakoff syndrome (5B5A.11)

<b>6D84.1</b>	<b>Dementia due to use of sedatives, hypnotics or anxiolytics</b> Dementia due to use of sedatives, hypnotics or anxiolytics is characterised by the development of persistent cognitive impairments (e.g., memory problems, language impairment, and an inability to perform complex motor tasks) that meet the definitional requirements of Dementia that are judged to be a direct consequence of sedative, hypnotic, or anxiolytic use and that persist beyond the usual duration of action or withdrawal syndrome associated with the substance. The amount and duration of sedative, hypnotic, or anxiolytic use must be sufficient to produce the cognitive impairment. The cognitive impairment is not better accounted for by a disorder that is not induced by sedatives, hypnotics, or anxiolytics such as a dementia due to another medical condition.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
	<b>Inclusions:</b> Late-onset psychoactive substance-induced psychotic disorder
<b>6D84.2</b>	<b>Dementia due to use of volatile inhalants</b> Dementia due to use of volatile inhalants is characterised by the development of persistent cognitive impairments (e.g., memory problems, language impairment, and an inability to perform complex motor tasks) that meet the definitional requirements of Dementia that are judged to be a direct consequence of inhalant use or exposure and that persist beyond the usual duration of action or withdrawal syndrome associated with the substance. The amount and duration of inhalant use or exposure must be sufficient to be capable of producing the cognitive impairment. The cognitive impairment is not better accounted for by a disorder that is not induced by volatile inhalants such as a dementia due to another medical condition.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
<b>6D84.Y</b>	<b>Dementia due to other specified psychoactive substance</b> This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
<b>6D85</b>	<b>Dementia due to diseases classified elsewhere</b> This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.

6D85.0	<b>Dementia due to Parkinson disease</b>
	Dementia due to Parkinson disease develops among individuals with idiopathic Parkinson disease and is characterized by impairment in attention, memory, executive and visuo-spatial functions. Mental and behavioral symptoms such as changes in affect, apathy and hallucinations may also be present. Onset is insidious and the course is one of gradual worsening of symptoms.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.
	When dementia is due to multiple aetiologies, code all that apply.
6D85.1	<b>Dementia due to Huntington disease</b>
	Dementia due to Huntington disease occurs as part of a widespread degeneration of the brain due to a trinucleotide repeat expansion in the HTT gene, which is transmitted through autosomal dominance. Onset of symptoms is insidious typically in the third and fourth decade of life with gradual and slow progression. Initial symptoms typically include impairments in executive functions with relative sparing of memory, prior to the onset of motor deficits (bradykinesia and chorea) characteristic of Huntington disease.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.
	When dementia is due to multiple aetiologies, code all that apply.
	<b>Inclusions:</b> Dementia in Huntington chorea
6D85.2	<b>Dementia due to exposure to heavy metals and other toxins</b>
	Dementia due to exposure to heavy metals and other toxins caused by toxic exposure to specific heavy metals such as aluminium from dialysis water, lead, mercury or manganese. The characteristic cognitive impairments in Dementia due to exposure to heavy metals and other toxins depend on the specific heavy metal or toxin that the individual has been exposed to but can affect any cognitive domain. Onset of symptoms is related to exposure and progression can be rapid especially with acute exposure. In many cases, symptoms are reversible when exposure is identified and ceases. Investigations such as brain imaging or neurophysiological testing may be abnormal. Lead poisoning is associated with abnormalities on brain imaging including widespread calcification and increased signal on MRI T2-weighted images of periventricular white matter, basal ganglia hypothalamus and pons. Dementia due to aluminium toxicity may demonstrate characteristic paroxysmal high-voltage delta EEG changes. Examination may make evident other features such as peripheral neuropathy in the case of lead, arsenic, or mercury.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.
	When dementia is due to multiple aetiologies, code all that apply.
	<b>Exclusions:</b> Dementia due to psychoactive substances including medications (6D84)

<b>6D85.3</b>	<b>Dementia due to human immunodeficiency virus</b> Dementia due to human immunodeficiency virus develops during the course of confirmed HIV disease, in the absence of a concurrent illness or condition other than HIV infection that could explain the clinical features. Although a variety of patterns of cognitive deficit are possible depending on where the HIV pathogenic processes have occurred, typically deficits follow a subcortical pattern with impairments in executive function, processing speed, attention, and learning new information. The course of Dementia due to human immunodeficiency virus varies including resolution of symptoms, gradual decline in functioning, improvement, or fluctuation in symptoms. Rapid decline in cognitive functioning is rare with the advent of antiretroviral medications.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
<b>6D85.4</b>	<b>Dementia due to multiple sclerosis</b> Dementia due to multiple sclerosis is a neurodegenerative disease due to the cerebral effects of multiple sclerosis, a demyelinating disease. Onset of symptoms is insidious and not secondary to the functional impairment attributable to the primary disease (i.e., multiple sclerosis). Cognitive impairments vary according to the location of demyelination but typically include deficits in processing speed, memory, attention, and aspects of executive functioning.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
<b>6D85.5</b>	<b>Dementia due to prion disease</b> Dementia due to prion disease is a primary neurodegenerative disease caused by a group of spongiform encephalopathies resulting from abnormal prion protein accumulation in the brain. These can be sporadic, genetic (caused by mutations in the prion-protein gene), or transmissible (acquired from an infected individual). Onset is insidious and there is a rapid progression of symptoms and impairment characterised by cognitive deficits, ataxia, and motor symptoms (myoclonus, chorea, or dystonia). Diagnosis is typically made on the basis of brain imaging studies, presence of characteristic proteins in spinal fluid, EEG, or genetic testing.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.

<b>6D85.6</b>	<b>Dementia due to normal pressure hydrocephalus</b> Dementia due to normal pressure hydrocephalus results from excess accumulation of cerebrospinal fluid in the brain as a result of idiopathic, non-obstructive causes but can also be secondary to haemorrhage, infection or inflammation. Progression is gradual but intervention (e.g., shunt) may result in improvement of symptoms, especially if administered earlier in the course of the condition. Typically, cognitive impairments include reduced processing speed and deficits in executive functioning and attention. These symptoms are also typically accompanied by gait abnormalities and urinary incontinence. Brain imaging to reveal ventricular volume and characterize brain displacement is often necessary to confirm the diagnosis.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
<b>6D85.7</b>	<b>Dementia due to injury to the head</b> Dementia due to injury to the head is caused by damage inflicted on the tissues of the brain as the direct or indirect result of an external force. Trauma to the brain is known to have resulted in loss of consciousness, amnesia, disorientation and confusion, or neurological signs. The symptoms characteristic of Dementia due to injury to the head must arise immediately following the trauma or after the individual gains consciousness and must persist beyond the acute post-injury period. Cognitive deficits vary depending on the specific brain areas affected and the severity of the injury but can include impairments in attention, memory, executive functioning, personality, processing speed, social cognition, and language abilities.
<b>Coding Note:</b>	This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
<b>6D85.8</b>	<b>Dementia due to pellagra</b> Dementia due to pellagra is caused by persistent lack of vitamin B3 (niacin) or tryptophan either in the diet or due to poor absorption in the gastrointestinal tract due to disease (e.g., Crohn disease) or due to the effects of some medications (e.g., isoniazid). Core signs of pellagra include dermatological changes (sensitivity to sunlight, lesions, alopecia, and oedema) and diarrhoea. With prolonged nutritional deficiency cognitive symptoms that include aggressivity, motor disturbances (ataxia and restlessness), confusion, and weakness are observed. Treatment with nutritional supplementation (e.g., niacin) typically results in reversal of symptoms.
<b>Coding Note:</b>	Code also the causing condition

6D85.9	<b>Dementia due to Down syndrome</b> Dementia due to Down syndrome is a neurodegenerative disorder related to the impact of abnormal increased production and accumulation of amyloid precursor protein (APP) leading to formation of beta-amyloid plaques and tau tangles. APP gene expression is increased due to its location on chromosome 21, which is abnormally triplicated in Down syndrome. Cognitive deficits and neuropathological features are similar to those observed in Alzheimer disease. Onset is typically after the fourth decade of life with a gradual decline in functioning, and may impact 50% or more of individuals with Down syndrome.
	<b>Coding Note:</b> This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
6D85.Y	<b>Dementia due to other specified diseases classified elsewhere</b>
	<b>Coding Note:</b> This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.  When dementia is due to multiple aetiologies, code all that apply.
6D86	<b>Behavioural or psychological disturbances in dementia</b> In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant behavioural or psychological disturbances.
	<b>Coding Note:</b> These categories should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of behavioural or psychological disturbance in dementia.  Code all that apply.
	<b>Exclusions:</b> Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere (6E60-6E6Z)
6D86.0	<b>Psychotic symptoms in dementia</b> In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant delusions or hallucinations.
	<b>Exclusions:</b> Schizophrenia or other primary psychotic disorders (6A20-6A2Z)  Secondary psychotic syndrome (6E61)
6D86.1	<b>Mood symptoms in dementia</b> In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant mood symptoms such as depressed mood, elevated mood, or irritable mood.
	<b>Exclusions:</b> Mood disorders (6A60-6A8Z)  Secondary mood syndrome (6E62)

- 6D86.2 Anxiety symptoms in dementia**  
In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant symptoms of anxiety or worry.
- Exclusions:**
- Anxiety or fear-related disorders (6B00-6B0Z)
  - Secondary anxiety syndrome (6E63)
- 6D86.3 Apathy in dementia**  
In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant indifference or lack of interest.
- Exclusions:**
- Mood disorders (6A60-6A8Z)
  - Secondary mood syndrome (6E62)
- 6D86.4 Agitation or aggression in dementia**  
In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes: 1) clinically significant excessive psychomotor activity accompanied by increased tension; or 2) hostile or violent behaviour.
- 6D86.5 Disinhibition in dementia**  
In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant lack of restraint manifested in disregard for social conventions, impulsivity, and poor risk assessment.
- 6D86.6 Wandering in dementia**  
In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant wandering that puts the person at risk of harm.
- 6D86.Y Other specified behavioural or psychological disturbances in dementia**
- Coding Note:** These categories should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of behavioural or psychological disturbance in dementia.  
Code all that apply.
- 6D86.Z Behavioural or psychological disturbances in dementia, unspecified**
- Coding Note:** These categories should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of behavioural or psychological disturbance in dementia.  
Code all that apply.
- 6D8Y Dementia, other specified cause**
- Coding Note:** This category should only be used for primary tabulation, if the aetiology of the dementia is unknown. If the aetiology of the dementia is known code to the aetiology of the dementia for primary tabulation.  
When dementia is due to multiple aetiologies, code all that apply.

**6D8Z****Dementia, unknown or unspecified cause****Coding Note:**

This category should only be used for primary tabulation, if the aetiology of the dementia is unknown. If the aetiology of the dementia is known code to the aetiology of the dementia for primary tabulation.

When dementia is due to multiple aetiologies, code all that apply.

**6E0Y****Other specified neurocognitive disorders****6E0Z****Neurocognitive disorders, unspecified**

Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium (6E20-6E2Z)

Syndromes associated with pregnancy or the puerperium (commencing within about 6 weeks after delivery) that involve significant mental and behavioural features. If the symptoms meet the diagnostic requirements for a specific mental disorder, that diagnosis should also be assigned.

**Coded Elsewhere:** Psychological disorder related to obstetric fistula (GC04.1Y)

**6E20****Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, without psychotic symptoms**

A syndrome associated with pregnancy or the puerperium (commencing within about 6 weeks after delivery) that involves significant mental and behavioural features, most commonly depressive symptoms. The syndrome does not include delusions, hallucinations, or other psychotic symptoms. If the symptoms meet the diagnostic requirements for a specific mental disorder, that diagnosis should also be assigned. This designation should not be used to describe mild and transient depressive symptoms that do not meet the diagnostic requirements for a depressive episode, which may occur soon after delivery (so-called postpartum blues).

**Coding Note:**

Code also the causing condition

**6E21****Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, with psychotic symptoms**

A syndrome associated with pregnancy or the puerperium (commencing within about 6 weeks after delivery) that involves significant mental and behavioural features, including delusions, hallucinations, or other psychotic symptoms. Mood symptoms (depressive and/or manic) are also typically present. If the symptoms meet the diagnostic requirements for a specific mental disorder, that diagnosis should also be assigned.

**Coding Note:**

Code also the causing condition

**6E2Z****Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, unspecified**

**6E40**

**Psychological or behavioural factors affecting disorders or diseases classified elsewhere**

Psychological and behavioural factors affecting disorders or diseases classified elsewhere are those that may adversely affect the manifestation, treatment, or course of a condition classified in another chapter of the ICD. These factors may adversely affect the manifestation, treatment, or course of the disorder or disease classified in another chapter by: interfering with the treatment of the disorder or disease by affecting treatment adherence or care seeking; constituting an additional health risk; or influencing the underlying pathophysiology to precipitate or exacerbate symptoms or otherwise necessitate medical attention. This diagnosis should be assigned only when the factors increase the risk of suffering, disability, or death and represent a focus of clinical attention, and should be assigned together with the diagnosis for the relevant other condition.

**Inclusions:** Psychological factors affecting physical conditions

**Exclusions:** Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium (6E20-6E2Z)

**6E40.0**

**Mental disorder affecting disorders or diseases classified elsewhere**

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual is diagnosed with a mental, behavioural, or neurodevelopmental disorder that adversely affects the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., a woman with Bulimia Nervosa and Type 1 diabetes mellitus who skips insulin doses as a way to avoid weight gain that would otherwise be caused by her binge eating).

**6E40.1**

**Psychological symptoms affecting disorders or diseases classified elsewhere**

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual exhibits psychological symptoms that do not meet the diagnostic requirements for a mental, behavioural, or neurodevelopmental disorder that adversely affect the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., depressive symptoms interfering with rehabilitation following surgery).

**6E40.2**

**Personality traits or coping style affecting disorders or diseases classified elsewhere**

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual exhibits personality traits or coping styles that do not meet the diagnostic requirements for a mental, behavioural, or neurodevelopmental disorder that adversely affect the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., pathological denial of the need for surgery in a patient with cancer; hostile, pressured behaviour contributing to heart disease).

- 6E40.3 Maladaptive health behaviours affecting disorders or diseases classified elsewhere**  
All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual exhibits maladaptive health behaviours that adversely affect the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., overeating, lack of exercise).
- 6E40.4 Stress-related physiological response affecting disorders or diseases classified elsewhere**  
All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual exhibits stress-related physiological responses that adversely affect the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., stress-related exacerbation of ulcer, hypertension, arrhythmia, or tension headache).
- 6E40.Y Other specified psychological or behavioural factors affecting disorders or diseases classified elsewhere**
- 6E40.Z Psychological or behavioural factors affecting disorders or diseases classified elsewhere, unspecified**

## Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere (6E60-6E6Z)

This grouping includes syndromes characterised by the presence of prominent psychological or behavioural symptoms judged to be direct pathophysiological consequences of a medical condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., adjustment disorder or anxiety symptoms in response to being diagnosed with a life-threatening illness). These categories should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychological and behavioural symptoms are sufficiently severe to warrant specific clinical attention.

- Exclusions:**
- Acute pain (MG31)
  - Bodily distress disorder (6C20)
  - Chronic pain (MG30)

**Coded Elsewhere:** Delirium due to disease classified elsewhere (6D70.0)

**6E60**

### Secondary neurodevelopmental syndrome

A syndrome that involves significant neurodevelopmental features that do not fulfill the diagnostic requirements of any of the specific neurodevelopmental disorders that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders (e.g., autistic-like features in Rett syndrome; aggression and self-mutilation in Lesch-Nyhan syndrome, abnormalities in language development in Williams syndrome), based on evidence from the history, physical examination, or laboratory findings.

This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the neurodevelopmental problems are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

- Exclusions:**
- Autism spectrum disorder (6A02)
  - Disorders of intellectual development (6A00)
  - Stereotyped movement disorder (6A06)

**6E60.0**

### Secondary speech or language syndrome

A syndrome that involves significant features related to speech or language development that do not fulfill the diagnostic requirements of any of the specific developmental speech or language disorders that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. Possible etiologies include a disease of the nervous system, sensory impairment, brain injury or infection.

**Coding Note:** This diagnosis should be assigned in addition to the diagnosis for the presumed underlying disorder or disease when the neurodevelopmental problems are sufficiently severe to warrant specific clinical attention.

**6E60.Y**

### Other specified secondary neurodevelopmental syndrome

**Coding Note:** Code also the causing condition

**6E60.Z              Secondary neurodevelopmental syndrome, unspecified**

**Coding Note:** Code also the causing condition

**6E61              Secondary psychotic syndrome**

A syndrome characterised by the presence of prominent hallucinations or delusions judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:**        Acute and transient psychotic disorder (6A23)

                        Delirium (6D70)

                        Mood disorders (6A60-6A8Z)

**6E61.0              Secondary psychotic syndrome, with hallucinations**

A syndrome characterised by the presence of prominent hallucinations that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. Delusions are not a prominent aspect of the clinical presentation. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:**        Delirium (6D70)

                        Mood disorders (6A60-6A8Z)

<b>6E61.1</b>	<b>Secondary psychotic syndrome, with delusions</b> A syndrome characterised by the presence of prominent delusions that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. Hallucinations are not a prominent aspect of the clinical presentation. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.
	<b>Coding Note:</b> Code also the causing condition
	<b>Exclusions:</b> Delirium (6D70) Mood disorders (6A60-6A8Z)
<b>6E61.2</b>	<b>Secondary psychotic syndrome, with hallucinations and delusions</b> A syndrome characterised by the presence of both prominent hallucinations and prominent delusions that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.
	<b>Coding Note:</b> Code also the causing condition
	<b>Exclusions:</b> Delirium (6D70) Mood disorders (6A60-6A8Z)
<b>6E61.3</b>	<b>Secondary psychotic syndrome, with unspecified symptoms</b>
	<b>Coding Note:</b> Code also the causing condition
<b>6E62</b>	<b>Secondary mood syndrome</b> A syndrome characterised by the presence of prominent mood symptoms (i.e., depression, elevated mood, irritability) judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., depressive symptoms in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the mood symptoms are sufficiently severe to warrant specific clinical attention.
	<b>Coding Note:</b> Code also the causing condition
	<b>Exclusions:</b> Adjustment disorder (6B43) Delirium (6D70)

6E62.0	<p><b>Secondary mood syndrome, with depressive symptoms</b></p> <p>A syndrome characterised by the presence of prominent depressive symptoms such as persistently depressed mood, loss of interest in previously enjoyable activities, or signs such as tearful and downtrodden appearance that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., depressive symptoms in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the mood symptoms are sufficiently severe to warrant specific clinical attention.</p>

**6E62.2**

**Secondary mood syndrome, with mixed symptoms**

A syndrome characterised by the presence of both manic and depressive symptoms, either occurring together or alternating from day to day or over the course of a day that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders based on evidence from the history, physical examination, or laboratory findings. Manic symptoms may include elevated, euphoric, irritable, or expansive mood states, rapid changes among different mood states (i.e., mood lability), or increased energy or activity. Depressive symptoms may include persistently depressed mood, loss of interest in previously enjoyable activities, or signs such as tearful or downtrodden appearance. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., depressive symptoms in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the mood symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:**

Code also the causing condition

**Exclusions:**

Adjustment disorder (6B43)

Delirium (6D70)

**6E62.3**

**Secondary mood syndrome, with unspecified symptoms**

**Coding Note:**

Code also the causing condition

**Exclusions:**

Adjustment disorder (6B43)

Delirium (6D70)

**6E63**

**Secondary anxiety syndrome**

A syndrome characterised by the presence of prominent anxiety symptoms judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., anxiety symptoms or panic attacks in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the anxiety symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:**

Code also the causing condition

**Exclusions:**

Adjustment disorder (6B43)

Delirium (6D70)

**6E64**

### **Secondary obsessive-compulsive or related syndrome**

A syndrome characterised by the presence of prominent obsessions, compulsions, hoarding, skin picking, hair pulling, other body-focused repetitive behaviours, or other symptoms characteristic of obsessive-compulsive and related disorder that is judged to be the direct pathophysiological consequence of a disorder or disease not classified under Mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by Delirium or by another Mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., repetitive ruminations in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the obsessive-compulsive or related symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:**

Code also the causing condition

**Exclusions:**

Delirium (6D70)

Obsessive-compulsive or related disorder induced by other specified psychoactive substance (6C4E.72)

Tic disorders (8A05)

**6E65**

### **Secondary dissociative syndrome**

A syndrome characterised by the presence of prominent dissociative symptoms (e.g., depersonalization, derealization) that is judged to be the direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., as part of an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the dissociative symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:**

Code also the causing condition

**Exclusions:**

Delirium (6D70)

Acute stress reaction (QE84)

**6E66**

### **Secondary impulse control syndrome**

A syndrome characterised by the presence of prominent symptoms that are characteristic of Impulse Control Disorders or Disorders Due to Addictive Behaviours (e.g., stealing, fire-setting, aggressive outbursts, compulsive sexual behaviour, excessive gambling) that are judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., as part of an adjustment disorder in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the impulse control symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:**

Code also the causing condition

**Exclusions:** Delirium (6D70)

**6E67**

### **Secondary neurocognitive syndrome**

A syndrome that involves significant cognitive features that do not fulfill the diagnostic requirements of any of the specific neurocognitive disorders and are judged to be a direct pathophysiological consequence of a health condition or injury not classified under mental and behavioural disorders (e.g., cognitive changes due to a brain tumour), based on evidence from the history, physical examination, or laboratory findings. This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the cognitive symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:**

Code also the causing condition

**Exclusions:** Disorders with neurocognitive impairment as a major feature (8A20-8A2Z)

**Coded Elsewhere:** Delirium (6D70)

**6E68**

### **Secondary personality change**

A syndrome characterised by a persistent personality disturbance that represents a change from the individual's previous characteristic personality pattern that is judged to be a direct pathophysiological consequence of a health condition not classified under Mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., social withdrawal, avoidance, or dependence in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the personality symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:**

Code also the causing condition

**Exclusions:** Personality difficulty (QE50.7)

Personality disorder (6D10)

Delirium (6D70)

**6E69**

**Secondary catatonia syndrome**

Secondary catatonia syndrome is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abnormal psychomotor activity, which occurs as a direct pathophysiological consequence of a medical condition not classified under Mental, Behavioural or Neurodevelopmental Disorders. Examples of medical conditions that may be associated with Catatonia include diabetic ketoacidosis, hypercalcaemia, hepatic encephalopathy, homocystinuria, neoplasms head trauma, cerebrovascular disease, and encephalitis.

**Coding Note:** Use additional code, if desired, for any underlying disorder if known.

**Mental, behavioural or neurodevelopmental disorders, unspecified**

# **CHAPTER 07**

---

## **Sleep-wake disorders**

This chapter has 42 four-character categories.

Code range starts with 7A00

Sleep-wake disorders are characterised by difficulty initiating or maintaining sleep (insomnia disorders), excessive sleepiness (hypersomnolence disorders), respiratory disturbance during sleep (sleep-related breathing disorders), disorders of the sleep-wake schedule (circadian rhythm sleep-wake disorders), abnormal movements during sleep (sleep-related movement disorders), or problematic behavioural or physiological events that occur while falling asleep, during sleep, or upon arousal from sleep (parasomnia disorders).

This chapter contains the following top level blocks:

- Insomnia disorders
- Hypersomnolence disorders
- Sleep-related breathing disorders
- Circadian rhythm sleep-wake disorders
- Sleep-related movement disorders
- Parasomnia disorders

## **Insomnia disorders (7A00-7A0Z)**

Insomnia disorders are characterised by the complaint of persistent difficulty with sleep initiation, duration, consolidation, or quality that occurs despite adequate opportunity and circumstances for sleep, and results in some form of daytime impairment. Daytime symptoms typically include fatigue, depressed mood or irritability, general malaise, and cognitive impairment. Individuals who report sleep related symptoms in the absence of daytime impairment are not regarded as having an insomnia disorder.

**7A00**

### **Chronic insomnia**

Chronic insomnia is a frequent and persistent difficulty initiating or maintaining sleep that occurs despite adequate opportunity and circumstances for sleep and that results in general sleep dissatisfaction and some form of daytime impairment. Daytime symptoms typically include fatigue, depressed mood or irritability, general malaise, and cognitive impairment. The sleep disturbance and associated daytime symptoms occur at least several times per week for at least 3 months. Some individuals with chronic insomnia may show a more episodic course, with recurrent episodes of sleep/wake difficulties lasting several weeks at a time over several years. Individuals who report sleep related symptoms in the absence of daytime impairment are not regarded as having an insomnia disorder. If the insomnia is due to another sleep-wake disorder, a mental disorder, another medical condition, or a substance or medication, chronic insomnia should only be diagnosed if the insomnia is an independent focus of clinical attention.

**7A01**

### **Short-term insomnia**

Short-term insomnia is characterised by difficulty initiating or maintaining sleep of less than 3 months duration that occurs despite adequate opportunity and circumstances for sleep and results in general sleep dissatisfaction and some form of daytime impairment. Daytime symptoms typically include fatigue, depressed mood or irritability, general malaise, and cognitive impairment. Individuals who report sleep related symptoms in the absence of daytime impairment are not regarded as having an insomnia disorder. If the insomnia is due to another sleep-wake disorder, a mental disorder, another medical condition, or a substance or medication, short-term insomnia should only be diagnosed if the insomnia is an independent focus of clinical attention.

**7A0Z**

### **Insomnia disorders, unspecified**

## Hypersomnolence disorders (7A20-7A2Z)

Hypersomnolence disorders are characterised by a complaint of daytime sleepiness that is not due to another sleep-wake disorder (e.g. disturbed nocturnal sleep, misaligned circadian rhythm, or breathing disorder). Individuals with excessive sleepiness may show irritability, concentration and attention deficits, reduced vigilance, distractibility, reduced motivation, anergia, dysphoria, fatigue, restlessness, and lack of coordination.

**7A20**

### **Narcolepsy**

Narcolepsy is a disorder characterised by daily periods of irrepressible need to sleep or daytime lapses into sleep occurring for at least several months, accompanied by abnormal manifestations of REM sleep. Multiple sleep latency testing (MSLT) demonstrates a mean sleep latency of <8 minutes and two or more sleep-onset REM periods (SOREMP's), or one or more SOREMP's on MSLT and a SOREMP on the preceding overnight polysomnography (PSG). Nighttime sleep is often disturbed, and brief daytime naps are typically refreshing.

**7A20.0**

#### **Narcolepsy, Type 1**

Type 1 narcolepsy is a disorder of excessive sleepiness due to a deficiency of hypothalamic hypocretin (orexin) signaling. In addition to daily periods of irrepressible need to sleep or daytime lapses into sleep, type 1 narcolepsy is characterised by symptoms of REM sleep dissociation, most importantly cataplexy. Cataplexy is a sudden and uncontrollable loss of muscle tone arising during wakefulness that is typically triggered by a strong emotion, such as excitement or laughter. Although cataplexy is a pathognomonic symptom of type 1 narcolepsy, it may not manifest until years following onset of the sleepiness. In such cases, a diagnosis of narcolepsy, type 1 may be made based on cerebrospinal fluid (CSF)-hypocretin levels < 110 picograms per milliliter. Episodes of sleep paralysis and hypnagogic or hypnopompic hallucinations may also be present. The disorder is not attributable to a disease of the nervous system or other medical condition.

Note: A definitive diagnosis requires daily periods of irrepressible need to sleep or daytime lapses into sleep plus either: a) cataplexy and multiple sleep latency test/polysomnography (MSLT/PSG) findings characteristic of narcolepsy; or b) demonstrated CSF hypocretin deficiency.

**7A20.1**

#### **Narcolepsy, Type 2**

Type 2 narcolepsy is a disorder of excessive sleepiness characterised by daily periods of irrepressible need to sleep or daytime lapses into sleep and abnormal manifestations of REM sleep as demonstrated by multiple sleep latency test (MSLT/PSG) findings in the context of normal hypothalamic hypocretin (orexin) signaling. That is, cerebrospinal fluid (CSF) hypocretin determinations are > 110 picograms per milliliter. Cataplexy is not present. The disorder is not attributable to a disease of the nervous system or other medical condition.

Note: A definitive diagnosis requires daily periods of irrepressible need to sleep or daytime lapses into sleep and multiple sleep latency test/polysomnography (MSLT/PSG) findings characteristic of narcolepsy. There should be no evidence of cataplexy or CSF hypocretin deficiency (if testing is performed).

**7A20.Z**

#### **Narcolepsy, unspecified**

**7A21**

### **Idiopathic hypersomnia**

Idiopathic hypersomnia is characterised by daily periods of irrepressible need to sleep or daytime lapses into sleep occurring for at least several months in the absence of cataplexy or hypocretin deficiency (if determined). Polysomnography/multiple sleep latency test (MSLT) findings characteristic of narcolepsy (i.e., two or more sleep-onset REM periods (SOREMP's), or one or more SOREMP's on MSLT and a SOREMP on the preceding overnight polysomnography) should also be absent. The daytime sleepiness is not better explained by another disorder (e.g., insufficient sleep syndrome, obstructive sleep apnoea, circadian rhythm sleep-wake disorder), a substance or medication, or a medical condition). Objective evidence of hypersomnolence is indicated by an MSLT showing a mean sleep latency of ≤ 8 minutes or by polysomnography or wrist actigraphy showing a total 24-hour sleep time of 11 hours or more. Prolonged and severe sleep inertia is often observed and consists of sustained difficulty waking up with repeated returns to sleep, irritability, automatic behaviour, and confusion. In contrast to narcolepsy, naps are generally long, often more than 60 minutes, and unrefreshing.

Note: A definitive diagnosis requires daily periods of irrepressible need to sleep or daytime lapses into sleep, objective demonstration of excessive sleepiness and absence of REM-related findings by multiple sleep latency test (MSLT/PSG).

**7A22**

### **Kleine-Levin syndrome**

Kleine-Levin syndrome is characterised by recurrent episodes of severe sleepiness in association with cognitive, psychiatric, and behavioural disturbances. A typical episode lasts a median of 10 days (range 2.5–80 days), with rare episodes lasting several weeks to months. During episodes, patients may sleep as long as 16 to 20 hours per day, waking or getting up only to eat and void. When awake during episodes, most patients are exhausted, apathetic, confused, and slow in speaking and answering. Hyperphagia, hypersexuality, childish behaviour, depression, anxiety, hallucinations and delusions are often observed during the episodes. Patients are normal between episodes with regard to sleep, cognition, mood, and eating. Rarely, Kleine Levin syndrome may occur exclusively during menstrual periods.

**Inclusions:** recurrent hypersomnolence

**7A23**

### **Hypersomnia due to a medical condition**

Hypersomnia due to a medical condition is characterised by excessive nocturnal sleep, daytime sleepiness, or excessive napping of at least several months duration that is attributable to a coexisting medical or neurological disorder (e.g. head trauma, Parkinson disease, certain genetic conditions, metabolic, neurologic or endocrine disorders) and is sufficiently severe to require an independent focus of clinical attention. Hypersomnia due to a medical condition is only diagnosed if the hypersomnia is a direct physiological consequence of the medical condition. Residual sleepiness in patients with adequately-treated obstructive sleep apnoea is classified here under the assumption that it is due to central nervous system damage from recurrent hypoxemia.

Note: A definitive diagnosis requires use of polysomnography and multiple sleep latency test (MSLT) to rule out other hypersomnolence disorders or other sleep disorders (e.g. obstructive sleep apnea) which might better explain the sleepiness.

**7A24****Hypersomnia due to a medication or substance**

Hypersomnia due to a medication or substance is characterised by excessive nocturnal sleep, daytime sleepiness, or excessive napping that is attributable to the sedating effects of medications, alcohol, or other psychoactive substances, including withdrawal syndromes (e.g., from stimulants) and is sufficiently severe to constitute an independent focus of clinical attention.

Note: A definitive diagnosis requires use of polysomnography and multiple sleep latency test (MSLT) to rule out other hypersomnolence disorders or other sleep disorders (e.g. obstructive sleep apnea) which might better explain the sleepiness.

**Inclusions:** Hypersomnia due to substances including medications

**7A25****Hypersomnia associated with a mental disorder**

Hypersomnia associated with a mental disorder is characterised by excessive nocturnal sleep, daytime sleepiness, or excessive napping that is sufficiently severe to constitute an independent focus of clinical attention. This is most typical of depressive disorders or the depressed phase of bipolar disorders. Patients often feel that their sleep is of poor quality and nonrestorative and may be intensely focused on their hypersomnolence. Objective evidence of excessive sleepiness on MSLT is often absent.

Note: A definitive diagnosis requires use of polysomnography and multiple sleep latency test (MSLT) to rule out other hypersomnolence disorders or other sleep disorders (e.g. obstructive sleep apnea) which might better explain the sleepiness.

**7A26****Insufficient sleep syndrome**

Insufficient sleep syndrome occurs when an individual persistently fails to obtain the amount of sleep required relative to their own physiological sleep requirements to maintain normal levels of alertness and wakefulness and is thus chronically sleep deprived. The curtailed sleep pattern is present most days for at least several months.

The person's ability to initiate and maintain sleep is unimpaired. Sleep time is often markedly extended on weekend nights or during holidays compared to weekday. Extension of total sleep time results in resolution of the symptoms of sleepiness.

**Inclusions:** Behaviourally induced hypersomnia

**Exclusions:** Narcolepsy (7A20)

**7A2Y****Other specified hypersomnolence disorders****7A2Z****Hypersomnolence disorders, unspecified**

## Sleep-related breathing disorders (7A40-7A4Z)

Sleep related breathing disorders are characterised by abnormalities of respiration during sleep. In some of these disorders, respiration is also abnormal during wakefulness. The disorders are grouped into central sleep apnoeas, obstructive sleep apnoea, and sleep related hypoventilation or hypoxemia disorders.

**Exclusions:** Apnoea of newborn (KB2A)

**Coded Elsewhere:** Sleep related Cheyne-Stokes respiration (MD11.4)

**7A40**

### **Central sleep apnoeas**

Central sleep apnoeas are characterised by reduction or cessation of airflow due to absent or reduced respiratory effort. Central apnoea (cessation of airflow) or hypopnea (reduction in airflow) may occur in a cyclical or intermittent fashion. Patients with central sleep apnoea of various etiologies may also exhibit obstructive events, in which case diagnoses of both central sleep apnoea and obstructive sleep apnoea may be given.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

**Exclusions:** Central neonatal apnoea (KB2A.0)

**7A40.0**

### **Primary central sleep apnoea**

Primary central sleep apnoea is of unknown etiology (idiopathic) and is characterised by recurrent, predominantly central apnoeas. Airflow and respiratory effort cease simultaneously in a repetitive fashion over the course of the night. The recurrent episodes of apnoea (more than five per hour) and associated arousals are sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

**Exclusions:** Primary central sleep apnoea of infancy (7A40.1)

Primary central sleep apnoea of prematurity (7A40.2)

**7A40.1**

### **Primary central sleep apnoea of infancy**

Primary central sleep apnoea of infancy is characterised by prolonged (> 20 seconds), predominantly central apnoeas or periodic breathing during more than 5% of total sleep time in an infant of at least 37 weeks conceptional age. These events are typically associated with physiological compromise (hypoxemia, bradycardia), or the need for intervention such as stimulation or resuscitation. This diagnosis should be assigned when central events are the predominant finding, even if obstructive or mixed apnoeas or hypopneas are also present.

Note: A definitive diagnosis requires objective evidence based on polysomnography or alternative monitoring such as hospital or home monitoring.

**Exclusions:** Primary central sleep apnoea of prematurity (7A40.2)

**7A40.2**

**Primary central sleep apnoea of prematurity**

Primary central sleep apnoea of prematurity is characterised by prolonged (> 20 seconds), predominantly central apnoeas or periodic breathing during more than 5% of total sleep time in an infant of less than 37 weeks conceptional age. These events are typically associated with physiological compromise (hypoxemia, bradycardia), or the need for intervention such as stimulation or resuscitation. This diagnosis should be assigned when central events are the predominant finding, even if obstructive or mixed apnoeas or hypopneas are also present.

Note: A definitive diagnosis requires objective evidence based on polysomnography or alternative monitoring such as hospital or home monitoring.

**Exclusions:** Primary central sleep apnoea of infancy (7A40.1)

**7A40.3**

**Central sleep apnea with Cheyne-Stokes breathing**

Central sleep apnoea with Cheyne-Stokes breathing is characterised by recurrent, predominantly central apnoeas or central hypopneas (more than five per hour) alternating with a respiratory phase exhibiting a crescendo-decrescendo pattern of flow (or tidal volume). The longer cycle length (> 40 seconds) distinguishes central sleep apnoea with Cheyne-Stokes breathing from other central sleep apnoea types. The vast majority of patients with Central sleep apnoea with Cheyne-Stokes breathing have either systolic or diastolic heart failure. Patients with Central sleep apnoea with Cheyne-Stokes breathing have normal or low daytime arterial partial pressure of carbon dioxide (PaCO<sub>2</sub>). The disturbance is typically associated with atrial fibrillation/flutter, congestive heart failure, or a neurological disorder and is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

**7A40.4**

**Central sleep apnoea due to a medical condition without Cheyne-Stokes breathing**

Central sleep apnoea due to a medical condition without Cheyne-Stokes breathing (CSB) is characterised by recurrent, predominantly central apnoeas or central hypopneas (more than five per hour) that are attributed to a medical condition (and do not have the pattern of CSB). The majority of these patients have brainstem lesions of developmental, vascular, neoplastic, degenerative, demyelinating, or traumatic origin. The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnea, or snoring.

Note: A definitive diagnosis requires objective evidence based on polysomnography in the presence of a medical condition that is judged to be causing the symptoms.

**Exclusions:** Central sleep apnoea due to a medication or substance (7A40.6)

- 7A40.5 Central sleep apnoea due to high-altitude periodic breathing**  
High-altitude periodic breathing is characterised by alternating periods of central apnoea and hyperpnoea associated with recent ascent to high altitude (typically > 2500 meters). The pattern of periodic breathing is an expected response to ascent to elevation. The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring. The cycle length of this respiratory pattern is commonly less than 40 seconds and often as short as 12 to 20 seconds.
- Note: This diagnosis can be made clinically based on symptoms and recent ascent to high altitude.
- 7A40.6 Central sleep apnoea due to a medication or substance**  
Central sleep apnoea due to a medication is characterised by a pattern of recurring, predominantly central sleep apnoea or hypopnoea (more than five per hour) that is attributable to a medication or substance, most commonly long-acting opioids (e.g. methadone, long-acting morphine or oxycodone, fentanyl patches). The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring. Obstructive apnoeas and hypoventilation may be present, but central sleep apnoea is the predominant finding.
- Note: A definitive diagnosis requires objective evidence based on polysomnography in the context of medication or substance use that is judged to be causing the symptoms.
- 7A40.7 Treatment-emergent central sleep apnoea**  
Treatment-emergent central sleep apnoea is characterised by persistence or emergence of recurrent, predominantly central sleep apnoea (more than five per hour) during effective treatment for obstructive apnoea (obstructive or mixed apnoea or hypopnea) with positive airway pressure. Central apnoeas must be the predominant finding (>50% of total respiratory events). The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring. If the reduction or cessation of airflow due to absent or reduced respiratory effort is better explained by another central sleep apnoea disorder (e.g., Central sleep apnoea due to a medication or substance), that diagnosis along with a diagnosis of Obstructive sleep apnoea should be given, rather than a diagnosis of treatment-emergent central sleep apnoea.
- Note: A definitive diagnosis requires objective evidence based on polysomnography.
- 7A40.Y Other specified central sleep apnoeas**
- 7A40.Z Central sleep apnoeas, unspecified**

**7A41**

### **Obstructive sleep apnoea**

Obstructive sleep apnoea is characterised by repetitive episodes of apnoea or hypopnea that are caused by upper airway obstruction occurring during sleep. These events often result in reductions in blood oxygen saturation and are usually terminated by brief arousals from sleep. Excessive sleepiness is a major presenting complaint in many but not all cases. Reports of insomnia, poor sleep quality, and fatigue are also common. Upper airway resistance syndrome shares the same pathophysiology and should be classified here. In adults (> 18 years), obstructive sleep apnoea is diagnosed when the frequency of obstructive events (apnoeas, hypopneas or respiratory event-related arousals) is greater than 15 per hour. The disorder may also be diagnosed when the frequency is greater than five per hour and: a) symptoms attributable to the disorder (e.g., sleepiness or sleep disruption) are present; or b) nocturnal respiratory distress or observed apnoea/habitual snoring are reported; or c) when hypertension, a mood disorder, cognitive dysfunction, coronary artery disease, stroke, congestive heart failure, atrial fibrillation, or type 2 diabetes mellitus are present. In children, the disorder is diagnosed when the frequency of obstructive events is greater than one per hour, accompanied by signs or symptoms related to the breathing disorder.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

***Inclusions:*** Obstructive neonatal apnoea (KB2A.1)

**7A42**

### **Sleep-related hypoventilation or hypoxemia disorders**

The primary feature of these disorders is insufficient sleep related ventilation, resulting in abnormally elevated arterial partial pressure of carbon dioxide (PaCO<sub>2</sub>) during sleep. Sleep-related hypoxemia is diagnosed when overnight monitoring reveals sustained (> 5 minutes) decline in oxygen saturation to ≤ 88% in adults (or ≤ 90% in children) for ≥ 5 minutes.

Note: A definitive diagnosis requires objective evidence based on polysomnography as well as carbon dioxide (CO<sub>2</sub>) monitoring during sleep (by arterial, end-tidal or transcutaneous measures).

**7A42.0**

### **Obesity hypoventilation syndrome**

Obesity hypoventilation syndrome is characterised by obesity (in adults, Body-Mass-Index > 30 kg/m<sup>2</sup>) and daytime hypercapnia indicated by arterial partial pressure of carbon dioxide (PaCO<sub>2</sub>) > 45 mm Hg that cannot be fully attributed to an underlying cardiopulmonary or neurologic disease. Hypercapnia worsens during sleep and is often associated with severe arterial oxygen desaturation. Obstructive sleep apnoea is also present in the majority of cases and should be diagnosed in addition to obesity hypoventilation.

Note: A definitive diagnosis requires demonstration of daytime hypercapnia and objective evidence based on polysomnography, with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures).

***Inclusions:*** Pickwickian syndrome

**7A42.1****Congenital central alveolar sleep-related hypoventilation**

Congenital central alveolar hypoventilation syndrome (CCHS) is a disorder of autonomic dysfunction, primarily the failure of automatic central control of breathing, caused by a mutation of the PHOX2B gene. CCHS is characterised by hypoventilation, which is worse during sleep than wakefulness. Onset is usually at birth, and CCHS most commonly presents in an otherwise normal-appearing infant who is noted to have cyanosis, feeding difficulties, hypotonia or, less commonly, central apnoea. Severity is related to the specific mutation present. Individuals with milder variants of the disorder may not present for clinical attention until adulthood.

Note: A definitive diagnosis requires demonstration of PHOX2B mutation and objective evidence based on polysomnography with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures).

**7A42.2****Non-congenital central hypoventilation with hypothalamic abnormalities**

Non-congenital central hypoventilation with hypothalamic dysfunction is a disorder of central control of ventilation. Patients are usually healthy until early childhood (often 2-3 years of age) when they develop hyperphagia and severe obesity, followed by central hypoventilation, which often presents as respiratory failure. Hypothalamic endocrine dysfunction may be characterised by increased or decreased hormone levels and may include one or more of the following: diabetes insipidus, inappropriate antidiuretic hormone hypersecretion, precocious puberty, hypogonadism, hyperprolactinemia, hypothyroidism, and decreased growth hormone secretion, or tumours of neural origin. Mood and behaviour abnormalities, sometimes severe, are often present. Developmental delay or autistic features may be present, but many patients are cognitively normal.

Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures).

**7A42.3****Idiopathic central alveolar hypoventilation**

Idiopathic central alveolar hypoventilation is defined as the presence of decreased alveolar ventilation resulting in sleep related hypercapnia and hypoxemia in individuals with presumed normal mechanical properties of the lung and respiratory pump. Chronic hypoventilation during sleep exists without any readily identifiable impairments of respiration, such as pulmonary airway or parenchymal conditions, neurologic, neuromuscular or chest wall abnormalities, severe obesity, other sleep related breathing disorder, or use of respiratory depressant medications or substances. Diurnal as well as nocturnal hypoventilation is believed to be due primarily to blunted chemoresponsiveness to carbon dioxide (CO<sub>2</sub>) and oxygen (O<sub>2</sub>). Patients may complain of morning headaches, fatigue, neurocognitive decline and sleep disturbance, or may be entirely asymptomatic.

Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures).

- 7A42.4 Sleep-related hypoventilation due to a medication or substance**  
Sleep-related hypoventilation due to a medication or substance is characterised primarily by chronic hypoventilation and hypercapnia due to prolonged use of medications or substances known to depress ventilatory drive and/or impair respiratory muscle mechanics (e.g. long-acting narcotics, anesthetics, sedative compounds, and muscle relaxants). Hypoxemia is commonly present as well. Hypercapnia may also be present during wakefulness in some patients. Patients can either be asymptomatic or present with complaints of dyspnea, chest tightness, or fatigue.  
Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures) in the context of medication or substance use that is judged to be causing the symptoms.
- 7A42.5 Sleep-related hypoventilation due to medical condition**  
Sleep-related hypoventilation due to medical condition is characterised by sleep-related hypoventilation due to lung airway or parenchymal disease, chest wall disorders, pulmonary hypertension, or neurologic and neuromuscular disorders. Daytime hypercapnia may also be present. Sleep related hypoxemia may be severe. Patients can either be asymptomatic or present with complaints of dyspnea, chest tightness, or fatigue.  
Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures) in the presence of a medical condition that is judged to be causing the symptoms.
- Exclusions:**
- Obesity hypoventilation syndrome (7A42.0)
  - Congenital central alveolar sleep-related hypoventilation (7A42.1)
- 7A42.6 Sleep-related hypoxemia due to a medical condition**  
Sleep related hypoxemia due to a medical condition is characterised by sustained declines in SpO<sub>2</sub> (oxygen saturation measured by pulse oximeter) ( $\leq 88\%$  in adults or  $\leq 90\%$  in children for  $\geq 5$  minutes) during sleep. The condition is attributable to a medical or neurological disorder. The presence of hypoxemia is not better explained by another sleep related breathing disorder (e.g., obstructive sleep apnoea). Although some amount of obstructive or central apnoea may be present, these disorders are not thought to be primarily responsible for the hypoxemia during sleep. Some patients with sleep related hypoxemia also exhibit hypoxemia during wakefulness. If the presence of hypercapnia has been established, a diagnosis of sleep-related hypoventilation should be made, rather than sleep-related hypoxemia.  
Note: A definitive diagnosis requires objective evidence based on polysomnographic monitoring of oxygen saturation in arterial blood (SaO<sub>2</sub>) in the presence of a medical condition that is judged to be causing the declines in SaO<sub>2</sub>.
- 7A42.Y Other specified sleep-related hypoventilation or hypoxemia disorders**
- 7A42.Z Sleep-related hypoventilation or hypoxemia disorders, unspecified**
- 7A4Y Other specified sleep-related breathing disorders**

**7A4Z****Sleep-related breathing disorders, unspecified****Circadian rhythm sleep-wake disorders (7A60-7A6Z)**

Circadian rhythm sleep-wake disorders are disturbances of the sleep-wake cycle (typically manifest as insomnia, excessive sleepiness, or both) due to alterations of the circadian time-keeping system, its entrainment mechanisms, or a misalignment of the endogenous circadian rhythm and the external environment. Sleep logs and, if possible, actigraphy for a minimum of one week should be utilized to define the specific sleep-wake schedule disturbance.

- Inclusions:**
- Delayed sleep phase syndrome
  - Irregular sleep-wake pattern

**7A60****Delayed sleep-wake phase disorder**

Delayed sleep-wake phase disorder is a recurrent pattern of disturbance of the sleep-wake schedule characterised by persistent delay in the major sleep period compared to conventional or desired sleep times. The disorder results in difficulty falling asleep and difficulty awakening at desired or required times. When sleep is allowed to occur on the delayed schedule, it is essentially normal in quality and duration. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

**7A61****Advanced sleep-wake phase disorder**

Advanced sleep-wake phase disorder is a recurrent pattern of disturbance of the sleep-wake schedule characterised by persistent advance (to an earlier time) of the major sleep period compared to conventional or desired sleep times. The disorder results in evening sleepiness (prior to the desired bedtime) and awakening earlier than the desired or required times. When sleep is allowed to occur on the advanced schedule, it is essentially normal in quality and duration. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

**7A62****Irregular sleep-wake rhythm disorder**

Irregular sleep-wake rhythm disorder is characterised by absence of a clearly-defined cycle of sleep and wake. Sleep becomes distributed in multiple episodes of variable duration throughout the 24-hour period. Patients typically complain of insomnia and/or excessive daytime sleepiness as a result of the condition. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

**7A63**

### **Non-24 hour sleep-wake rhythm disorder**

Non-24 hour sleep-wake rhythm disorder is characterised by periods of insomnia and/or daytime sleepiness, alternating with periods of relatively normal sleep, due to a lack of entrainment of the circadian clock to the 24-hour environmental cycle. The period length of the circadian/sleep-wake cycle is typically longer than 24 hours. Symptoms occur as the circadian-controlled sleep-wake propensity cycles in and out of phase with the environmental day-night cycle. The disorder is seen most commonly in individuals with complete blindness. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

**7A64**

### **Circadian rhythm sleep-wake disorder, shift work type**

Circadian rhythm sleep-wake disorder, shift work type is characterised by complaints of insomnia and/or excessive sleepiness that occur as a result of work shifts that overlap with all or a portion of conventional nighttime sleep periods. The disorder is also associated with a reduction in total sleep time. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

**7A65**

### **Circadian rhythm sleep-wake disorder, jet lag type**

Circadian rhythm sleep-wake disorder, jet lag type is characterised by a temporary mismatch between the timing of the sleep and wake cycle generated by the endogenous circadian clock and that of the sleep and wake pattern required by transmeridian travel across at least two time zones. Individuals complain of disturbed sleep, sleepiness and fatigue, somatic symptoms (e.g. gastrointestinal distress) or impaired daytime function. The severity and duration of symptoms is dependent on the number of time zones traveled, the ability to sleep while traveling, exposure to appropriate circadian times cues in the new environment, tolerance to circadian misalignment when awake during the biological night, and the direction of the travel. The symptoms result in significant distress or mental, physical, social, occupational or academic impairment.

**7A6Z**

### **Circadian rhythm sleep-wake disorders, unspecified**

## Sleep-related movement disorders (7A80-7A8Z)

Sleep related movement disorders are primarily characterised by relatively simple, usually stereotyped, movements that disturb sleep or its onset. An exception is Restless legs syndrome, which is primarily a waking, sensorimotor experience but is included in Sleep-related movement disorders because it almost always also involves periodic limb movements during sleep.

**Coded Elsewhere:** REM sleep behaviour disorder (7B01.0)

**7A80**

### **Restless legs syndrome**

Restless legs syndrome is a waking sensorimotor disorder characterised by a complaint of a strong, nearly irresistible urge to move the limbs. This urge to move is often but not always accompanied by other uncomfortable sensations felt deep inside the limbs. Although the legs are most prominently affected, a significant percentage of individuals with Restless legs syndrome describe some arm sensations. The symptoms of Restless legs syndrome are worse at rest, alleviated with movement, and predominant in the evening or night. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep). The vast majority of individuals with Restless legs syndrome also exhibit periodic limb movements during sleep. A separate diagnosis of Periodic limb movement disorder is not warranted in such cases because the limb movements during sleep are considered to be an expected part of Restless legs syndrome.

**7A81**

### **Periodic limb movement disorder**

Periodic limb movement disorder is characterised by periodic episodes of repetitive (> 5/hour in children or > 15/hour in adults), highly stereotyped limb movements that occur during sleep, in conjunction with significant difficulties with sleep initiation or maintenance or fatigue that cannot be accounted for by another primary sleep disorder or other etiology. Specifically, when periodic limb movements are associated with Restless legs syndrome, narcolepsy or REM sleep behaviour disorder, a separate diagnosis of Periodic limb movement disorder is not warranted because the limb movements during sleep are considered an expected part of these disorders. Periodic limb movements occur most frequently in the lower extremities but may be seen in the arms as well. They may be associated with recurrent arousal from sleep, which gives rise to sleep disruption. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep).

Note: A definitive diagnosis requires objective evidence based on polysomnography.

**7A82**

### **Sleep-related leg cramps**

Sleep related leg cramps are painful sensations in the leg or foot associated with sudden, involuntary muscle hardness or tightness, indicating a strong muscle contraction. They typically last from a few seconds to several minutes. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep).

**7A83**

### **Sleep-related bruxism**

Sleep-related bruxism is characterised by repetitive, rhythmic jaw muscle contractions that occur during sleep. These contractions can take the form of repetitive phasic muscle contractions or isolated sustained jaw clenching (tonic contractions). These contractions during sleep produce tooth-grinding sounds. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep) or significant damage to the teeth.

**7A84**

### **Sleep-related rhythmic movement disorder**

Sleep related rhythmic movement disorder is characterised by repetitive, stereotyped, and rhythmic motor behaviours that involve large muscle groups (e.g., banging head against pillow or mattress, head rolling, body rocking, body rolling). The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep) or result in bodily injury (e.g., due to falling out of bed).

**7A85**

### **Benign sleep myoclonus of infancy**

Benign sleep myoclonus of infancy is characterised by repetitive myoclonic jerks that occur during sleep in neonates and infants. Benign sleep myoclonus of infancy is commonly confused with epilepsy. However, unlike the jerks of myoclonic seizures and myoclonic encephalopathy, the jerks of Benign sleep myoclonus of infancy occur exclusively during sleep. The jerks are often bilateral and massive, typically involving large muscle groups.

**7A86**

### **Propriospinal myoclonus at sleep onset**

Propriospinal myoclonus at sleep onset consists of sudden myoclonic jerks of the trunk, hips, and knees in a fixed pattern that occur during the transition from wakefulness to sleep and, more rarely, during nighttime awakenings or upon awakening in the morning. The jerks arise mainly in spinally innervated muscles and thereafter propagate to rostral and caudal muscles at a low speed, typical of propriospinal pathways. The movements result in clinically significant difficulty with sleep initiation or maintenance.

**7A87**

### **Sleep-related movement disorder due to a medical condition**

Sleep-related movement disorder due to a medical condition is characterised by sleep-related movement abnormalities that are directly attributable to an underlying neurological or medical condition. Many medical conditions, particularly diseases of the nervous system, may be associated with movement abnormalities that are evident in wake and sleep. In some cases, the nocturnal manifestations of the movement abnormalities may be apparent before establishment of a firm neurological diagnosis. Once the presence of a medical or neurological condition is clearly established, this diagnosis should only be assigned if the sleep-related aspects of the movement abnormality or its sequelae are the focus of independent clinical attention.

**Coding Note:** Code also the causing condition

**7A88****Sleep-related movement disorder due to a medication or substance**

Sleep-related movement disorder due to a medication or substance is characterised by sleep-related movement abnormalities that are directly attributable to the effect of a medication or substance. Many substances may be associated with movement abnormalities that are evident in wake and sleep. To the extent that the movement abnormality is an expected complication of the substance(s) involved (e.g., tardive dyskinesia or akathisia associated with neuroleptic usage), this diagnosis should only be assigned if the sleep-related aspects of the movement abnormality or its sequelae are the focus of independent clinical attention.

**7A8Y****Other specified sleep-related movement disorders****7A8Z****Sleep-related movement disorders, unspecified****Parasomnia disorders (7B00-7B0Z)**

Parasomnias are problematic behavioural or physiological events that occur while falling asleep, during sleep, or upon arousal from sleep. Parasomnias may occur during non-rapid eye movement sleep (NREM), rapid eye movement sleep (REM), or during transitions to and from sleep. They encompass abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, and autonomic nervous system activity.

**7B00****Disorders of arousal from non-REM sleep**

Disorders of arousal from non-REM sleep are characterised by experiences or behaviours such as confusion, ambulation, terror, or extreme autonomic arousal that typically arise as a result of incomplete arousals from deep non-REM (N3) sleep. An exception is sleep-related eating disorder, which has been observed to arise during all stages of non-REM sleep. This group of disorders is also characterised by partial or complete amnesia for the event, inappropriate or absent responsiveness to efforts by others to intervene or redirect the person during the episode, and limited (e.g., a single visual scene) or no associated cognition or dream imagery. The experiences or behaviours are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others (e.g., thrashing or striking out in response to efforts to restrain the individual).

**7B00.0****Confusional arousals**

Confusional arousals are characterised by mental confusion or confused behaviour (e.g., disorientation, being unresponsive, impaired or slow speech, poor memory) during a partial arousal from deep sleep. There is partial or complete amnesia for the events. The experiences or behaviours are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others.

**7B00.1****Sleepwalking disorder**

Sleepwalking disorder is characterised by ambulation and other complex behaviours during a partial arousal from deep sleep.

- 7B00.2 Sleep terrors**  
Sleep terrors are characterised by episodes of abrupt terror during a partial arousal from deep sleep, typically beginning with a vocalization such as a frightening scream. The individual experiences intense fear accompanied by signs of autonomic arousal, such as mydriasis, tachycardia, tachypnea, and diaphoresis.
- 7B00.3 Sleep-related eating disorder**  
Sleep-related eating disorder is characterised by recurrent episodes of involuntary excessive or dangerous eating or drinking that occur during the main sleep period that are not attributable to the effects of a medication or substance. Episodes may involve consumption of peculiar forms or combinations of food or inedible or toxic substances or injurious or potentially injurious behaviours performed while in pursuit of food or while cooking food. There may be adverse health consequences from recurrent nocturnal binge eating of high calorie foods. There is partial or complete amnesia for the events.
- 7B00.Y Other specified disorders of arousal from non-REM sleep**
- 7B00.Z Disorders of arousal from non-REM sleep, unspecified**
- 7B01 Parasomnias related to REM sleep**  
Parasomnias related to REM (rapid eye movement) sleep are characterised by experiences or behaviours such as vocalization or complex motor behaviours, sleep paralysis, or nightmares that are associated with REM sleep. The experiences are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others.
- 7B01.0 REM sleep behaviour disorder**  
REM sleep behaviour disorder is characterised by repeated episodes of sleep related vocalization or complex motor behaviours that are either documented by polysomnography to occur during REM (rapid eye movement) sleep or are presumed to occur during REM sleep due to a clinical history of dream enactment. Polysomnographic recording (when performed) demonstrates REM sleep without atonia. The disorder may occur as an isolated, idiopathic form but is frequently associated with latent or manifest disease of the nervous system, especially alpha-synucleinopathies.  
  
Note: A provisional diagnosis may be established on clinical grounds but definitive diagnosis requires polysomnographic demonstration of REM sleep without atonia.
- 7B01.1 Recurrent isolated sleep paralysis**  
Recurrent isolated sleep paralysis consists of recurrent inability to move the trunk and all of the limbs at sleep onset (hypnagogic) or upon awakening (hypnopompic) from sleep. Episodes typically last from a few seconds to a few minutes and cause clinically significant distress including bedtime anxiety or fear of sleep.

7B01.2	<b>Nightmare disorder</b> Nightmare disorder is characterised by recurrent, vivid and highly dysphoric dreams, often involving threat to the individual, that generally occur during REM sleep and that often result in awakening with anxiety. The person is rapidly oriented and alert upon awakening.
	<b>Inclusions:</b> Dream anxiety disorder
7B01.Y	<b>Other specified parasomnias related to REM sleep</b>
7B01.Z	<b>Parasomnias related to REM sleep, unspecified</b>
7B02	<b>Other parasomnias</b> Other parasomnias include Hypnagogic exploding head syndrome, Sleep-related hallucinations, and abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, or autonomic nervous system activity related to a medical condition or due to a medication or substance. The experiences are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others.
	<b>Coded Elsewhere:</b> Nocturnal enuresis (6C00.0)
7B02.0	<b>Hypnagogic exploding head syndrome</b> Hypnagogic exploding head syndrome is characterised by the perception of a sudden, loud noise or sense of a violent explosion in the head that typically occurs as the individual is falling asleep. On occasion, these episodes may occur with awakening during the night. They are associated with abrupt arousal following the event, often with a sense of fright.
	<b>Inclusions:</b> Hypnagogic sensory disturbance
7B02.1	<b>Sleep-related hallucinations</b> Sleep related hallucinations are hallucinatory experiences that occur at sleep onset (hypnagogic hallucinations) or on awakening from sleep (hypnopompic hallucinations). Sleep related hallucinations are predominantly visual but may include auditory, tactile, or kinetic phenomena.
7B02.2	<b>Parasomnia disorder due to a medical condition</b> Parasomnia disorder due to a medical condition is characterised by abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, or autonomic nervous system activity that are directly attributable to an underlying neurological or medical condition.
7B02.3	<b>Parasomnia disorder due to a medication or substance</b> Parasomnia disorder due to a medication or substance is characterised by abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, and autonomic nervous system activity that are directly attributable to the effect of a medication or substance.
7B0Y	<b>Other specified parasomnia disorders</b>
7B0Z	<b>Parasomnia disorders, unspecified</b>

# CHAPTER 08

---

## Diseases of the nervous system

This chapter has 204 four-character categories.

Code range starts with 8A00

This is a group of conditions characterised as being in or associated with the nervous system.

- Exclusions:**
- Endocrine, nutritional or metabolic diseases (Chapter 05)
  - Complications of pregnancy, childbirth and the puerperium (Chapter 18)
  - Certain conditions originating in the perinatal period (Chapter 19)
  - Injury, poisoning or certain other consequences of external causes (Chapter 22)

- Coded Elsewhere:**
- Injuries of the nervous system
  - Neoplasms of the nervous system
  - Structural developmental anomalies of the nervous system (LA00-LA0Z)
  - Syndromes with central nervous system anomalies as a major feature (LD20)
  - Non-viral and unspecified infections of the central nervous system (1D00-1D0Z)
  - Symptoms, signs or clinical findings of the nervous system (MB40-MB9Y)
  - Paralytic symptoms (MB50-MB5Z)
  - Dissociative neurological symptom disorder (6B60)
  - Diseases of the nervous system complicating pregnancy, childbirth or the puerperium (JB64.3)

This chapter contains the following top level blocks:

- Movement disorders
- Disorders with neurocognitive impairment as a major feature
- Multiple sclerosis or other white matter disorders
- Epilepsy or seizures
- Headache disorders
- Cerebrovascular diseases
- Spinal cord disorders excluding trauma
- Motor neuron diseases or related disorders
- Disorders of nerve root, plexus or peripheral nerves
- Diseases of neuromuscular junction or muscle
- Cerebral palsy
- Nutritional or toxic disorders of the nervous system
- Disorders of cerebrospinal fluid pressure or flow

- Disorders of autonomic nervous system
- Human prion diseases
- Disorders of consciousness
- Other disorders of the nervous system
- Postprocedural disorders of the nervous system
- Injuries of the nervous system
- Neoplasms of the nervous system

## Movement disorders (8A00-8A0Z)

This is a group of involuntary movement disorders.

**Coded Elsewhere:** Restless legs syndrome (7A80)

Periodic limb movement disorder (7A81)

Hemifacial spasm (8B88.2)

**8A00**

### Parkinsonism

Parkinsonism is a clinical syndrome characterised by four cardinal features: rest tremor, muscular rigidity, akinesia or bradykinesia, and postural disturbances which include shuffling gait and flexed posture and loss of postural reflexes. Bradykinesia and one other clinical feature is required to make a diagnosis of Parkinsonism. Parkinsonism may result from a variety of conditions including progressive neurodegenerative disorders such as Parkinson Disease or Atypical Parkinsonism where the progressive degeneration of nigral and other neurons leads to dopamine deficiency. Parkinsonism may also be a result of structural lesions such as strokes or tumours or blockage of dopamine receptors in the striatum by drugs such as neuroleptics.

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Arthropathies (FA00-FA5Z)

**8A00.0**

### Parkinson disease

Parkinson Disease is a gradual onset progressive degenerative disease whose cardinal manifestations include bradykinesia plus one of the following-tremor, rigidity or postural instability. Nonmotor manifestations include autonomic dysfunction and neuropsychiatric features.

**8A00.00**

#### Sporadic Parkinson disease

This is defined as Parkinson Disease occurring sporadically with no apparent mode of inheritance.

**8A00.01**

#### Familial Parkinson disease

Familial subtype of Parkinson Disease, a disorder caused by progressive dopaminergic neuron degeneration of the substantia nigra that is characterized by resting tremor, bradykinesia, and rigidity. Familial cases can be caused by mutations in LRRK2, PARK7, PINK1, PRKN, or SNCA genes.

<b>8A00.0Y</b>	Other specified Parkinson disease
<b>8A00.0Z</b>	Parkinson disease, unspecified
<b>8A00.1</b>	<p><b>Atypical parkinsonism</b></p> <p>Atypical parkinsonism is a term used to describe several neurodegenerative conditions where the degeneration extends beyond the substantia nigra and is more extensive than seen in conditions like Parkinson disease. The clinical picture is often more complex than PD and patients may have apraxia, supranuclear ophthalmoplegia or autonomic failure.</p> <p><b>Coded Elsewhere:</b> Multiple system atrophy, Parkinsonism (8D87.01) Lewy body disease (8A22)</p>
<b>8A00.10</b>	<p>Progressive supranuclear palsy</p> <p>Progressive supranuclear palsy (PSP) is a late-onset neurodegenerative disease characterised by supranuclear gaze palsy, postural instability, progressive rigidity, and mild dementia. Five clinical variants have been described with clinicopathological correlations: Classical PSP (Richardson's syndrome), and four atypical variants of PSP including PSP-Parkinsonism (PSP-P), PSP-Pure akinesia with gait freezing (PSP-PAGF), PSP-corticobasal syndrome (PSP-CBS), and PSP-progressive non fluent aphasia (PSP-PNFA).</p>
<b>8A00.1Y</b>	Other specified atypical parkinsonism
<b>8A00.1Z</b>	Atypical parkinsonism, unspecified
<b>8A00.2</b>	<p><b>Secondary parkinsonism</b></p> <p>Secondary parkinsonism is a term used to describe Parkinsonism due to a known agent such as drugs, infections, toxins or structural lesions.</p> <p><b>Coding Note:</b> Code also the causing condition</p>
<b>8A00.20</b>	<p>Parkinsonism due to heredodegenerative disorders</p> <p>Parkinsonism may occur as a result of more widespread heredodegenerative disorders. It is accompanied by other neurological findings such as dystonia, ataxia and dementia. Other family members may be affected.</p> <p><b>Coding Note:</b> Code also the causing condition</p>
<b>8A00.21</b>	<p>Hemiparkinsonism hemiatrophy syndrome</p> <p>Hemiparkinsonism may follow hemiatrophy of the body due to an intrauterine or early neonatal cerebral damage.</p>
<b>8A00.22</b>	<p>Infectious or postinfectious parkinsonism</p> <p>A syndrome caused by an infection with a bacterial, viral, fungal, or parasitic source, which occurs during or after the acute phase of the infection. This condition is characterised by tremors, slow movement, or stiffness of the arms and legs, similar to symptoms seen in Parkinson disease.</p>

- 8A00.23** Vascular parkinsonism  
Multiple lacunar infarcts or diffuse vascular disease of the brain can result in Parkinsonism- imaging often shows multiple lacunar infarcts or diffuse white matter change. The dopamine transporter scan may be normal or abnormal depending upon the site of the infarcts.
- 8A00.24** Drug-induced parkinsonism  
Parkinsonism due to prescription medications.
- 8A00.25** Post traumatic Parkinsonism  
Parkinsonism may be a result of a major head trauma where it occurs in combination with other neurological findings such as weakness and pyramidal signs. It may also occur as a result of multiple blows to the head and may be associated with dementia. It is also called chronic traumatic encephalopathy.
- 8A00.26** Parkinsonism due to structural lesions  
Parkinsonism occurring in the setting of a demonstrable structural lesion such as subdural hematoma and brain tumours. Neuroimaging such as Magnetic Resonance Imaging is very helpful. It has to be emphasized that small brain tumours such as meningioma may be an incidental finding in cases of otherwise typical PD.
- 8A00.2Y** Other specified secondary parkinsonism  
**Coding Note:** Code also the causing condition
- 8A00.2Z** Secondary parkinsonism, unspecified  
**Coding Note:** Code also the causing condition
- 8A00.3** **Functional parkinsonism**  
Functional movement disorder with mixed features of functional tremor but also slowness and stiffness which can be demonstrated to be variable and internally inconsistent. No cause has been identified after investigation.  
**Inclusions:** Psychogenic parkinsonism
- 8A00.Y** Other specified parkinsonism
- 8A00.Z** Parkinsonism, unspecified
- 8A01** **Choreiform disorders**  
Chorea consists of irregular, non-repetitive, brief, jerky, flowing movements that move randomly from one part of the body to another.
- 8A01.0** **Benign hereditary chorea**  
Benign hereditary chorea should be considered in people with a relatively stable, nonprogressive chorea, in whom childhood onset and an autosomal dominant family history are present. Benign hereditary chorea can be associated with short stature and developmental delay. Larger deletions of causative gene, TITF-1, can cause a multisystem disorder with congenital hypothyroidism, hypotonia, and pulmonary problems.

<b>8A01.1</b>	<b>Secondary Chorea</b> Chorea consists of irregular, non-repetitive, brief, jerky, flowing movements that move randomly from one part of the body to another. Chorea can be seen in a variety of metabolic, immunological and other disorders and is termed secondary chorea.
<b>Coding Note:</b>	Code also the causing condition
	<b>Exclusions:</b> Benign hereditary chorea (8A01.0)
<b>8A01.10</b>	Huntington disease Huntington disease (HD) is a rare neurodegenerative disorder of the central nervous system. HD is an autosomal dominant disorder due to a mutation resulting in an increased number of triplicate cytosine-adenine-guanine repeats on chromosome 4. The manifestations include chorea, dementia and personality changes. In the Westphal variant dystonia and parkinsonism are prominent. Neuroimaging reveals caudate atrophy. A genetic test is available and may facilitate presymptomatic detection.
	<b>Inclusions:</b> Huntington chorea
<b>8A01.11</b>	Chorea due to Huntington disease-like conditions The clinical picture of Huntington Disease (HD) is closely mimicked by disorders with an autosomal dominant inheritance. The gene test for HDS is negative prompting the consideration of other disorders. These are called HD like (HDL diseases).
<b>8A01.12</b>	Chorea due to Dentatorubral pallidoluysian atrophy Dentatorubropallidoluysian atrophy patients may have chorea as a major manifestation.
<b>8A01.13</b>	Chorea due to Wilson disease
<b>Coding Note:</b>	Code also the causing condition
<b>8A01.14</b>	Chorea due to infectious or para-infectious causes
<b>Coding Note:</b>	Code also the causing condition
<b>8A01.15</b>	Chorea due to systemic lupus erythematosus Chorea may be a presenting manifestation of systemic lupus erythematosus (SLE) or may occur in established disease. It is associated with the presence of antiphospholipid antibodies.
<b>8A01.16</b>	Drug-induced chorea Chorea may be due to prescribed and illicit drugs.
<b>8A01.1Y</b>	Other specified secondary chorea
<b>Coding Note:</b>	Code also the causing condition
<b>8A01.1Z</b>	Secondary chorea, unspecified
<b>Coding Note:</b>	Code also the causing condition

- 8A01.2** **Hemichorea or hemiballismus**  
 Ballism (“ballismós” meaning ‘jumping around’ in Ancient Greek) refers to violent, irregular flinging movements of the limbs primarily due to contractions of the proximal muscles. Hemiballism refers to movements involving upper and lower extremities on the same side with or without involvement of the face.
- Hemichorea refers to hemibody chorea with brief non repetitive jerks affecting arm and leg on one side with or without involvement of the face.
- 8A01.20** **Hemichorea**  
 Hemichorea refers to hemibody chorea with brief non repetitive jerks affecting arm and leg on one side with or without involvement of the face.
- 8A01.21** **Ballism**  
 Ballism (“ballismós” meaning ‘jumping around’ in Ancient Greek) refers to violent, irregular flinging movements of the limbs primarily due to contractions of the proximal muscles.
- 8A01.22** **Hemiballism**  
 Hemiballism refers to movements involving upper and lower extremities on the same side with or without involvement of the face.
- 8A01.2Y** **Other specified hemichorea or hemiballismus**
- 8A01.2Z** **Hemichorea or hemiballismus, unspecified**
- 8A01.Y** **Other specified choreiform disorders**
- 8A01.Z** **Choreiform disorders, unspecified**
- 8A02** **Dystonic disorders**  
*Exclusions:*      athetoid cerebral palsy (8D21)
- 8A02.0** **Primary dystonia**  
 Primary dystonias (primary torsion dystonias) are disorders where dystonia is the sole neurological manifestation. These disorders are slowly progressive and may be familial/genetic or sporadic in origin.
- 8A02.00** **Benign essential blepharospasm**  
 This is a neurological condition characterised by forcible closure of the eyelids due to involuntary and sustained contraction of the muscles around the eyes.
- 8A02.0Y** **Other specified primary dystonia**
- 8A02.0Z** **Primary dystonia, unspecified**
- 8A02.1** **Secondary dystonia**  
 This is dystonia – a disorder of involuntary muscle contractions – of an acquired nature. Causes include substance toxicity, injury, hypoxia and tumours.
- Coding Note:** Code also the causing condition

- 8A02.10** Drug-induced dystonia  
 This is dystonia due to medications either as an idiosyncratic side effect or due to overdose of medications.
- 8A02.11** Dystonia-plus  
 This is a group of heterogenous syndromes present with dystonia – a disorder of involuntary muscle contractions – along with other clinical features, but not in tandem with a neurodegenerative disease. Examples include myoclonus dystonia and dopa responsive dystonia.
- 8A02.12** Dystonia associated with heredodegenerative disorders  
 Dystonia occurring as a part of a more complex heredodegenerative disorder. It is not a pure dystonia and other neurological findings such as ataxia, pyramidal signs and cognitive issues may be seen.
- 8A02.1Y** Other specified secondary dystonia  
**Coding Note:** Code also the causing condition
- 8A02.1Z** Secondary dystonia, unspecified  
**Coding Note:** Code also the causing condition
- 8A02.2** **Paroxysmal dystonia**  
 Paroxysmal dyskinesias are a group of rare movement disorders characterised by their recurrent and episodic nature, arising from a background of normal motor activity and behaviour. These abnormal movements can manifest in the form of ballism, dystonia, chorea and athetosis or a combination of these.
- 8A02.3** **Functional dystonia or spasms**  
 Functional movement disorder presenting predominantly with mobile or fixed dystonic posturing which is incongruous with other causes of dystonia and may be responsive to placebo therapy or psychotherapy. Typically a clenched fist, inverted ankle or orbicularis oculis/platysma contraction with onset as a teenager or adult.  
 Functional dystonia or spasms where no cause has been identified after investigation.
- 8A02.Y** Other specified dystonic disorders
- 8A02.Z** Dystonic disorders, unspecified
- 8A03** **Ataxic disorders**  
 Disorders associated with ataxia. The word "ataxia" comes from a Greek word meaning "lack of order, indiscipline". People with ataxia have problems with coordination because parts of the nervous system that control movement and balance are affected. Ataxia may affect the fingers, hands, arms, legs, body, speech, and eye movements.
- 8A03.0** **Congenital ataxia**  
 Congenital Ataxia is defined as a lack of coordination due to congenital abnormalities in the cerebellum. It is usually nonprogressive.

- 8A03.1** **Hereditary ataxia**  
 A group of genetic disorders characterised by slowly progressive incoordination of gait and often associated with poor coordination of hands, speech, and eye movements
- Exclusions:** Metabolic disorders (5C50-5D2Z)  
 Cerebral palsy (8D20-8D2Z)
- 8A03.10** Friedreich ataxia  
 Friedreich ataxia is an autosomal recessive ataxia characterised by difficulties to coordinate movements, associated with neurological signs (dysarthria, loss of reflexes, decrease of deep sensation, pes cavus and scoliosis), cardiomyopathy and sometimes diabetes mellitus. It is due to a mutation in the frataxin gene.
- Coded Elsewhere:** Hereditary optic neuropathy associated with hereditary ataxias (8A03.15)
- 8A03.11** Ataxia due to Cerebrotendinous xanthomatosis  
 Ataxia in the setting of cerebrotendinous xanthomatosis, a rare autosomal recessive disorder of bile acid metabolism caused by a mutation in the CYP27A1 gene encoding mitochondrial enzyme sterol 27-hydroxylase. Accumulation of sterols in multiple tissues leads to premature cataracts and tendon xanthomas in late childhood, followed by progressive neurological dysfunction such as ataxia, dementia, and polyneuropathy.
- 8A03.12** Ataxia due to Refsum disease  
 Ataxia in the setting of Refsum disease, a rare autosomal recessive disorder caused by a mutation in the PHYH gene coding for peroxisomal phytanoyl-CoA hydroxylase or PEX7, coding for peroxin 7 receptor protein. Onset is usually in late childhood, initially presenting with retinitis pigmentosa, with progression to ataxia and chronic polyneuropathy.
- 8A03.13** Ataxia due to abetalipoproteinemia  
 Ataxia in the setting of abetalipoproteinemia, a rare autosomal recessive disorder caused by a mutation of the MTP gene coding for microsomal triglyceride transfer protein which impairs the ability to produce very low density lipoprotein. All patients have fat malabsorption, acanthocytosis, hypocholesterolemia, and absent apolipoprotein B.
- 8A03.14** Hereditary episodic ataxia  
 Autosomal dominant disorders associated with intermittent episodes of cerebellar dysfunction, with normal functioning or minimal ataxia and nystagmus between episodes. The two major subtypes include EA1 and EA2. EA1 is caused by a mutation of the KCNA1 gene coding and characterized by episodes triggered by exercise and muscle myokymia. EA2 is caused by a mutation in CACNA1A gene and involves more prolonged attacks of ataxia (lasting hours to days), and interictal residual ataxia with nystagmus.
- 8A03.15** Ataxia due to mitochondrial mutations

- 8A03.16** Spinocerebellar ataxia  
Autosomal dominantly inherited ataxias associated with over 37 gene loci that involve progressive degeneration of the cerebellum and spinocerebellar tracts of the spinal cord, presenting with characteristic sensory loss, diminished tendon reflexes, Romberg sign, and positive Babinski sign(s).
- 8A03.1Y** Other specified hereditary ataxia
- 8A03.1Z** Hereditary ataxia, unspecified
- 8A03.2** **Non-hereditary degenerative ataxia**  
Ataxia is characterized by incoordination, due to lesions in the cerebellum and efferent or afferent connections. Sporadic forms of ataxia that present without any family history or known genetic cause. Diagnosis is made after ruling out other causes of ataxia.
- 8A03.20** Late onset cerebellar cortical atrophy  
This is a sporadic late onset cerebellar cortical atrophy with progressive ataxia. Neuropathologically it is characterised by diffuse cerebellar cortical lesions and absence of neuronal loss in the dorsomedial part of the inferior olives.  
**Exclusions:** Hereditary ataxia (8A03.1)
- 8A03.2Y** Other specified non-hereditary degenerative ataxia
- 8A03.2Z** Non-hereditary degenerative ataxia, unspecified
- 8A03.3** **Acquired ataxia**  
Ataxia that is caused by a variety of exogenous and endogenous factors and is not clearly hereditary. May be seen in the setting of drug toxicity, post-viral cerebellitis, acute disseminated encephalomyelitis, traumatic brain injury, hypoxia, heat stroke, Wernicke's encephalopathy, Miller Fisher syndrome, basilar migraine, or conversion reaction.
- 8A03.30** Ataxia due to alcoholic cerebellar degeneration  
This is the most common form of acquired ataxia and occurs among people suffering from degeneration of the cerebellum as a result of chronic alcohol use.
- 8A03.3Y** Other specified acquired ataxia
- 8A03.3Z** Acquired ataxia, unspecified
- 8A03.Y** **Other specified ataxic disorders**
- 8A03.Z** **Ataxic disorders, unspecified**
- 8A04** **Disorders associated with tremor**  
Tremor is an involuntary oscillation of a body part and is commonly classified according to the behavioural circumstances in which it occurs. Tremor may occur during attempted relaxation (rest tremor), during a voluntarily held posture (postural tremor), or during a voluntary movement (kinetic tremor).

<b>8A04.0</b>	<b>Enhanced physiological tremor</b> This is a high frequency, low amplitude tremor present with posture or action. It represents an exacerbation of a physiologic tremor which may have been worsened by drugs, stress, anxiety, etc.
<b>8A04.1</b>	<b>Essential tremor or related tremors</b> Essential tremor is the most common form of tremor of moderate frequency ranging from 7-12 Hz and presents as a postural and kinetic tremor of the hands. It may also be present in the head/neck, and voice.  <b>Exclusions:</b> tremor NOS (8A04)
<b>8A04.2</b>	<b>Rest tremor</b> Resting tremors happen while the patient is sitting or lying down and relaxed. People who have a resting tremor can usually stop the tremor by deliberately moving the affected body part. It usually occurs in the setting of Parkinsonism.
<b>8A04.3</b>	<b>Secondary tremor</b> <b>Coding Note:</b> Code also the causing condition
<b>8A04.30</b>	Tremor due to metabolic disorders Involuntary oscillation of a body part due to metabolic disorders.  <b>Coding Note:</b> Code also the causing condition
<b>8A04.31</b>	Tremor due to chronic or acute substance use Drug use can cause tremor or exacerbate an existing tremor.  <b>Coding Note:</b> Code also the causing condition
<b>8A04.32</b>	Tremor due to drug withdrawal <b>Coding Note:</b> Code also the causing condition
<b>8A04.33</b>	Tremor due to certain specified central nervous system diseases <b>Coding Note:</b> Code also the causing condition
<b>8A04.3Y</b>	Other specified secondary tremor <b>Coding Note:</b> Code also the causing condition
<b>8A04.3Z</b>	Secondary tremor, unspecified <b>Coding Note:</b> Code also the causing condition
<b>8A04.4</b>	<b>Functional tremor</b> Functional movement disorder presenting predominantly with tremor. The tremor might be variable in frequency and distractible on testing, either entraining or ceasing in response to contralateral externally cued rhythmical movements provided by the examiner.  Functional tremor is that in which no cause has been identified after investigation.
<b>8A04.Y</b>	<b>Other specified disorders associated with tremor</b>
<b>8A04.Z</b>	<b>Disorders associated with tremor, unspecified</b>

**8A05**

### **Tic disorders**

Disorders characterized by brief, sudden, repetitive movements (motor tics) or utterances (phonic or vocal tics) that are temporarily suppressible and are usually preceded by a strong urge to perform the tic. The most common cause of childhood-onset tics is Tourette Syndrome.

**8A05.0**

### **Primary tics or tic disorders**

Primary tics or tic disorders are characterised by the presence of chronic motor and/or vocal (phonic) tics. Motor and vocal tics are defined as sudden, rapid, non-rhythmic, and recurrent movements or vocalizations, respectively. In order to be diagnosed, tics must have been present for at least one year, although they may not manifest consistently.

**8A05.00**

#### Tourette syndrome

Tourette syndrome is a chronic tic disorder characterised by the presence of both chronic motor tics and vocal (phonic) tics, with onset during the developmental period. Motor and vocal tics are defined as sudden, rapid, non-rhythmic, and recurrent movements or vocalizations, respectively. In order to be diagnosed as Tourette syndrome, both motor and vocal tics must have been present for at least one year, although they may not manifest concurrently or consistently throughout the symptomatic course.

**Inclusions:** Combined vocal and multiple motor tic disorder

**8A05.01**

#### Chronic motor tic disorder

Chronic motor tic disorder is characterised by the presence of motor tics over a period of at least one year, although they may not manifest consistently. Motor tics are defined as sudden, rapid, non-rhythmic, and recurrent movements.

**Exclusions:** Tourette syndrome (8A05.00)

**8A05.02**

#### Chronic phonic tic disorder

Chronic phonic tic disorder is characterised by the presence of phonic (vocal) tics over a period of at least one year, although they may not manifest consistently. Phonic tics are defined as sudden, rapid, non-rhythmic, and recurrent vocalizations.

**Exclusions:** Tourette syndrome (8A05.00)

**8A05.03**

#### Transient motor tics

Tics are sudden, non-rhythmic stereotyped movements such as blinking, sniffing, tapping, etc. They should have been present for less than 1 year.

**8A05.0Y**

#### Other specified primary tics or tic disorders

**8A05.0Z**

#### Primary tics or tic disorders, unspecified

**8A05.1**

### **Secondary tics**

A tic disorder as a direct physiologic consequence of an antecedent infection, drugs or illness.

**Coding Note:**

Code also the causing condition

**8A05.10** Infectious or postinfectious tics  
A tic disorder as a direct physiologic consequence of an antecedent infection.

**8A05.11** Tics associated with developmental disorders  
A tic disorder as a direct consequence of a developmental disorder.

**8A05.1Y** Other specified secondary tics  
**Coding Note:** Code also the causing condition

**8A05.1Z** Secondary tics, unspecified  
**Coding Note:** Code also the causing condition

**8A05.Y** **Other specified tic disorders**

**8A05.Z** **Tic disorders, unspecified**

## **8A06 Myoclonic disorders**

**Exclusions:** myoclonic epilepsy (8A60-8A6Z)

Facial myokymia (8B88.1)

Dystonia-plus (8A02.11)

### **8A06.0 Essential myoclonus**

This is a hereditary form of myoclonus, which is not usually associated with epilepsy or any other medical condition. Essential myoclonus tends to be stable without increasing in severity over time. More recently, it is believed that essential myoclonus may be the same as myoclonus-dystonia caused by a mutation in the sarcoglycan gene.

### **8A06.1 Segmental myoclonus**

Rhythmic or semi-rhythmic involuntary contractions of muscle groups supplied by one or more contiguous segments of the brainstem and/or spinal cord.

### **8A06.2 Focal myoclonus**

Sudden, involuntary twitching or jerking of a muscle or group of muscles which effects a localised area of the body.

### **8A06.20 Palatal myoclonus**

Palatal myoclonus is usually a rhythmic, continuous movement of the muscles of the middle ear or palate, but can also include muscle of the eye, tongue, neck and diaphragm. The movement may be present in sleep or with distraction with a frequency of 1.5 to 3 Hz. Essential palatal myoclonus is more likely to have an associated rhythmic clicking noise compared to symptomatic palatal myoclonus.

### **8A06.21 Chronic hiccups**

Chronic hiccup is a rare disorder causing repeated inspiratory spasms over periods of 48 hours or more.

### **8A06.2Y Other specified focal myoclonus**

### **8A06.2Z Focal myoclonus, unspecified**

Disorders with neurocognitive impairment as a major feature (8A20-8A2Z)

<b>8A20</b>	<b>Alzheimer disease</b>
-------------	--------------------------

**8A21****Progressive focal atrophies**

Progressive cortical atrophies are neurodegenerative diseases with progressive impairment in a single cognitive domain secondary to circumscribed cerebral atrophy.

**8A21.0****Posterior cortical atrophy**

Benson's syndrome or Posterior Cortical Atrophy (PCA) refers to a clinical syndrome in which higher order visual processing is disrupted owing to a neurodegenerative disorder. The patients present with progressive and severe visual agnosia (inability to recognize and identify familiar objects or persons) and apraxia (loss in the ability to execute or perform skilled familiar movements).

**8A21.Y****Other specified progressive focal atrophies****8A21.Z****Progressive focal atrophies, unspecified****8A22****Lewy body disease**

Lewy body disease is a neurodegenerative disorder and the second most common form of dementia in the elderly after Alzheimer disease. Lewy bodies are histologically defined as intracytoplasmic eosinophilic neuronal inclusions in the cortex or brainstem.

**8A23****Frontotemporal lobar degeneration****8A2Y****Other specified disorders with neurocognitive impairment as a major feature****8A2Z****Disorders with neurocognitive impairment as a major feature, unspecified****Multiple sclerosis or other white matter disorders (8A40-8A4Z)**

This is a group of conditions involving demyelination, damage to the myelin sheath which protects nerve axons and is responsible for neurotransmission.

**8A40****Multiple sclerosis**

Multiple Sclerosis (MS) is a chronic, inflammatory demyelinating disease of the central nervous system. Three categories of multiple sclerosis have been outlined: Relapsing/remitting, secondary progressive and primary progressive multiple sclerosis.

**Coded Elsewhere:** Retrobulbar neuritis in multiple sclerosis (9C40.1Y)

**8A40.0****Relapsing-remitting multiple sclerosis**

Clearly defined disease relapses with full recovery or with sequelae and residual deficit upon recovery. The periods between disease relapses are characterised by a lack of disease progression.

<b>8A40.1</b>	<b>Primary progressive multiple sclerosis</b> Disease progression from onset, with occasional plateaus and temporary minor improvements allowed.
<b>Coding Note:</b>	This category is to be used to indicate Primary progressive multiple sclerosis which is progressive from onset but includes progressive - relapsing, or is progressive from onset with a single relapse
<b>8A40.2</b>	<b>Secondary progressive multiple sclerosis</b>
<b>Coding Note:</b>	This category is to be used to indicate Secondary progressive multiple sclerosis, after an initially relapsing/remitting course (includes remitting relapsing progressive, may have superimposed relapses)
<b>8A40.Y</b>	<b>Other specified multiple sclerosis</b>
<b>8A40.Z</b>	<b>Multiple sclerosis, unspecified</b>
<b>8A41</b>	<b>Isolated demyelinating syndromes of the central nervous system</b> Clinically isolated syndrome (CIS) is the first clinical inflammatory demyelinating event of the central nervous system, lasting more than 24 hours. CIS is now recognised as the first clinical presentation of a disease that shows characteristics of inflammatory demyelination that could be MS, but has yet to fulfill criteria of dissemination in time.  <b>Coded Elsewhere:</b> Optic neuritis (9C40.1) Idiopathic inflammatory optic neuropathy (9C40.1Y)
<b>8A41.0</b>	<b>Transverse myelitis</b> Focal inflammatory and demyelinating disorder of the spinal cord, resulting in motor, sensory and autonomic dysfunction. Symptoms include Lhermitte's, numbness of the limbs, progressive spastic paraparesis, urinary urgency, incontinence and sexual dysfunction.  <b>Coding Note:</b> Code also the causing condition
<b>8A41.1</b>	<b>Neuromyelitis optica myelin oligodendrocyte glycoprotein antibody-positive</b> MOG antibody associated spectrum disorders are inflammatory demyelinating diseases of the central nervous system with a predilection for optic nerve that include a subgroup of patients with bilateral optic neuritis (ON), longitudinally extensive (> 3 vertebral segments) myelitis (often recurrent) and rarely patients with an NMO like presentation. The clinical and immunopathological phenotype is under active investigation
<b>8A41.Y</b>	<b>Other specified isolated demyelinating syndromes of the central nervous system</b>
<b>8A41.Z</b>	<b>Isolated demyelinating syndromes of the central nervous system, unspecified</b>

**8A42**

**Acute disseminated encephalomyelitis**

Acute disseminated encephalomyelitis is a demyelinating disorder of the central nervous system. It usually develops after acute viral or bacterial infection or vaccination, with a sudden onset of irritability and lethargy after a prodromal period of 1-4 weeks. Major symptoms include fever, headache, drowsiness, changes in mental status, seizures and coma. Weakness, vomiting, weight loss, stiff neck, ataxia, bilateral optic neuritis and delirium are common. Peripheral nervous system involvement (paralysis of a single limb or hemiplegia) may occur.

**8A42.0**

**Acute haemorrhagic leukoencephalitis**

Rare, severe, rapidly progressive inflammatory and haemorrhagic demyelinating disorder of the central nervous system, considered a variant of ADEM.

**8A42.Y**

**Other specified acute disseminated encephalomyelitis**

**8A42.Z**

**Acute disseminated encephalomyelitis, unspecified**

**8A43**

**Neuromyelitis optica**

**Coded Elsewhere:** Neuromyelitis optica myelin oligodendrocyte glycoprotein antibody-positive (8A41.1)

**8A43.0**

**Neuromyelitis optica aquaporin-4 antibody positive**

Neuromyelitis optica (NMO) is an inflammatory demyelinating disease of the central nervous system characterised mainly by attacks of uni- or bilateral optic neuritis (ON) and acute longitudinally extensive (> 3 vertebral segments) myelitis. This form is seropositive for aquaporin-4 antibodies.

**8A43.1**

**Neuromyelitis optica aquaporin-4 antibody negative**

Neuromyelitis optica (NMO) is an inflammatory demyelinating disease of the central nervous system characterised mainly by attacks of uni- or bilateral optic neuritis (ON) and acute longitudinally extensive (> 3 vertebral segments) myelitis. This form is seronegative for aquaporin-4 antibodies.

Some patients may be myelin oligodendrocyte glycoprotein (MOG) antibody positive.

**8A43.2**

**Single transverse myelitis aquaporin-4 antibody positive**

A single episode of transverse myelitis which is typically longitudinally extensive (>3 vertebral segments) associated with seropositivity for aquaporin-4 antibodies but without sufficient features to fulfill the 2006 NMO diagnostic criteria.

**8A43.3**

**Recurrent transverse myelitis aquaporin-4 antibody positive**

Two or more episodes of transverse myelitis which is typically longitudinally extensive (>3 vertebral segments) associated with seropositivity for aquaporin-4 antibodies but without sufficient features to fulfill the 2006 NMO diagnostic criteria.

**8A43.4**

**Single optic neuritis aquaporin-4 antibody positive**

A single episode of optic neuritis associated with seropositivity for aquaporin-4 antibodies but without sufficient features to fulfill the 2006 NMO diagnostic criteria.

<b>8A43.5</b>	<b>Recurrent optic neuritis aquaporin-4 antibody positive</b> Two or more episodes of optic neuritis associated with seropositivity for aquaporin-4 antibodies but without sufficient features to fulfill the 2006 NMO diagnostic criteria.
<b>8A43.Y</b>	<b>Other specified neuromyelitis optica</b>
<b>8A43.Z</b>	<b>Neuromyelitis optica, unspecified</b>
<b>8A44</b>	<p><b>Leukodystrophies</b></p> <p>Group of rare progressive genetic diseases that are caused by mutations in genes that lead to destruction of white matter of the brain by disrupting development of the myelin sheath. More than 50 different leukodystrophies have been identified, including Alexander disease, Canavan disease, cerebrotendinous xanthomatosis, metachromatic leukodystrophy, Pelizaeus-Merzbacher disease, and Refsum disease.</p> <p><b>Coded Elsewhere:</b> Metachromatic leukodystrophy (5C56.02)            Canavan disease (5C50.E1)            Leukoencephalopathy with brainstem - spinal cord involvement - lactate elevation (5C53.23)</p>
<b>8A44.0</b>	<p><b>Pelizaeus-Merzbacher disease</b></p> <p>Pelizaeus-Merzbacher disease (PMD) is an X-linked leukodystrophy characterised by developmental delay, nystagmus, hypotonia, spasticity, and variable intellectual deficit. It is classified into three sub-forms based on the age of onset and severity: connatal, transitional, and classic PMD.</p> <p><b>Coded Elsewhere:</b> Pelizaeus-Merzbacher-like disease (LD90.2)</p>
<b>8A44.1</b>	<p><b>Adrenoleukodystrophy</b></p> <p>X-linked genetic disorder associated with accumulation of very-long-chain fatty acids in the brain and adrenal cortex due to a mutation in the ABCD1 gene causing defects in peroxisomal oxidation. Neurological symptoms can present in childhood or adulthood with almost all patients having concurrent adrenal insufficiency.</p> <p><b>Coded Elsewhere:</b> Zellweger syndrome (5C57.0)            Neonatal adrenoleukodystrophy (5A74.Y)            X-linked adrenoleukodystrophy (5C57.1)</p>
<b>8A44.2</b>	<p><b>Alexander disease</b></p> <p>Alexander's disease is a neurodegenerative disorder encompassing different clinical forms: the infantile form (birth to 2 years), the most common, is characterised by its early onset and severe evolution with progressive megalecephaly (sometimes hydrocephaly), retarded psychomotor development or mental deterioration, pyramidal signs, ataxia and convulsive seizures. The juvenile forms start in school-aged children and associate spastic paraparesis and progressive bulbar signs. Adult forms are heterogeneous and difficult to diagnose.</p>

- 8A44.3 Certain specified leukodystrophies**
- Coded Elsewhere:** Phenylketonuria (5C50.0)  
Refsum disease (5C57.1)  
Cerebrotendinous xanthomatosis (5C52.11)  
Leber hereditary optic neuropathy (8C73.Y)  
Cystic leukoencephalopathy without megalecephaly (5C55.2)  
Gaucher disease (5C56.0Y)  
Niemann-Pick disease (5C56.0Y)  
Tay-Sachs disease (5C56.00)  
Oculo-dento-digital dysplasia (LD27.0Y)
- 8A44.4 Krabbe disease**
- Krabbe disease, also called globoid cell leukodystrophy, is a sphingolipidosis resulting from galactosylceramidase (or galactocerebrosidase) deficiency, a lysosomal enzyme that catabolizes a major lipid component of myelin. The disease leads to demyelination of the central and peripheral nervous system which is rapidly progressive from the first year of life, but juvenile, adolescent or adult onset forms have also been reported, with a more variable rate of progression.
- 8A44.Z Leukodystrophies, unspecified**

- 8A45.4** **White matter disorders due to certain specified systemic disease**
- 8A45.40** Demyelination due to sarcoidosis  
Sarcoidosis can affect any part of the nervous system. It is estimated that about 5-15% of cases develop evidence of central nervous system involvement. Neurosarcoidosis may manifest in many different ways, diagnosis may be difficult. Neurosarcoidosis can appear in an acute explosive fashion or as a slow, chronic illness. Any part of the central nervous system can be attacked by sarcoidosis but chronic neurosarcoidosis can cause multiple cranial nerve palsies, parenchymatous cerebral involvement, hydrocephalus and encephalopathy or peripheral nervous system manifestations.
- 8A45.41** Demyelination due to systemic lupus erythematosus  
Among the 12 systemic lupus erythematosus (SLE)-related central nervous system (CNS) syndromes defined by the American College of Rheumatology (ACR), demyelinating syndrome and myelopathy are two of the less prevalent and more poorly understood ones. One important issue concerning demyelinating disease in SLE is that it can be easily misdiagnosed with other central nervous system demyelinating disorders such as multiple sclerosis (MS).
- 8A45.42** Demyelination due to Sjögren disease

- 8A45.43** Demyelination due to Behcet disease
- 8A45.44** Demyelination due to systemic vasculitis  
The CNS vasculature can be targeted by systemic vasculitis and include the following conditions;  
Small-Medium Vessel Vasculitis - Wegener's granulomatosis, microscopic polyangiitis, Churg-Strauss syndrome, Cryoglobulinemic vasculitis and Behçet's disease.  
Medium Vessel Vasculitis - Polyarteritis nodosa  
Large Vessel Vasculitis - Giant-cell arteritis, Takayasu's arteritis (Neurologic complications are mainly due to involvement of extracranial vessels).  
Usually CNS involvement coexists with other clearly apparent systemic manifestations but some patients may present primarily with prominent symptoms of CNS dysfunction
- 8A45.45** Demyelination due to mitochondrial disease  
Mitochondrial disorders can cause multifocal and relapsing central nervous system syndromes. Mitochondrial disorders which can cause such syndromes include Mitochondrial Encephalopathy with Lactic Acidosis and Stroke (MELAS), and Leigh's disease. MELAS is a progressive neurodegenerative disorder associated with headache, treatment resistant partial seizures, short stature, muscle weakness, exercise intolerance, deafness, diabetes, and slow progressive dementia. Leigh syndrome or subacute necrotizing encephalomyopathy is the prototype mitochondrial disease, with hallmark neuroimaging findings.
- 8A45.4Z** White matter disorders due to certain specified systemic disease, unspecified
- 8A45.Y** **Other specified secondary white matter disorders**
- Coding Note:** Code also the causing condition
- 8A45.Z** **Secondary white matter disorders, unspecified**
- Coding Note:** Code also the causing condition
- 8A46** **Central demyelination of corpus callosum**  
This is demyelination, damage to the myelin sheath of neurons, in the corpus callosum.
- 8A4Y** **Other specified multiple sclerosis or other white matter disorders**
- 8A4Z** **Multiple sclerosis or other white matter disorders, unspecified**

## Epilepsy or seizures (8A60-8A6Z)

At least 2 unprovoked (or reflex) seizures occurring more than 24 hours apart.

**Coding Note:** Use additional code, if desired, to identify the type of seizure.

**Exclusions:** Syncope (MG45)

**Coded Elsewhere:** Sudden unexpected death in epilepsy (MH15)

Neonatal seizures (KB06)

**8A60**

### **Epilepsy due to structural or metabolic conditions or diseases**

Epilepsy occurring in relation to a distinct other structural or metabolic condition or disease that has been demonstrated to be associated with a substantially increased risk of developing epilepsy.

**8A60.0**

### **Epilepsy due to prenatal or perinatal brain insults**

Epilepsy occurring in relation to a distinct structural or metabolic condition or disease that has been demonstrated to be associated with a substantially increased risk of developing epilepsy, with the insult occurring before birth [prenatal] or between 22 weeks of gestation and 7 days after birth. Onset of epilepsy may be in infancy, childhood, or adulthood.

**Coding Note:**

Code also the causing condition

**Exclusions:** Neonatal seizures (KB06)

**8A60.00**

### Epilepsy due to prenatal or perinatal vascular insults

Epilepsy occurring in relation to an ischemic stroke or haemorrhagic stroke, with the stroke occurring or presumed to occur before birth [prenatal] or between 22 weeks of gestation and 7 days after birth [perinatal]. No other conditions associated with a substantially increased risk of developing epilepsy are present. Onset of epilepsy may be in infancy, childhood, or adulthood.

**Coding Note:**

Code also the causing condition

**8A60.01**

### Epilepsy due to neonatal hypoxic ischemic encephalopathy

**8A60.0Y**

### Epilepsy due to other prenatal or perinatal brain insults

**Coding Note:**

Code also the causing condition

**8A60.0Z**

### Epilepsy due to unspecified prenatal or perinatal brain insults

**Coding Note:**

Code also the causing condition

**8A60.1**

### **Epilepsy due to cerebrovascular disorders**

Epilepsy occurring in relation to a stroke, with onset at least one week following an ischemic or haemorrhagic stroke.

**Coding Note:**

Code also the causing condition

**8A60.2**

### **Epilepsy due to degenerative brain disorders**

Epilepsy in relation to a degenerative brain disorder known to be associated with seizures, such as certain neuronal storage disorders (e.g. adult neuronal ceroid lipofuscinosis), and certain mitochondrial disorders.

**Coding Note:**

Code also the causing condition

- 8A60.3      Epilepsy due to dementias**  
Epilepsy with onset in a patient with established diagnosis of dementia. Seizures may occur at any time after the disease onset. Focal onset seizures are the prevailing type in Alzheimer's disease while seizures with bilateral convulsive activity predominate in other dementing disorders. Myoclonus is another common finding in patients with Alzheimer's disease.
- Coding Note:** Code also the causing condition
- 8A60.4      Epilepsy due to central nervous system infections or infestations**  
Epilepsy with onset in a patient with a documented CNS infection or infestation after the acute phase of the disease.
- Coding Note:** Code also the causing condition
- 8A60.5      Epilepsy due to injuries to the head**  
Epilepsy occurring in relation to a traumatic brain injury. Onset is more than 1 week following the trauma, with risk increasing with the severity of brain injury.
- Coding Note:** Code also the causing condition
- 8A60.6      Epilepsy due to tumours of the nervous system**  
Epilepsy occurring in relation to intracranial tumours. The epilepsy may be the presenting symptom of the tumour, which is located within or affects the cerebral cortex. The tumour may be a primary intracranial tumour or a metastatic tumour.
- Coding Note:** Code also the causing condition
- 8A60.7      Epilepsy with mesial temporal sclerosis**  
Epilepsy associated with imaging and/or pathologic findings of mesial temporal sclerosis. Onset of epilepsy may be in childhood or adulthood. A history of prolonged febrile seizures is common.
- 8A60.8      Epilepsy due to immune disorders**  
Epilepsy in relation to immunological or autoimmune disorders, such as systemic lupus erythematosus [1], inflammatory bowel disease [2], and antibody associated encephalitis (e.g. NMDA receptors) [3]. Antibody associated encephalitis is often a limbic encephalitis, and is sometimes paraneoplastic. Excludes multiple sclerosis and other demyelinating disorders.
- Coding Note:** Code also the causing condition
- 8A60.9      Epilepsy due to abnormalities of brain development**  
Epilepsy due to disorders of cortical development encompassing a wide range of etiologies, with effects that depend on the stage of brain development. Seizure types usually reflect the topology of the malformation.
- Coding Note:** Code also the causing condition
- 8A60.A      Epilepsy due to genetic syndromes with widespread or progressive effects**  
Epilepsy due to genetically determined conditions in which, as we currently understand it, there is a separate disorder interposed between the genetic defect and the epilepsy, for example, as in tuberous sclerosis. Includes epilepsy due to documented autosomal, X-linked, mitochondrial or chromosomal abnormalities.

<b>8A60.B</b>	<b>Epilepsy due to multiple sclerosis or other demyelinating disorders</b> Epilepsy with onset in a patient with established diagnosis of multiple sclerosis (MS) or other demyelinating disorder. Seizures must occur during the disease course, but not in close temporal relationship with an acute phase. The duration of MS symptoms prior to first seizure is generally several years.
<b>Coding Note:</b>	Code also the causing condition
<b>8A60.Y</b>	<b>Epilepsy due to other structural or metabolic condition or disease</b>
<b>8A60.Z</b>	<b>Epilepsy due to unspecified structural or metabolic condition or disease</b>
<b>8A61</b>	<b>Genetic or presumed genetic syndromes primarily expressed as epilepsy</b> The epilepsy is, as best as understood, the direct result of one or more known or presumed genetic defects in which seizures are the core symptom of the disorder.
<b>8A61.0</b>	<b>Genetic epileptic syndromes with neonatal onset</b> Epilepsy with onset in the first 30 days of life resulting from one or more known or presumed genetic defects in which seizures are the core symptom of the disorder.
	<b>Exclusions:</b> Neonatal seizures (KB06) Epilepsy due to prenatal or perinatal brain insults (8A60.0)
<b>8A61.00</b>	Pyridoxal dependent epilepsy Pyridoxal 5-phosphate dependent epilepsy usually presents with neonatal intractable seizures and is diagnosed by cerebrospinal fluid (CSF) analysis, gene testing, and clinical response. The majority of patients have pyridoxamine 5'-phosphate oxidase (PNPO) gene disease causing mutations. Early diagnosis and effective treatment can lead to a relatively favourable neurodevelopmental outcome.
<b>8A61.0Y</b>	Other specified genetic epileptic syndromes with neonatal onset
<b>8A61.0Z</b>	Genetic epileptic syndromes with neonatal onset, unspecified
<b>8A61.1</b>	<b>Genetic epileptic syndromes with onset in infancy</b> Include a vast spectrum of phenotypes having in common a genetic background and the onset in infancy. They range from benign self-remitting to severe drug resistant syndromes. Family history of epilepsy is common in some syndromic entities and exceptional in others.
<b>8A61.10</b>	Benign familial infantile epilepsy Epilepsy characterised by the occurrence of repeated seizures in healthy infants with no prior medical history during the first year of life. The seizures manifest with motor arrest, impairment of consciousness, staring, eye and head deviation, and mild unilateral clonic convulsions. A family history of the same epilepsy is a constant finding. The pattern of inheritance is most probably autosomal dominant.

- 8A61.11** Dravet syndrome  
A refractory epileptic encephalopathy occurring in otherwise healthy infants during the first year of life with clonic/tonic-clonic, generalised and unilateral seizures, hemiclonic or generalised status epilepticus. The interictal EEG may initially be normal but with time background activity deteriorates and bilateral asymmetric, focal or multifocal paroxysms of polyspike and slow-waves appear. Mutations in the voltage-gated sodium channel gene SCN1A are commonly found.
- 8A61.12** Epilepsy of infancy with migrating focal seizures  
Epilepsy syndrome with onset between the first week of life and seven months of intractable, polymorphous focal seizures. Psychomotor development progressively deteriorates. A mutation of SCN1A may be found. The EEG shows multifocal, varying sites of seizure onset, and diffuse slowing.
- 8A61.1Y** Other specified genetic epileptic syndromes with onset in infancy
- 8A61.1Z** Genetic epileptic syndromes with onset in infancy, unspecified
- 8A61.2** **Genetic epileptic syndromes with childhood onset**
- 8A61.20** Benign childhood epilepsy with centro-temporal spikes  
Epilepsy characterised by focal seizures, mainly during sleep, often with involvement of the mouth and face. Convulsive seizures may occur. A history of febrile seizures is common. Onset is maximal between 7 and 10 years of age. The electroencephalogram typically shows focal epileptiform discharges over one or both centrot temporal areas. Remission occurs before age 16 years.
- 8A61.21** Childhood absence epilepsy  
Epilepsy with onset in an otherwise normal child of 2 to 12 years of age, often with multiple daily brief staring episodes lasting an average of 10 seconds. Absence seizures are usually provoked by hyperventilation. The electroencephalogram shows ictal and interictal diffuse 2.5-3 cycles per second spike and wave discharges. The genetic pattern is probably polygenic.
- 8A61.22** Epilepsy with myoclonic-astatic seizures  
Epilepsy beginning between the second and fifth year of life in a previously normal child with family history of seizures, that initially manifests as tonic-clonic seizures with myoclonic-astatic seizures beginning several weeks later. These seizures are characterised by a sudden loss of muscular tonus associated with forward or backward propulsion that may result in injury to the face and head if the patient falls.
- 8A61.23** Myoclonic absences or absences with myoclonias  
Childhood epileptic syndrome characterised by absence seizures associated with severe rhythmic bilateral myoclonic jerks. The EEG pattern shows rhythmic, bilateral, synchronous, symmetric 3-Hz spike and slow-waves discharges associated with EMG myoclonic bursts at 3 Hz, superimposed to a progressively increasing tonic contraction.
- 8A61.2Y** Other specified genetic epileptic syndromes with childhood onset
- 8A61.2Z** Genetic epileptic syndromes with childhood onset, unspecified

- 8A61.3** **Genetic epileptic syndrome with adolescent or adult onset**  
Includes a wide array of epilepsy syndromes having a (presumed) genetic origin, with onset in adolescence or in adult life. The developmental background is usually normal. Family history of epilepsy is frequently present. Focal and generalised seizures may be present most frequently in isolation to mark the diagnostic category, and rarely in combination. The interictal and ictal EEG may show typical, sometimes pathognomonic, patterns. Neuroimaging is normal although focal abnormalities are occasionally reported.
- 8A61.30** Juvenile myoclonic epilepsy  
Epilepsy with onset between the ages of 6 and 25 years with myoclonic jerks without loss of consciousness predominantly occurring early in the morning. Intelligence is not affected. Jerks may be facilitated by sleep deprivation, stress, or certain visual stimuli. Convulsive seizures may occur and may be preceded by myoclonic jerks.
- 8A61.31** Juvenile absence epilepsy  
Juvenile absence epilepsy is one of the age-related idiopathic generalised epilepsies (IGE) with an age at onset between 10 and 17 years of age, and is characterised by sporadic (non-pyknoleptic) occurrence of absence seizures frequently associated with generalised tonic-clonic seizures (GTCS) predominantly on awakening. Interictal and ictal EEG shows generalised spike and wave discharges with normal background activity.
- 8A61.32** Benign adult familial myoclonus epilepsy  
Benign adult familial myoclonic epilepsy (BAFME) is an inherited epileptic syndrome characterised by cortical hand tremors, myoclonic jerks and occasional generalised or focal seizures with a non-progressive or very slowly progressive disease course, and no signs of early dementia or cerebellar ataxia.
- 8A61.3Y** Other specified genetic epileptic syndrome with adolescent or adult onset
- 8A61.3Z** Genetic epileptic syndrome with adolescent or adult onset, unspecified
- 8A61.4** **Genetic epileptic syndromes with variable age of onset**  
Epilepsies occurring in an otherwise normal child or adult. Seizures may occur spontaneously or may be provoked by external stimuli. Family history of seizures is not uncommon and is frequently reported in selected epilepsy syndromes.  
Genetic aspects may follow differing features ranging from complex hereditary patterns to classic Mendelian features or to focused defects.
- 8A61.40** Reflex epilepsies  
Reflex epilepsies are rare epileptic syndromes with seizures induced by specific triggering factors (either by visual, auditory, somato-sensitive or somato-motor stimulation, or by higher cortical function activities). Photosensitive epilepsies are the most frequent form. Spontaneous seizures may also occur. "Reflex seizures" can be classified into a simple "pure" reflex epilepsy and a complex group. The former comprises seizure triggered by simple sensory stimuli or by movements (photosensitive epilepsies). The latter are triggered by complex mental and emotional processes (verbal and non-verbal epilepsies).

<b>8A61.41</b>	Progressive myoclonic epilepsy
<b>8A61.4Y</b>	Other specified genetic epileptic syndromes with variable age of onset
<b>8A61.4Z</b>	Genetic epileptic syndromes with variable age of onset, unspecified
<b>8A61.Y</b>	<b>Other specified genetic or presumed genetic syndromes primarily expressed as epilepsy</b>
<b>8A61.Z</b>	<b>Genetic or presumed genetic syndromes primarily expressed as epilepsy, unspecified</b>

## **8A62**

### **Epileptic encephalopathies**

Epilepsies for which no clear etiology can be detected or occurring at the presence of two or more static structural or metabolic conditions increasing the risk for epileptic seizures. The epileptic activity itself may contribute to severe cognitive and behavioural impairments above and beyond what might be expected from the underlying pathology alone.

## **8A62.0**

### **Infantile spasms**

Syndrome characterised by the subacute onset of brief, repeated seizures with axial or limb flexion, occurring in clusters. EEG shows hypsarrhythmia, i.e., chaotic, high voltage slowing multifocal spikes, with ictal abrupt decremental pattern. Various structural brain pathologies may be present, or no cause may be found. Two-thirds of children have subsequent cognitive deficits.

## **8A62.1**

### **Lennox-Gastaut syndrome**

Syndrome defined as a cryptogenic or symptomatic generalised epilepsy, which is characterised by the following symptomatic triad: several epileptic seizures (atypical absences, axial tonic seizures and sudden atonic or myoclonic falls); diffuse slow interictal spike waves in the waking EEG (< 3 Hz) and fast rhythmic bursts (10 Hz) during sleep; slow mental development associated with personality disturbances.

## **8A62.2**

### **Acquired epileptic aphasia**

Epilepsy with onset in a previously normal child characterised by acquired aphasia, variable seizure types, focal bitemporal EEG epileptiform abnormalities (1.5-5 Hz spike and slow-waves), frequently activated by sleep, with or without seizures. Behavioural disorders such as hyperactivity and attention deficit are common. There is no documented brain pathology.

## **8A62.Y**

### **Other specified epileptic encephalopathies**

## **8A62.Z**

### **Epileptic encephalopathies, unspecified**

## **8A63**

### **Seizure due to acute causes**

A clinical seizure occurring at the time of a systemic insult or in close temporal association with a documented brain insult.

#### **Coding Note:**

Code also the causing condition

**Exclusions:** Migraine aura-triggered seizures (8A80.3)

<b>8A63.0</b>	<b>Febrile seizures</b> Seizures associated with a rise of the body temperature in the absence of intracranial infection, metabolic disturbance, or history of afebrile seizures. They most commonly occur in children between the ages of 6 months and 5 years.
<b>8A63.00</b>	Simple febrile seizures Febrile seizures lasting less than 15 minutes, with no focal features and no occurrence in series.
<b>8A63.01</b>	Complex febrile seizures Febrile seizures lasting longer than 15 minutes and/or multiple episodes occurring within 24 hours and/or seizures with focal features.
<b>8A63.0Y</b>	Other specified febrile seizures
<b>8A63.0Z</b>	Febrile seizures, unspecified
<b>8A63.Y</b>	<b>Seizure due to other acute cause</b>
<b>Coding Note:</b>	Code also the causing condition
<b>8A63.Z</b>	<b>Seizure due to unspecified acute cause</b>
<b>Coding Note:</b>	Code also the causing condition
<b>8A64</b>	<b>Single seizure due to remote causes</b> An unprovoked seizure occurring in a patient with no history of antecedent seizures but with abnormalities of brain development or a potentially responsible clinical condition (metabolic, structural, toxic). The temporal relationship with the CNS insult is beyond the interval estimated for the occurrence of acute symptomatic seizures. The CNS insult may be static or progressive.  <b>Coding Note:</b> Code also the causing condition
<b>8A65</b>	<b>Single unprovoked seizure</b> A seizure occurring in the absence of a potentially responsible structural or metabolic condition or beyond the interval estimated for the occurrence of an acute symptomatic seizure.
<b>8A66</b>	<b>Status epilepticus</b> Status epilepticus is defined as 5 min or more of (i) continuous clinical and/or electrographic seizure activity or (ii) recurrent seizure activity without recovery (returning to baseline) between seizures.
<b>8A66.0</b>	<b>Convulsive status epilepticus</b> Convulsive status epilepticus is defined as 5 min or more of (i) continuous clinical convulsive seizure activity or (ii) recurrent seizure activity without recovery (returning to baseline) between seizures.
<b>8A66.1</b>	<b>Non-convulsive status epilepticus</b> Non-convulsive status epilepticus is defined as 5 min or more of (i) continuous clinical and/or electrographic seizure activity or (ii) recurrent seizure activity without recovery (returning to baseline) between seizures.

<b>8A66.10</b>	Absence status epilepticus An absence seizure (see absence seizures, typical and atypical) lasting >10 min (on average 10-15 min).
<b>8A66.1Y</b>	Other specified non-convulsive status epilepticus
<b>8A66.1Z</b>	Non-convulsive status epilepticus, unspecified
<b>8A66.Y</b>	<b>Other specified status epilepticus</b>
<b>8A66.Z</b>	<b>Status epilepticus, unspecified</b>
<b>8A67</b>	<b>Acute repetitive seizures</b> Acute repetitive seizures are multiple seizures, with a distinct time of onset, with recovery between each seizure, occurring within 24 hours in adults, or 12 hours in children.
<b>8A68</b>	<b>Types of seizures</b>
<b>Coding Note:</b>	Code also the causing condition
	<b>Exclusions:</b> Dissociative neurological symptom disorder, with non-epileptic seizures (6B60.4) Neonatal seizures (KB06)
<b>8A68.0</b>	<b>Focal unaware seizure</b> Previously termed “complex partial seizures”, define seizures originating within networks limited to one hemisphere and accompanied by loss of awareness (i.e., knowledge of self or environment).
<b>8A68.1</b>	<b>Absence seizures, atypical</b> Absence seizures with changes in tone more pronounced than in typical absences or with non-abrupt onset and/or cessation, often associated with slow, irregular, generalised spike-wave activity.
<b>8A68.2</b>	<b>Absence seizures, typical</b> Seizures characterised by sudden onset, interruption of ongoing activities, blank stare, possibly brief upward gaze deviation, unresponsiveness, duration from few seconds to half a minute, and rapid recovery. An EEG would show generalised epileptiform discharges during the event.
<b>8A68.3</b>	<b>Focal aware seizure</b> Focal aware seizures define seizures originating within networks limited to one hemisphere and accompanied by awareness (i.e., knowledge of self or environment).
<b>8A68.4</b>	<b>Generalised tonic-clonic seizure</b> A seizure characterized by an abrupt onset with loss of consciousness and bilateral tonic extension of the trunk and limbs (tonic phase) followed by synchronous muscle jerking (clonic phase). Usually followed by a postictal phase, lasting for several minutes up to hours, characterized by initial mydriasis, body relaxation, hypotonia, and sleep.

<b>8A68.5</b>	<b>Generalised myoclonic seizure</b> Seizure characterized by sudden, rapid brief (<100msec) involuntary muscle jerks that may involve just one muscle or the entire trunk musculature and are associated with an ictal EEG discharge. Can occur bilaterally, unilaterally, synchronously or asynchronously.
<b>8A68.6</b>	<b>Generalised tonic seizure</b> A seizure characterised by sustained increase in muscle contraction lasting a few seconds to minutes.
<b>8A68.7</b>	<b>Generalised atonic seizure</b> Seizure characterised by sudden loss or diminution of muscle tone without apparent preceding myoclonic or tonic event lasting 1-2 sec, involving head, trunk, jaw, or limb muscles.
<b>8A68.Y</b>	<b>Other specified type of seizure</b>
<b>Coding Note:</b>	Code also the causing condition
<b>8A68.Z</b>	<b>Type of seizure, unspecified</b>
<b>Coding Note:</b>	Code also the causing condition
<b>8A6Y</b>	<b>Other specified epilepsy or seizures</b>
<b>Coding Note:</b>	Use additional code, if desired, to identify the type of seizure.
<b>8A6Z</b>	<b>Epilepsy or seizures, unspecified</b>
<b>Coding Note:</b>	Use additional code, if desired, to identify the type of seizure.

## Headache disorders (8A80-8A8Z)

**Exclusions:** Headache, not elsewhere classified (MB4D)

<b>8A80</b>	<b>Migraine</b> A primary headache disorder, in most cases episodic. Disabling attacks lasting 4-72 hours are characterised by moderate or severe headache, usually accompanied by nausea, vomiting and/or photophobia and phonophobia, and sometimes preceded by a short-lasting aura of unilateral fully-reversible visual, sensory or other central nervous system symptoms. In a small minority of cases headache, but not necessarily the associated symptoms, becomes very frequent, with loss of episodicity.
<b>Exclusions:</b>	Headache, not elsewhere classified (MB4D)

<b>8A80.0</b>	<b>Migraine without aura</b> Recurrent headache disorder manifesting in attacks lasting 4-72 hours. The duration of attacks may be shorter in children. Typical characteristics of the headache are unilateral location, pulsating quality, moderate or severe intensity, aggravation by routine physical activity and association with nausea and/or photophobia and phonophobia.
---------------	---

- 8A80.1** **Migraine with aura**  
Recurrent attacks, lasting minutes, of unilateral fully-reversible visual, sensory or other central nervous system symptoms that usually develop gradually and are usually followed by headache and associated migraine symptoms.
- 8A80.10** **Hemiplegic migraine**  
Migraine with aura including motor weakness.
- 8A80.1Y** **Other specified migraine with aura**
- 8A80.1Z** **Migraine with aura, unspecified**
- 8A80.2** **Chronic migraine**  
Headache occurring on 15 or more days per month for more than three months, which, on at least eight days per month, has the features of migraine headache and is not associated with medication overuse.
- 8A80.3** **Complications related to migraine**
- 8A80.30** **Status migrainosus**  
A debilitating migraine attack lasting for more than 72 hours
- 8A80.3Y** **Other specified complications related to migraine**
- 8A80.4** **Cyclic vomiting syndrome**  
Recurrent episodic attacks, usually stereotypical in the individual patient, of vomiting and intense nausea. Attacks are associated with pallor and lethargy. There is complete resolution of symptoms between attacks.
- 8A80.Y** **Other specified migraine**
- 8A80.Z** **Migraine, unspecified**
- 8A81** **Tension-type headache**  
A primary and highly prevalent headache disorder, in most cases episodic. Attacks of highly variable frequency and duration are characterised by mild-to-moderate headache without associated symptoms, although pericranial tenderness may be present. In a minority of cases the disorder evolves, with increasingly frequent headache and sometimes loss of episodicity.
- Exclusions:** New daily-persistent headache (8A83)
- 8A81.0** **Infrequent episodic tension-type headache**  
Infrequent episodes of headache, typically bilateral, pressing or tightening in quality and of mild to moderate intensity, lasting minutes to days. The pain does not worsen with routine physical activity and is not associated with nausea, but photophobia or phonophobia may be present.
- 8A81.1** **Frequent episodic tension-type headache**  
Frequent episodes of headache, typically bilateral, pressing or tightening in quality and of mild to moderate intensity, lasting minutes to days. The pain does not worsen with routine physical activity and is not associated with nausea, but photophobia or phonophobia may be present.

- 8A81.2      Chronic tension-type headache**  
A disorder evolving from frequent episodic tension-type headache, with daily or very frequent episodes of headache, typically bilateral, pressing or tightening in quality and of mild to moderate intensity, lasting hours to days, or unremitting. The pain does not worsen with routine physical activity, but may be associated with mild nausea, photophobia or phonophobia.
- 8A81.Y      Other specified tension-type headache**
- 8A81.Z      Tension-type headache, unspecified**
- 8A82      Trigeminal autonomic cephalgias**  
A group of related primary headache disorders essentially characterised by unilateral headache and trigeminal autonomic activation. In most but not all of these disorders, the headache is short-lasting and very frequently recurring, but sometimes remitting for long periods.
- 8A83      Other primary headache disorder**  
A group of clinically heterogeneous headache disorders, believed to be primary. Although largely unrelated, they fall into four categories: headaches associated with physical exertion; headaches attributed to direct physical but innocuous stimuli; epicranial headaches; and other miscellaneous primary headache disorders.
- 8A84      Secondary headache**  
**Coding Note:** Code also the causing condition
- 8A84.0      Acute headache associated with traumatic injury to the head**  
Headache of less than three months' duration associated with traumatic injury to the head.
- 8A84.1      Persistent headache associated with traumatic injury to the head**  
Headache of greater than three months' duration caused by traumatic injury to the head.
- 8A84.Y      Other specified secondary headache**  
**Coding Note:** Code also the causing condition
- 8A84.Z      Secondary headache, unspecified**
- 8A85      Painful cranial neuropathies or other facial pains**  
A group of disorders characterised by head and/or facial pain, presenting variably as a neuralgia or as pain of neuropathic or central origin.  
**Coded Elsewhere:** Trigeminal neuralgia (8B82.0)  
Burning mouth syndrome (DA0F.0)
- 8A8Y      Other specified headache disorders**
- 8A8Z      Headache disorders, unspecified**

## Cerebrovascular diseases (8B00-8B2Z)

This is a group of brain dysfunctions related to disease of the blood vessels supplying the brain. This includes "stroke", which includes the following entities: Intracerebral haemorrhage; Subarachnoid haemorrhage; Cerebral ischaemic stroke; and Stroke not known if ischaemic or haemorrhagic.

**Inclusions:** Cerebrovascular disease with mention of hypertension

**Exclusions:** Intracranial injury (NA07)

**Coded Elsewhere:** Asymptomatic stenosis of intracranial or extracranial artery (BD55)

Asymptomatic occlusion of intracranial or extracranial artery (BD56)

### Intracranial haemorrhage (8B00-8B0Z)

**Coded Elsewhere:** Intracranial nontraumatic haemorrhage of fetus or newborn (KA82)

**8B00**

#### **Intracerebral haemorrhage**

Acute neurological dysfunction caused by haemorrhage within the brain parenchyma or in the ventricular system.

**Coding Note:** Code also the causing condition

**Exclusions:** sequelae of intracerebral haemorrhage (8B25.1)

Traumatic intracerebral haemorrhage (NA07.1)

**Coded Elsewhere:** Intracerebral nontraumatic haemorrhage of fetus or newborn (KA82.4)

**8B00.0**

#### **Deep hemispheric haemorrhage**

Acute neurological dysfunction caused by haemorrhage localised to the subcortex, basal ganglia, and the diencephalon (thalamus).

**Coding Note:** Code also the causing condition

**Inclusions:** Deep intracerebral haemorrhage

**8B00.1**

#### **Lobar haemorrhage**

Acute neurological dysfunction caused by haemorrhage within the lobes of the brain and outside the subcortex, basal ganglia, and the diencephalon (thalamus).

**Coding Note:** Code also the causing condition

**Inclusions:** Cerebral lobe haemorrhage

Superficial intracerebral haemorrhage

**8B00.2**

#### **Brainstem haemorrhage**

**Coding Note:** Code also the causing condition

**8B00.3**

#### **Cerebellar haemorrhage**

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Cerebellar nontraumatic, hemispheres or vermis or posterior fossa haemorrhage of fetus or newborn (KA82.6)

- 8B00.4**      **Intraventricular haemorrhage without parenchymal haemorrhage**  
                   Acute neurological dysfunction caused by haemorrhage within the ventricular system, without a component of parenchymal haemorrhage.
- Coding Note:** Code also the causing condition
- 8B00.5**      **Haemorrhage of multiple sites**  
                   Acute neurological dysfunction caused by haemorrhage of multiple sites, within the brain parenchyma, or in the ventricular system combined with haemorrhage in the brain parenchyma.
- Coding Note:** Code also the causing condition
- 8B00.Z**      **Intracerebral haemorrhage, site unspecified**  
**Coding Note:** Code also the causing condition
- 8B01**      **Subarachnoid haemorrhage**  
                   Acute neurological dysfunction caused by subarachnoid haemorrhage.  
**Exclusions:**    sequelae of subarachnoid haemorrhage (8B25.2)  
                   Traumatic subarachnoid haemorrhage (NA07.7)  
**Coded Elsewhere:** Subarachnoid nontraumatic haemorrhage of fetus or newborn (KA82.5)
- 8B01.0**      **Aneurysmal subarachnoid haemorrhage**  
**Inclusions:**    ruptured cerebral aneurysm NOS
- 8B01.1**      **Non-aneurysmal subarachnoid haemorrhage**
- 8B01.2**      **Subarachnoid haemorrhage not known if aneurysmal or non-aneurysmal**
- 8B02**      **Nontraumatic subdural haemorrhage**  
**Coding Note:** This entity is not part of the definition of stroke.  
**Exclusions:**    Traumatic subdural haemorrhage (NA07.6)  
**Coded Elsewhere:** Subdural nontraumatic haemorrhage of fetus or newborn (KA82.7)
- 8B03**      **Nontraumatic epidural haemorrhage**  
**Coding Note:** This entity is not part of the definition of stroke.
- 8B0Z**      **Intracranial haemorrhage, unspecified**

Cerebral ischaemia (8B10-8B1Z)

**Coded Elsewhere:** Neonatal cerebral ischaemia (KB00)

**8B10**

**Transient ischaemic attack**

Transient episode of focal neurological dysfunction caused by focal brain ischemia without acute infarction in the clinically relevant area of the brain or transient monocular visual loss due to retinal ischemia. Symptoms should resolve completely within 24 hours.

**Exclusions:** Neonatal cerebral ischaemia (KB00)

Transient global amnesia (MB21.12)

**8B10.0**

**Amaurosis fugax**

A transient episode of acute visual dysfunction caused by retinal ischaemia. Symptoms should resolve completely within 24 hours.

**Coding Note:** Code also the causing condition

**8B10.Y**

**Other specified transient ischaemic attack**

**8B10.Z**

**Transient ischaemic attack, unspecified**

**8B11**

**Cerebral ischaemic stroke**

Acute focal neurological dysfunction caused by focal infarction at single or multiple sites of the brain. Evidence of acute infarction may come either from a) symptom duration lasting more than 24 hours, or b) neuroimaging or other technique in the clinically relevant area of the brain. The term does not include infarction of the retina.

**Coding Note:** When the cause of ischaemic stroke is known, code to the cause. When the cause of ischaemic stroke is not known, code to 8B11.5-. When the cause of stroke is not known, code to 8B20 Stroke not known if ischaemic or haemorrhagic.

**Exclusions:** sequelae of cerebral infarction (8B25.0)

Silent cerebral infarct (8B21.0)

**8B11.0**

**Cerebral ischaemic stroke due to extracranial large artery atherosclerosis**

**Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.

**8B11.1**

**Cerebral ischaemic stroke due to intracranial large artery atherosclerosis**

**Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.

**8B11.2**

**Cerebral ischaemic stroke due to embolic occlusion**

**Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.

**8B11.20**

**Cerebral ischaemic stroke due to cardiac embolism**

**Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.

- 8B11.21** Cerebral ischaemic stroke due to aortic arch embolism
- Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.
- 8B11.22** Cerebral ischaemic stroke due to paradoxical embolism  
This is a sudden loss of brain function due to a lack of adequate blood flow. It is the result of a thromboembolism – a blood clot that detached and travelled through the blood vessels – that originated in the venous system. Because of a heart defect, it passes through to the systemic circulation system, instead of becoming lodged in the lungs.
- Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.
- 8B11.2Y** Cerebral ischaemic stroke due to other specified embolic occlusion
- Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.
- 8B11.2Z** Cerebral ischaemic stroke due to embolic occlusion, unspecified
- Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.
- 8B11.3** **Cerebral ischaemic stroke due to small artery occlusion**  
This is a sudden loss of brain function due to a lack of adequate blood flow of the small arteries.
- Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.
- 8B11.4** **Cerebral ischaemic stroke due to other known cause**
- Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.
- 8B11.40** Cerebral ischaemic stroke due to global hypoperfusion with watershed infarct  
This is a sudden loss of brain function due to a lack of adequate blood flow. It occurs in association with a low state of blood flow to the brain. The "watershed" regions of the brain, regions that are supplied by the branching ends of two large arteries, are particularly sensitive to low oxygen supply when arteries do not maintain the appropriate tension.
- Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.
- 8B11.41** Cerebral ischaemic stroke due to other non-atherosclerotic arteriopathy  
This is a sudden loss of brain function due to a lack of adequate blood flow. It is due to a disorder of the arteries, but it is neither associated with atherosclerosis nor classified elsewhere.
- Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.

<b>8B11.42</b>	Cerebral ischaemic stroke due to hypercoagulable state This is a sudden loss of brain function due to a lack of adequate blood flow. It is associated with a blood clot and a risk factor that increases blood clotting.
<b>Coding Note:</b>	If an additional code is used for anatomy, the artery affected by the stroke should be selected.
<b>8B11.43</b>	Cerebral ischaemic stroke in association with subarachnoid haemorrhage
<b>Coding Note:</b>	If an additional code is used for anatomy, the artery affected by the stroke should be selected.
<b>8B11.44</b>	Cerebral ischemic stroke from dissection
<b>Coding Note:</b>	If an additional code is used for anatomy, the artery affected by the stroke should be selected.
<b>8B11.5</b>	<b>Cerebral ischaemic stroke of unknown cause</b> This is a sudden loss of brain function due to a lack of adequate blood flow. It is of an uncertain nature, and approximately 30% of examined events fall into this category.
<b>Coding Note:</b>	If an additional code is used for anatomy, the artery affected by the stroke should be selected.
	<b>Inclusions:</b> cryptogenic stroke
<b>8B11.50</b>	Cerebral ischaemic stroke due to unspecified occlusion or stenosis of extracranial large artery This is a sudden loss of brain function due to a lack of adequate blood flow of the large extracranial arteries.
<b>Coding Note:</b>	If an additional code is used for anatomy, the artery affected by the stroke should be selected.
	<b>Exclusions:</b> Cerebral ischaemic stroke due to embolic occlusion (8B11.2) Cerebral ischaemic stroke due to other known cause (8B11.4) Cerebral ischaemic stroke due to extracranial large artery atherosclerosis (8B11.0)
<b>8B11.51</b>	Cerebral ischaemic stroke due to unspecified occlusion or stenosis of intracranial large artery This is a sudden loss of brain function due to a lack of adequate blood flow of the large intracranial arteries.
<b>Coding Note:</b>	If an additional code is used for anatomy, the artery affected by the stroke should be selected.
	<b>Exclusions:</b> Cerebral ischaemic stroke due to intracranial large artery atherosclerosis (8B11.1) Cerebral ischaemic stroke due to embolic occlusion (8B11.2) Cerebral ischaemic stroke due to other known cause (8B11.4)
<b>8B11.5Z</b>	Cerebral ischaemic stroke, unspecified
<b>Coding Note:</b>	If an additional code is used for anatomy, the artery affected by the stroke should be selected.

<b>8B1Y</b>	<b>Other specified cerebral ischaemia</b>
<b>8B1Z</b>	<b>Cerebral ischaemia, unspecified</b>
<b>8B20</b>	<b>Stroke not known if ischaemic or haemorrhagic</b> Fulfils criteria for stroke in acute symptoms of focal brain injury that have lasted 24 hours or more (or led to death before 24 hours), but subtype of stroke (ischemic or haemorrhagic) has not been determined by neuroimaging or other techniques.  <b>Exclusions:</b> sequelae of stroke (8B25.4)
<b>8B21</b>	<b>Cerebrovascular disease with no acute cerebral symptom</b> Silent cerebral infarct is defined as an infarct demonstrated on neuroimaging or at autopsy that has not caused acute dysfunction of the brain (i.e. does not qualify for diagnoses of TIA or cerebral ischemic stroke). The term "silent" denotes lack of acute symptoms.  <b>Exclusions:</b> Transient ischaemic attack (8B10) Cerebral ischaemic stroke (8B11) Intracerebral haemorrhage (8B00) Subarachnoid haemorrhage (8B01) Stroke not known if ischaemic or haemorrhagic (8B20)
<b>8B21.0</b>	<b>Silent cerebral infarct</b> Cerebral infarct that has not caused acute focal dysfunction of the brain.
<b>8B21.1</b>	<b>Silent cerebral microbleed</b> Small bleeding in the brain parenchyma that has not caused acute focal dysfunction of the brain.
<b>8B21.Y</b>	<b>Other specified cerebrovascular disease with no acute cerebral symptom</b>
<b>8B21.Z</b>	<b>Cerebrovascular disease with no acute cerebral symptom, unspecified</b>
<b>8B22</b>	<b>Certain specified cerebrovascular diseases</b> Specified other abnormalities of intracranial or extracranial arteries or veins. Entities in this section may be used in combination with other diagnostic codes in this block. Several of the entities may each cause different types of cerebrovascular disease such as TIA, cerebral ischemic stroke or intracerebral haemorrhage; may be associated with other clinical syndromes; or may be asymptomatic (not having caused acute focal dysfunction of the brain).  Section on Intracranial vascular malformations has been much revised compared to ICD-10 based on major scientific progress in this field.  Cerebral vasoconstriction syndromes and Posterior reversible encephalopathy are considered to be separate entities (as vasoconstriction is not always present in the latter).  "Progressive vascular leukoencephalopathy (Binswanger's disease)" has been removed as a separate entity.  <b>Exclusions:</b> Late effects of cerebrovascular disease (8B25)

- 8B22.0** **Dissection of cerebral arteries**  
**Exclusions:** ruptured cerebral arteries (8B01)
- 8B22.1** **Cerebral venous thrombosis**  
Thrombosis (blood clot) of the cerebral venous sinuses, which drain blood from brain  
**Exclusions:** Cerebral ischaemic stroke (8B11)  
Cerebral venous thrombosis in the puerperium (JB41.3)  
**Coded Elsewhere:** Cerebral venous thrombosis in pregnancy (JA61.5)  
Neonatal cerebral sinovenous thrombosis (KB00.1)
- 8B22.2** **Cerebral vasoconstriction syndromes**  
Cerebral vasoconstriction syndrome is characterised by severe headaches, with or without other acute neurological symptoms, and diffuse segmental constriction of cerebral arteries
- 8B22.3** **Isolated cerebral amyloid angiopathy**  
Cerebral amyloid angiopathy is characterised by the progressive accumulation of amyloid protein in the walls of small-to-medium-sized arteries and arterioles predominantly located in the leptomeningeal space, the cortex, and, to a lesser extent, also in the capillaries and veins.
- 8B22.4** **Intracranial vascular malformation**
- 8B22.40** Arteriovenous malformation of cerebral vessels
- 8B22.41** Cerebral cavernous malformation  
Cerebral cavernomas, still called cavernous angiomas, angioma cavernosum or cavernous hemangiomas, are vascular malformations in the brain that are asymptomatic or lead to seizures and/or cerebral haemorrhages. These are often found in an inheritable disorder with autosomal dominant inheritance.
- 8B22.42** Dural arteriovenous fistula  
Dural arteriovenous fistulas are formed by an abnormal connection between arteries within the dura mater and veins that normally drain the brain.
- 8B22.43** Carotid cavernous fistula  
A carotid-cavernous fistula results from an abnormal communication between the arterial and venous systems within the cavernous sinus in the skull.
- 8B22.4Y** Other specified intracranial vascular malformation
- 8B22.4Z** Intracranial vascular malformation, unspecified
- 8B22.5** **Cerebral aneurysm, nonruptured**  
**Exclusions:** Congenital cerebral nonruptured aneurysm (LA90.42)  
ruptured cerebral aneurysm (8B01.0)
- 8B22.6** **Familial cerebral saccular aneurysm**  
These are pouch-like expansions of arteries inside the skull that are familial.

<b>8B22.7</b>	<b>Cerebral arteritis, not elsewhere classified</b>
<b>8B22.70</b>	<p>Primary cerebral arteritis</p> <p>Primary cerebral arteritis (or "angiitis") results from inflammation and destruction of central nervous system (CNS) vessels without evidence of vasculitis outside the CNS</p>
<b>8B22.7Y</b>	Other specified cerebral arteritis, not elsewhere classified
<b>8B22.7Z</b>	Cerebral arteritis, not elsewhere classified, unspecified
<b>8B22.8</b>	<b>Hypertensive encephalopathy</b>
<b>8B22.9</b>	<b>Migraine-induced stroke</b>
<b>8B22.A</b>	<p><b>Subclavian steal syndrome</b></p> <p>Retrograde blood flow in the vertebral artery in the setting of ipsilateral proximal subclavian artery stenosis or occlusion leading to symptoms of basilar insufficiency.</p>
<b>8B22.B</b>	<p><b>Moyamoya syndrome</b></p> <p>A cerebrovascular disease caused by stenotic arteries at the base of the brain in the basal ganglia. Moyamoya, meaning "puff of smoke" refers to the appearance of the anastomotic vessel network formed at the base of the brain distal to the circle of Willis to compensate for the blockage.</p>
<b>8B22.C</b>	<p><b>Hereditary cerebrovascular diseases</b></p> <p>Hereditary cerebrovascular disease does not include effects from abnormalities due other vascular diseases which are independent of the nervous system.</p>
<b>8B22.C0</b>	<p>CADASIL - [cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy] syndrome</p> <p>CADASIL is the acronym for Cerebral Autosomal Dominant Arteriopathy with Subcortical Infarcts and Leukoencephalopathy. CADASIL is a genetic disease transmitted in an autosomal dominant pattern. It is associated with ischemic stroke, migraine, dementia, psychological disturbances.</p>
<b>8B22.C1</b>	<p>CARASIL - [cerebral autosomal recessive arteriopathy with subcortical infarcts and leukoencephalopathy] syndrome</p> <p>CARASIL is the acronym for cerebral autosomal recessive arteriopathy with subcortical ischaemic strokes and leukoencephalopathy.</p>
<b>8B22.CY</b>	Other specified hereditary cerebrovascular diseases
<b>8B22.CZ</b>	Hereditary cerebrovascular diseases, unspecified
<b>8B22.Y</b>	<b>Other specified cerebrovascular disease</b>

**8B23****Cerebrovascular abnormalities**

Cerebrovascular abnormalities in diseases that also involve other parts of the vascular system than intracranial and extracranial arteries, or other body systems than the nervous system.

**Coding Note:**

Code also the causing condition

**Coded Elsewhere:** Vein of Galen aneurysm (LA90.20)

Cerebral arteritis in infectious or parasitic diseases (8B22.7Y)

**8B24****Hypoxic-ischaemic encephalopathy**

Brain damage due to hypoxia-ischemia: Previous term Anoxic brain damage has been changed. The new term is now widely accepted, and better describes the pathophysiology, i.e., the combination of complete and incomplete transitory global cerebral ischemia together with a combination of anoxia and hypoxia. In a surviving patient, pure anoxic encephalopathy is very uncommon.

**Exclusions:**

complicating: surgical and medical care (NE80-NE8Z)

neonatal anoxia (KB21)

Central nervous system complications of anaesthesia during pregnancy (JA67.2)

complicating: abortion or ectopic or molar pregnancy (JA00-JA0Z)

Central nervous system complications of anaesthesia during labour or delivery (JB0C.3)

Central nervous system complications of anaesthesia during the puerperium (JB43.2)

**Coded Elsewhere:** Hypoxic ischaemic encephalopathy of newborn (KB04)

**8B24.0****Anoxic-ischaemic encephalopathy****8B24.Y****Other specified hypoxic-ischaemic encephalopathy****8B24.Z****Hypoxic-ischaemic encephalopathy, unspecified****8B25****Late effects of cerebrovascular disease**

Effects of cerebrovascular disease 1 month or later after the onset of the disease. Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

**Coding Note:**

Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.

Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

<b>8B25.0</b>	<b>Late effects of cerebral ischemic stroke</b> Late effects of cerebral ischaemic stroke 1 month or later after the onset of the disease. Codes for the acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.
<b>Coding Note:</b>	Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.  Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.
<b>8B25.1</b>	<b>Late effects of intracerebral haemorrhage</b>
<b>Coding Note:</b>	Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.  Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.
<b>8B25.2</b>	<b>Late effects of subarachnoid haemorrhage</b> Late effects of non-traumatic subarachnoid haemorrhage 1 month or later after the onset of the disease. Codes for acute haemorrhage should be exclusively used for the acute haemorrhage and immediately related hospitalisation episodes.
<b>Coding Note:</b>	Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added.  Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.  Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.
<b>8B25.3</b>	<b>Late effects of other nontraumatic intracranial haemorrhage</b> Late effects of other non-traumatic intracranial haemorrhage 1 month or later after the onset of the disease. Codes for acute episode should be exclusively used for the acute haemorrhage and immediately related hospitalisation episodes.
<b>Coding Note:</b>	Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added.  Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.  Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

<b>8B25.4</b>	<b>Late effects of stroke not known if ischaemic or haemorrhagic</b> Late effects occurring 1 month or later after the onset of the disease. Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.
<b>Coding Note:</b>	Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added.  Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.  Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.
<b>8B25.Y</b>	<b>Late effects of other specified cerebrovascular disease</b>
<b>Coding Note:</b>	Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. ### Spinal cord disorders excluding trauma (8B40-8B4Z)

**Coded Elsewhere:** Dural arteriovenous fistula (8B22.42)

Intervertebral disc degeneration (FA80)

<b>8B40</b>	<b>Cauda equina syndrome</b>
-------------	------------------------------

<b>8B41</b>	<b>Myelitis</b>
-------------	-----------------

**Coding Note:** Code also the causing condition

<b>8B42</b>	<b>Myelopathy</b>
-------------	-------------------

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Myelopathy due to nutritional deficiency (8D40.Y)

<b>8B43</b>	<b>Non-compressive vascular myelopathies</b>
-------------	--

Non-compressive spinal cord syndromes due to arterial or venous circulation anomalies.

<b>8B43.0</b>	<b>Acute arterial infarction of the spinal cord</b>
---------------	---

Acute arterial infarction of the spinal cord is due to occlusion of the anterior or posterior spinal arteries or their branches. Classical anterior spinal artery occlusion in the watershed zone in the lower cervical cord causes a specific cord syndrome with sparing of the posterior segment of the cord. Associated aortic atherosclerotic disease as well as dissection should not be overlooked.

<b>8B43.1</b>	<b>Acute venous infarction of the spinal cord</b>
---------------	---

Loss of blood flow in the venous system, leading to spinal cord infarction, commonly associated with dural fistula and dural arteriovenous malformation.

<b>8B43.2</b>	<b>Chronic venous infarction of the spinal cord</b>
---------------	---

Loss of blood flow to the spinal cord due to venous flow abnormality, leading to spinal cord infarction development over a longer period of time.

**8B43.Y**      **Other specified non-compressive vascular myelopathies**

**8B43.Z**      **Non-compressive vascular myelopathies, unspecified**

**Coded Elsewhere:** Friedreich ataxia (8A03.10)

Primary lateral sclerosis (8B60.4)

**8B44.0**      **Hereditary spastic paraplegia**

Hereditary spastic paraplegias (HSP) comprise a genetically and clinically heterogeneous group of neurodegenerative disorders characterised by varying degrees of lower limb spasticity, pyramidal weakness, hyperreflexia and hypertonic bladder involvement. Clinically, HSPs can be divided into two main groups: uncomplicated (pure) and complicated (complex) forms depending on the presence of other neurological features including ataxia, peripheral neuropathy, cognitive impairment, epilepsy, amyotrophy, retinopathy, deafness, ichthyosis and extrapyramidal involvement, in addition to spastic paraparesis. Pure HSPs are characterised by slowly progressive lower extremity spasticity and weakness, often associated with hypertonic urinary disturbances, mild reduction of lower extremity vibration sense and, occasionally, of joint position sensation. Complex HSP forms are characterised by the presence of additional neurological or non-neurological features. A positive family history particularly in autosomal dominant cases is often but not always present. The diagnosis may be aided by neuroimaging and genetic testing.

**Coded Elsewhere:** Spastic paraplegia - nephritis - deafness (LD2H.Y)

**8B44.00**      Autosomal dominant hereditary spastic paraplegia

**8B44.0Z**      Hereditary spastic paraplegia, unspecified

**8B44.Y**      **Other specified degenerative myelopathic disorders**

**8B44.Z**      **Degenerative myelopathic disorders, unspecified**

**8B4Y**      **Other specified spinal cord disorders excluding trauma**

**8B4Z**      **Spinal cord disorders excluding trauma, unspecified**

## **Motor neuron diseases or related disorders (8B60-8B6Z)**

A group of genetic disorders characterised by progressive weakness secondary to degeneration of the lower motor neurons

**8B60**

### **Motor neuron disease**

Motor neuron disease is a neurodegenerative disorder of undetermined etiology, characterised by degeneration of upper motor neurons (cortical Betz cells and corticospinal tract) or lower motor neurons (ventral horns of spinal cord and cranial nerve motor nuclei) or both. Features of involvement of lower motor neurons (LMN) are atrophy, weakness, fasciculations, hypotonia, decreased or absent deep tendon reflexes. Features of involvement of upper motor neurons (UMN) are spasticity, exaggerated deep tendon reflexes, and extensor plantar responses. Depending on the site of onset and the presence of UMN or LMN features or both, MND has varying patterns and distributions of signs and symptoms.

**Coded Elsewhere:** Brown-Vialetto-van Laere syndrome (LD2H.Y)

**8B60.0**

### **Amyotrophic lateral sclerosis**

Amyotrophic lateral sclerosis (ALS) is a progressive, fatal disorder in which progressive signs of LMN and UMN degeneration are seen within one or more of the four regions: bulbar, cervical, thoracic and lumbosacral. Electrophysiological studies may be required to confirm lower motor neuron degeneration and to exclude alternative causes. Neuroimaging may be performed to exclude other causes, which might explain the clinical and electrophysiological features. Familial ALS (FALS) of autosomal dominant inheritance constitutes 5 to 10% of ALS. The clinical profile of FALS and sporadic ALS is similar. Mutations in the C9ORF72 and Cu/Zn superoxide dismutase (SOD1) genes constitute 50-60% of FALS.

**8B60.1**

### **Progressive bulbar palsy**

Progressive bulbar palsy (PBP) is a variant of amyotrophic lateral sclerosis that initially presents with symptoms of bulbar weakness such as dysarthria and dysphagia. Symptoms may remain relatively confined to the bulbar region. PBP more commonly affects females than males. Patients typically progress to develop limb weakness and features consistent with more typical ALS at a later stage of disease.

**8B60.2**

### **Progressive pseudobulbar palsy**

Spastic speech, difficulty in swallowing, emotional lability, brisk jaw jerk, release reflexes such as palmonental reflex due to involvement of craniobulbar tracts are the common features of progressive pseudobulbar palsy. Usually mild lower motor neuron signs observed in progressive bulbar palsy may also co-exist or may develop during the progression of the disorder.

- 8B60.3** **Progressive muscular atrophy**  
In progressive muscular atrophy, lower motor neuron signs in limb and trunk muscles are present without upper motor neuron involvement. Over time, some patients may progress to develop upper motor neuron signs, of which pathological evidence is common even in patients who never displayed clinical upper motor neuron signs, suggesting that progressive muscular atrophy is a form of ALS.
- Exclusions:** Fazio-Londe syndrome (8B60)  
Amyotrophic lateral sclerosis (8B60.0)
- 8B60.4** **Primary lateral sclerosis**  
Primary lateral sclerosis (PLS) is a rare motor neuron disease variant which presents with slowly progressive UMN signs, such as spastic gait, brisk deep tendon jerks, and extensor plantar responses. Onset is most commonly with spastic paraparesis, but patients typically progress to develop upper limb and bulbar involvement. The characteristic feature of PLS is the complete absence of involvement of lower motor neuron involvement. When LMN signs develop during the course of the disease, the diagnosis will change to ALS, and they are considered a spectrum of the same disorder.
- 8B60.5** **Amyotrophic lateral sclerosis-Plus**  
This category represents a group of disorders with motor symptoms of ALS and superimposed features of dysfunction of other neurological systems, such as extrapyramidal, cerebellar or cognitive dysfunction.
- 8B60.6** **Monomelic amyotrophy**  
Atrophy and weakness restricted to one upper or lower limb, onset in the second or third decade, male predominance, and sporadic occurrence are characteristic features of MMA. Other typical features include: insidious onset of lower motor neuron signs due to anterior horn cell involvement, absence of upper motor neuron signs, slow progression followed by stabilization within a few years,, and a benign symptomatic disease course. MMA is particularly prevalent in Asia although it is encountered worldwide.
- 8B60.7** **Madras type motor neuron disease**
- 8B60.Y** **Other specified motor neuron disease**
- 8B60.Z** **Motor neuron disease, unspecified**
- 8B61** **Spinal muscular atrophy**  
Spinal muscular atrophy (SMA) is a progressive disorder with loss of anterior horn cells leading to muscle weakness and wasting. The weakness is typically symmetrical. Typically, upper motor neuron signs are absent and there is no sensory deficit. Feeding and swallowing can be affected, and involvement of respiratory muscles may occur. SMA is an autosomal recessive disorder linked to chromosome 5q13 and the disorder is caused by deletion or mutation of SMN 1 (spinal motor neuron 1) gene. The four types of SMA I, II, III and IV are categorised based on the age of onset of the disease and the ability to achieve motor milestones.

- 8B61.0 Infantile spinal muscular atrophy, Type I**  
In SMA type 1, onset of weakness may be prenatal (decreased fetal movements toward the end of pregnancy) or within the first six months of life. Infants demonstrate a characteristic frog position with the thighs externally rotated and abducted and the knees flexed (floppy infant). Bulbar weakness causes feeding difficulty. Children are never able to sit without support, and the average survival is 9 months; survival beyond 2 years is rare.
- 8B61.1 Late infantile spinal muscular atrophy, Type II**  
In SMA type 2, muscle weakness is seen between the ages of 6 to 18 months. The child can sit unsupported, but cannot stand or walk independently. Death usually occurs between 2 years of age and young adulthood.
- 8B61.2 Juvenile form spinal muscular dystrophy, Type III**  
In SMA type 3, weakness of muscles is seen after 18 months of age. The child is able to sit and stand independently. There is a limb girdle-type of distribution of weakness causing waddling gait, falls, and difficulty with running. The ability to walk may be lost, requiring a wheelchair as the disease progresses. The life expectancy may be normal.
- 8B61.3 Adult onset spinal muscular atrophy, Type IV**  
In SMA type 4 weakness, most commonly develops after 35 years of age (less commonly between 18 to 35 years old). Weakness of proximal muscles is more prominent in the legs than in the arms. Insidious onset and very slow progression are the characteristic features, and life span is normal.
- 8B61.4 Localised spinal muscular atrophy**  
This category comprises a group of disorders with a varied pattern of weakness and autosomal dominant or X-linked recessive inheritance with specific genetic profiles.
- 8B61.Y Other specified spinal muscular atrophy**
- 8B61.Z Spinal muscular atrophy, unspecified**
- 8B62 Post polio progressive muscular atrophy**  
The diagnostic criteria for Post-polio progressive muscular atrophy (PPMA) are: a credible history of poliomyelitis with partial recovery of function, a minimum 10-year period of stabilization, and the subsequent development of progressive muscle weakness. Symptoms of weakness, atrophy, and fatigue of previously affected muscles may be seen. These symptoms may also be newly noted in muscles that were apparently unaffected by the poliomyelitis episode. Muscle cramps and fasciculations may accompany the new weakness.
- Inclusions:** Post polio myelitic syndrome
- 8B6Y Other specified motor neuron diseases or related disorders**
- 8B6Z Motor neuron diseases or related disorders, unspecified**

## Disorders of nerve root, plexus or peripheral nerves (8B80-8C4Z)

- Exclusions:**
- neuritis NOS (FB56)
  - Injury of cranial nerves (NA04)
  - Injury of nerves or spinal cord at neck level (NA30-NA4Z)
  - Injury of nerves or lumbar spinal cord at abdomen, lower back or pelvis level (NB60-NB7Z)
  - Injury of nerves at shoulder or upper arm level (NC14)
  - Injury of nerves at forearm level (NC34)
  - Injury of nerves at wrist or hand level (NC55)
  - Injury of nerves at hip or thigh level (NC74)
  - Injury of nerves at lower leg level (NC94)
  - Injury of nerves at ankle or foot level (ND15)
- Coded Elsewhere:**
- Neuromyotonia (8C71.4)
  - Disorder of the optic nerve (9C40)
  - Ocular motor nerve palsies (9C81)
  - Infections of the peripheral nerves (1D0Y)

## Disorders of cranial nerves (8B80-8B8Z)

- Exclusions:**
- Disorders of acoustic nerve (AB72)
  - Disorder of the optic nerve (9C40)
- Coded Elsewhere:**
- Acute neuropathy of cranial nerve due to zoster (1E91.4)
  - Ocular motor nerve palsies (9C81)

**8B80**

### Disorders of olfactory nerve

- Inclusions:**
- Disorder of 1st cranial nerve
- Exclusions:**
- Idiopathic anosmia (MB41.0)
  - Idiopathic parosmia (MB41.1)
- Coded Elsewhere:**
- Injury of olfactory nerve (NA04.0)

**8B81**

### Disorders of vestibulocochlear nerve

- Coded Elsewhere:**
- Vestibular neuritis (AB30.0)
  - Meniere disease (AB31.0)
  - Acquired hearing impairment (AB51)
  - Acute vestibular syndrome (AB30)
  - Episodic vestibular syndrome (AB31)
  - Chronic vestibular syndrome (AB32)

**8B81.0**      **Brainstem lesion**

**8B81.Y**      **Other specified disorders of vestibulocochlear nerve**

**8B81.Z**      **Disorders of vestibulocochlear nerve, unspecified**

**8B82****Disorders of trigeminal nerve**

The trigeminal nerve is a mixed nerve with three divisions, ophthalmic, maxillary and mandibular divisions, that provides sensory innervation to the face and mucous membrane of the oral and nasal cavities and motor innervations to the muscle of mastication, tensor tympani, tensor veli palatine, mylohyoid and anterior belly of the digastric muscle. The trigeminal nuclear complex extends throughout the brainstem, hence it is susceptible to many pathologic processes including demyelination, ischemia, haemorrhage, infectious and non-infectious inflammation and neoplasm leading to symptoms of trigeminal nerve involvement. Compression of the sensory nerve root outside the brain stem by a vascular loop leads to trigeminal neuralgia. Symptoms and signs depend on the site of the lesion. In general, a trigeminal nerve disorder is associated with hemisensory facial loss, deviation of the jaw to paralysed side on opening of the mouth, and loss of the corneal reflex.

**Coded Elsewhere:** Atypical facial pain (8A85)

**8B82.0****Trigeminal neuralgia**

Trigeminal neuralgia is a manifestation of orofacial neuropathic pain restricted to one or more divisions of the trigeminal nerve. The pain is recurrent, abrupt in onset and termination, triggered by innocuous stimuli and typically compared to an electric shock or described as shooting or stabbing. Some patients experience continuous pain between these painful paroxysms.

**8B82.Z****Disorders of trigeminal nerve, unspecified****8B83****Disorders of spinal accessory nerve**

**Coded Elsewhere:** Injury of accessory nerve (NA04.A)

Lesion in jugular foramen (8B87)

**8B84****Disorders of hypoglossal nerve****8B85****Disorders of multiple cranial nerves**

This is a group of disorders of multiple cranial nerves, the twelve nerves that emerge from the brain and brainstem.

**Inclusions:** Cranial polyneuritis

**8B86****Disorders of vagus nerve**

**Exclusions:** Paralysis of vocal cords or larynx (CA0H.0)

**Coded Elsewhere:** Lesion in jugular foramen (8B87)

**8B87****Disorders of glossopharyngeal nerve**

Polyneuropathy (8C00-8C0Z)	
<b>8C00</b>	<b>Idiopathic progressive neuropathy</b>

**8C01****Inflammatory polyneuropathy**

Acquired inflammatory peripheral neuropathies are of a presumed immune etiology and are classified on the basis of their clinical course: acute inflammatory demyelinating polyneuropathy (AIDP or Guillain-Barré syndrome) with the motor deficit reaching a maximal level by 28 days, and chronic inflammatory demyelinating polyneuropathy (CIDP) which has a slowly progressive course of two or more months or a relapsing remitting course. There are many variants of AIDP and CIDP.

**8C01.0****Acute inflammatory demyelinating polyneuropathy**

Progressive weakness of the limbs over a few days to 28 days, symmetrical deficit, areflexia, absent or mild sensory disturbance, elevated cerebrospinal fluid protein, and slowing of nerve conduction velocities are the cardinal features. The disorder may be preceded by upper respiratory or gastrointestinal infection or immunization 1 to 4 weeks prior to onset of the illness. Bifacial palsy may be present.

**Inclusions:** Acute Inflammatory Demyelinating Polyradiculoneuropathy

**8C01.1****Post vaccinal neuropathy****8C01.2****Subacute inflammatory demyelinating polyneuropathy**

Subacute inflammatory demyelinating polyneuropathy (SIDP) is a subacute progressive symmetric sensorial and/or motor disorder characterised by muscular weakness with impaired sensation, absent or diminished tendon reflexes and elevated cerebrospinal fluid (CSF) proteins. SIDP is an intermediate form between Guillain-Barré syndrome (GBS) and chronic inflammatory demyelinating polyneuropathy (CIDP).

**8C01.3****Chronic inflammatory demyelinating polyneuropathy**

Chronic inflammatory demyelinating polyneuropathy is a chronic monophasic, progressive or relapsing symmetric sensorimotor disorder characterised by progressive muscular weakness with impaired sensation, absent or diminished tendon reflexes and elevated cerebrospinal fluid proteins.

## Diseases of neuromuscular junction or muscle (8C60-8D0Z)

Diseases resulting from destruction or malfunction of the neuromuscular junction, a chemical synapse formed between the end of the motor nerve terminal and the voluntary muscle. Pathology can occur at the presynaptic or postsynaptic membrane and leads to dysfunction of neuromuscular transmission. Common diseases of this category include Myasthenia Gravis and Lambert Eaton Myasthenic Syndrome.

### Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Myasthenia gravis is the most common autoimmune disease affecting the neuromuscular junction and is characterised by painless fatigable muscle weakness. It is caused by autoantibodies against neuromuscular junction proteins, either the nicotinic acetylcholine receptor (AChR) or the muscle specific tyrosine kinase (MuSK). Mutations in neuromuscular junction proteins cause congenital myasthenic syndromes. Other antibodies mediated conditions affecting the neuromuscular junction, including Lambert Eaton myasthenic syndrome and neuromyotonia.

**Coded Elsewhere:** Botulism (1A11)

Neuromuscular junction disorders due to toxicity (NE61)

**8C60**

### Myasthenia gravis

Myasthenia gravis is the most common acquired auto-antibody mediated neuromuscular transmission disorder. Prevalence is 1–2 per 10,000 persons. Fluctuating weakness increasing with repeated activity and improving after a period of rest is the hallmark. Myasthenia Gravis with antibodies directed against postsynaptic proteins, usually the nicotinic acetylcholine receptor are the most prevalent. Other types are Myasthenia Gravis associated with muscle-specific kinase antibodies and MG with unknown autoantibodies (seronegative) Myasthenia Gravis.

There are three groups: 1. Purely ocular Myasthenia Gravis

2. Early-onset (<40-50 years) generalised Myasthenia Gravis

3. Late-onset generalised MG.

In about 15%, the disease can be classified as paraneoplastic, usually associated with a thymoma.

**Coded Elsewhere:** Transient neonatal myasthenia gravis (KB08.0)

**8C60.0**

### Drug-induced myasthenia gravis

Some drugs can have clear effects on Myasthenia Gravis, including Neuromuscular junction blockers, antibiotics, prednisone, chloroquine, D-penicillamine, interferons, and others. In rapid-onset drug-induced Myasthenia Gravis, myasthenic signs develop within days which rapidly disappear after drug withdrawal. Anti-Acetylcholinesterase antibodies are absent. This disorder may unmask a pre-existing neuromuscular transmission disorder or may exacerbate pre-existing Myasthenia Gravis, i.e. subclinical Myasthenia Gravis becomes manifest after drug treatment, or known MG becomes more severe. Certain drugs are linked with aggravation of Myasthenia Gravis, including pain management medications, tricyclic antidepressants and some antiepileptic medications, and should be used with caution.

**8C60.Y**

### Other specified myasthenia gravis

8C60.Z	<b>Myasthenia gravis, unspecified</b>
8C61	<b>Congenital myasthenic syndromes</b> Congenital myasthenic syndrome is a heterogeneous group of genetically determined diseases. There are four well-defined categories: Congenital myasthenic syndrome with presynaptic defect, Synaptic basal lamina-associated CMS, Congenital myasthenia with postsynaptic defect, CMS with glycosylation deficiency, and the remaining category is that of unidentified CMS.
8C62	<b>Lambert-Eaton syndrome</b> Lambert-Eaton myasthenic syndrome, 20 times as rare as acetylcholine receptor positive myasthenia gravis with a prevalence of 3.42 per million, is an immune-mediated disease of the neuromuscular junction. Clinically the disease is characterised by proximal weakness of the legs. In most patients, the weakness extends to other muscles including the oculobulbar ones. Autonomic symptoms (dry mouth, erectile dysfunction, constipation) are frequent. Tendon reflexes are reduced. Repetitive nerve stimulation shows low compound muscle action potentials, decrement > 10% at low frequency and increment > 100% after maximum voluntary contraction at high frequency.
8C6Y	<b>Other specified myasthenia gravis and neuromuscular junction disorders</b>
8C6Z	<b>Unspecified myasthenia gravis or neuromuscular junction disorders</b>

Primary disorders of muscles (8C70-8C7Z)

Disorders in which the primary symptom of muscle weakness is secondary to a specific dysfunction of a muscle fiber.

**Exclusions:** Metabolic disorders (5C50-5D2Z)

Arthrogryposis multiplex congenita (LD26.41)

**Coded Elsewhere:** Idiopathic rhabdomyolysis (FB32.20)

Idiopathic inflammatory myopathy (4A41)

8C70	<b>Muscular dystrophy</b> Progressive, hereditary skeletal muscle diseases characterised by muscle weakness, wasting, defects in muscle proteins, necrosis of muscle tissue and replacement of muscle tissue with connective and fatty tissue.
	<b>Coded Elsewhere:</b> Muscular dystrophy affecting extraocular muscle (9C82.1) Barth syndrome (5C50.E0) Epidermolysis bullosa simplex with muscular dystrophy (EC30)

8C70.0	<b>Becker muscular dystrophy</b>
--------	----------------------------------

- 8C70.1 Duchenne muscular dystrophy**  
Duchenne muscular dystrophy (DMD) is a severe X-linked myopathy caused by mutation in the dystrophin gene with symptoms appearing before the age of 6 with a rapid disease progression. Symptoms may include fatigue, learning difficulties (the IQ can be below 75), Muscle weakness, problems with motor skills, frequent falls and progressive difficulty walking.
- 8C70.2 Emery-Dreifuss muscular dystrophy**  
Emery-Dreifuss muscular dystrophy (EDMD) is a muscle disease characterised by muscular weakness and atrophy, with early contractures of the tendons and cardiac involvement (arrhythmias, cardiomyopathy).
- 8C70.3 Facioscapulohumeral muscular dystrophy**  
Facioscapulohumeral muscular dystrophy (FSHD) is an autosomal dominantly inherited muscle disease characterised by progressive muscle weakness with initial focal involvement of the facial, shoulder and arm muscles.
- 8C70.4 Limb-girdle muscular dystrophy**  
Limb-girdle muscular dystrophy (LGMD) constitutes a group of genetically determined, progressive disorders of muscles, in which the pelvic or shoulder girdle musculature is predominantly or primarily involved. It may be inherited in an autosomal recessive or dominant fashion.
- 8C70.40 Dominant limb-girdle muscular dystrophy**  
The Limb Girdle Muscular Dystrophies (LGMD) are a group of genetic disorders characterised predominantly by progressive wasting and weakness of proximal limb girdle muscles, including pelvic, shoulder, upper arm and thigh muscles. The onset symptoms usually vary from early childhood to late adulthood, and the progression rate and distribution of weakness and wasting also varies considerably among individuals and genetic subtypes. There are currently 8 autosomal dominant LGMDs (LGMD1), linked to specific gene mutations. Dominant LGMDs are often allelic with other clinical disorders, including the myofibrillar myopathies or dilated cardiomyopathy.
- Exclusions:** Secondary myopathies (8C80-8C8Z)  
Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

- 8C70.41** Recessive limb-girdle muscular dystrophy  
 Autosomal recessive limb girdle muscular dystrophies (LGMD2) are a group of genetically heterogeneous diseases that are typically characterised by progressive weakness and wasting of the shoulder and pelvic girdle muscles. Many of the more than 20 different conditions show overlapping clinical features with other forms of muscular dystrophy, congenital, myofibrillar or even distal myopathies and also with acquired muscle diseases. Although individually extremely rare, all types of LGMD2 together form an important differential diagnostic group among neuromuscular diseases.
- Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)  
 Secondary myopathies (8C80-8C8Z)
- 8C70.4Y** Other specified limb-girdle muscular dystrophy
- 8C70.4Z** Limb-girdle muscular dystrophy, unspecified
- 8C70.5** **Scapuloperoneal muscular dystrophy**  
 Scapuloperoneal muscular dystrophies are a group of genetically heterogeneous myopathies characterised by progressive weakness and wasting of scapular and anterior leg muscles. Emery-Dreifuss muscular dystrophy is a classic scapuloperoneal muscular dystrophy associated with early contractures and cardiac arrhythmia, but other muscle disorders can also present with a scapuloperoneal phenotype.
- Exclusions:** Secondary myopathies (8C80-8C8Z)  
 Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)
- 8C70.6** **Congenital muscular dystrophy**  
 Congenital muscular dystrophies with central nervous system abnormalities are a heterogeneous group of autosomal recessively inherited degenerative muscle disorders associated with cerebral and cerebellar dysplasia, white matter abnormalities and ocular abnormalities in some subtypes.
- 8C70.Y** Other specified muscular dystrophy
- 8C70.Z** Muscular dystrophy, unspecified
- 8C71** **Myotonic disorders**  
 Group of inherited muscular disorders associated with clinical and/or electrical myotonia. Myotonia is defined clinically as the occurrence of “delayed relaxation of muscle after voluntary contraction or percussion.”

**8C71.0**

**Myotonic dystrophy**

Myotonic dystrophy is a group of inherited muscular disorders. It is the most common form of muscular dystrophy that begins in adulthood. Myotonic dystrophy is characterised by progressive muscle wasting and weakness, and prolonged muscle contractions (myotonia) that are not able to relax after use. Other signs and symptoms of myotonic dystrophy include slurred speech or temporary locking of their jaw, cataracts and cardiac conduction defects. In affected men, hormonal changes may lead to early balding and infertility. The clinical severity varies widely among affected patients, even among members of the same family.

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

**Coded Elsewhere:** Myotonic cataract (9B10.2Y)

**8C71.1**

**Chondrodystrophic myotonia**

Schwartz-Jampel syndrome is a congenital myotonic syndrome characterised by myotonia that results in a characteristic facies with blepharophimosis and a puckered facial appearance, and osteoarticular abnormalities leading to limited joint mobility.

**8C71.2**

**Myotonia congenita**

Thomsen and Becker disease are myotonic disorders characterised by slow muscle relaxation associated with hyperexcitation of the muscle fibres occurring within the first few months after birth. The myotonia is unusual in that it is relieved by exercise (warm-up effect). Autosomal dominant myotonia congenita (Thomsen disease) is a non-dystrophic muscle disorder caused by mutation in the gene encoding skeletal muscle chloride channel-1 (CLCN1). It is clinically characterised by muscle stiffness and an inability of the muscle to relax after voluntary contraction. Autosomal recessive myotonia congenita (Becker disease) is caused by mutation in the gene encoding skeletal muscle chloride channel-1 (CLCN1). It is a non-dystrophic skeletal muscle disorder characterised by muscle stiffness and an inability of the muscle to relax after voluntary contraction. Most patients have symptom onset in the legs, which later progresses to the arms, neck, and facial muscles. Many patients show marked hypertrophy of the lower limb muscles. Transient muscle weakness is a characteristic feature.

**8C71.3**

**Drug-induced myotonia**

Drug-induced myotonia refers to the myotonia-inducing effects of certain drugs. Hypocholesterolaemic agents may induce myotonia by altering the sterol composition of the muscle cell membrane, while other drugs including beta-adrenergic blockers and agonists, succinylcholine and diuretics may exacerbate or unmask pre-existing myotonia.

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

<b>8C71.4</b>	<b>Neuromyotonia</b> Neuromyotonia or Isaac's syndrome is an immune-mediated peripheral nerve disorder characterised by continuous muscle fibre activity at rest resulting in muscle stiffness, cramps, myokymia, and pseudomyotonia.
<b>8C71.5</b>	<b>Pseudomyotonia</b> The term pseudomyotonia (slow relaxation of muscles after voluntary contraction) describes the clinical appearance of myotonia in the absence of myotonic discharges on the electromyography. Pseudomyotonia is most commonly observed as the slow-relaxing or "hung-up" tendon reflexes of hypothyroidism, although other causes are described. Pseudomyotonia is seen in about one-third of patients with Isaacs syndrome, particularly with handgrip, but also after eye and jaw closure; rarely, this can be the first symptom.  <b>Exclusions:</b> Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)  Secondary myopathies (8C80-8C8Z)
<b>8C71.Y</b>	<b>Other specified myotonic disorders</b>
<b>8C71.Z</b>	<b>Myotonic disorders, unspecified</b>
<b>8C72</b>	<b>Congenital myopathies</b>
<b>8C72.0</b>	<b>Congenital myopathy with structural abnormalities</b> Distinct group of inherited disorders of skeletal muscles which have characteristic structural abnormalities on muscle immuno-histochemistry.  <b>Coding Note:</b> Code also the causing condition  <b>Exclusions:</b> Secondary myopathies (8C80-8C8Z)  Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)
<b>8C72.00</b>	Nemaline myopathy Nemaline myopathy encompasses a large spectrum of congenital myopathies characterised by hypotonia, weakness and depressed or absent deep tendon reflexes, with pathologic evidence of nemaline bodies (rods) on muscle biopsy.
<b>8C72.01</b>	Centronuclear myopathy Centronuclear myopathy (CNM) is an inherited neuromuscular disorder characterised by clinical features of a congenital myopathy and centrally placed nuclei on muscle biopsy. It encompasses the X-linked form, the autosomal recessive form and the autosomal dominant form with a highly variable clinical presentation.
<b>8C72.02</b>	Central core disease Central core disease (CCD) is an inherited neuromuscular disorder characterised by central cores on muscle biopsy and clinical features of a congenital myopathy (hypotonia and motor developmental delay) and is characterised by predominantly proximal weakness, pronounced in the hip girdle.

<b>8C72.0Y</b>	Other specified congenital myopathy with structural abnormalities
<b>Coding Note:</b>	Code also the causing condition
<b>8C72.0Z</b>	Congenital myopathy with structural abnormalities, unspecified
<b>Coding Note:</b>	Code also the causing condition
<b>8C72.1</b>	<b>Congenital myopathy with no structural abnormalities</b>
	<b>Exclusions:</b> Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)
	Secondary myopathies (8C80-8C8Z)
<b>8C72.Y</b>	<b>Other specified congenital myopathies</b>
<b>8C72.Z</b>	<b>Congenital myopathies, unspecified</b>
<b>8C73</b>	<b>Mitochondrial myopathies</b>
	Mitochondrial myopathies are heterogeneous group of disorders caused by dysfunction of mitochondrial oxidative phosphorylation and can be classified according to the associated biochemical, genetic defects (in the mitochondrial DNA or in nuclear encoded proteins) or clinical phenotype. Exclude: defects of mitochondrial respiratory chain, Kearns-Sayre syndrome, myoclonic epilepsy with ragged red fibres (MERRF)
	<b>Coded Elsewhere:</b> Leigh syndrome (5C53.24)
	Progressive external ophthalmoplegia (9C82.0)
<b>8C73.0</b>	<b>Autosomal recessive cardiomyopathy or ophthalmoplegia</b>
	Autosomal recessive cardiomyopathy and ophthalmoplegia is a childhood-onset disease characterised by progressive external ophthalmoplegia, mild facial and proximal limb weakness, and severe cardiomyopathy. Muscle biopsies show ragged-red and cytochrome C oxidase-negative fibres; the activities of several complexes in the electron-transport chain are decreased. The combination of progressive external ophthalmoplegia, cardiomyopathy, and multiple mtDNA deletions is thought to be due to a defect of communication between the nuclear and mitochondrial genomes.
	<b>Exclusions:</b> Secondary myopathies (8C80-8C8Z)
	Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)
<b>8C73.1</b>	<b>Neuropathy, ataxia, and retinitis pigmentosa</b>
	Neuropathy, Ataxia, and Retinitis Pigmentosa (NARP) syndrome is a clinically heterogeneous oxidative phosphorylation disorder often characterised by a combination of sensory-motor neuropathy, cerebellar ataxia, and night blindness.
<b>8C73.Y</b>	<b>Other specified mitochondrial myopathies</b>
<b>8C73.Z</b>	<b>Mitochondrial myopathies, unspecified</b>

**8C74****Periodic paralyses or disorders of muscle membrane excitability**

These are a group of disorders caused by malfunctioning of the ion channels in skeletal muscle membranes causing the cells to depolarize leading to weakness or paralysis. The common triggers include cold, heat, high carbohydrate meals, stress, excitement, physical exertion etc.

**8C74.0****Paramyotonia congenita**

Paramyotonia congenita of Von Eulenburg is a skeletal muscle disease characterised by exercise- or cold-induced myotonia and muscle weakness.

**8C74.1****Periodic paralysis**

Rare group of neuromuscular disorders that are associated with defects in ion channels. Characterized by intermittent episodes of severe weakness of the limbs usually after heavy exercise, fasting, or high carbohydrate meals. The three major types of inherited periodic paralysis include hypokalemic periodic paralysis, hyperkalemic periodic paralysis, and Andersen–Tawil syndrome.

**8C74.10****Hypokalaemic periodic paralysis**

Hypokalaemic periodic paralysis (hypoPP) is a muscle channelopathy characterised by episodes of muscle paralysis lasting from a few to 24-48 hours and associated with a fall in blood potassium levels.

**Coded Elsewhere:** Thyrotoxic periodic paralysis (5A02.Y)

**8C74.11****Hyperkalaemic periodic paralysis**

Hyperkalaemic periodic paralysis (HyperPP) is a muscle disorder characterised by episodic attacks of muscle weakness associated with an increase in serum potassium concentration.

**Coded Elsewhere:** Long QT syndrome type 7 (BC65.0)

**8C74.1Y****Other specified periodic paralysis****8C74.1Z****Periodic paralysis, unspecified****8C74.Y****Other specified periodic paralyses or disorders of muscle membrane excitability****8C74.Z****Periodic paralyses or disorders of muscle membrane excitability, unspecified****8C75****Distal myopathies**

Distal myopathies are heterogeneous group of myopathies characterised clinically by progressive weakness and atrophy starting in distal muscles and progressing to proximal ones, and histologically by nonspecific myopathic features on muscle biopsy.

**8C76**

### **Myofibrillar myopathy**

Myofibrillar myopathies are a heterogeneous group of disorders, characterised by the pathologic finding of myofibrillar disruption on electron microscope with a spectrum of histological abnormalities including excessive desmin accumulation in muscle fibres.

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

**8C77**

### **Ocular myopathy**

Slowly progressive weakness of ocular muscles, usually characterised by decreased mobility of the eye and drooping of the upper lid. The disorder may be unilateral or bilateral, and may be caused by central or peripheral nervous system lesion or by a neuromuscular disease.

**Exclusions:** Ocular myopathy with mitochondrial abnormalities (9C82.0)  
oculopharyngeal muscular dystrophy (9C82.1)  
Ocular muscular dystrophy (9C82.1)

**8C78**

### **Malignant hyperthermia or hyperpyrexia**

Malignant hyperthermia is a pharmacogenetic disorder of skeletal muscle that presents as a hypermetabolic response to potent volatile anaesthetic gases such as halothane, sevoflurane, desflurane and the depolarizing muscle relaxant succinylcholine, and rarely in humans, to stresses such as vigorous exercise and heat. May be caused by a mutation in the Ryonadine Receptor 1 gene.

**8C7Y**

### **Other specified primary disorders of muscles**

**8C7Z**

### **Primary disorders of muscles, unspecified**

Secondary myopathies (8C80-8C8Z)

This is a group of conditions in which the muscle fibres are dysfunctional, resulting in muscle weakness. The myopathy is caused by an underlying disorder.

**Exclusions:** Arthrogryposis multiplex congenita (LD26.41)  
Ischaemic infarction of muscle (FB32.2)

**Coded Elsewhere:** Alcoholic myopathy (8D44.1)

Myopathy due to toxicity (8D43.3)

**8C80**

### **Drug-induced myopathy**

Myopathy caused by drugs that ranges from mild myalgias with or without mild weakness to chronic myopathy with severe weakness, to massive rhabdomyolysis with acute renal failure. It could be due to several different mechanisms including direct myotoxicity, immune mediated and indirect muscle damage through drug-induced coma, drug-induced hypokalaemia, drug-induced hyperkinetic states or dystonic states.

**8C81****Autoimmune myopathy**

Autoimmune myopathy is a subgroup of idiopathic inflammatory myopathies, which, despite diverse causes, have the common histopathological features of myocyte necrosis without significant inflammation. Patients present with a subacute severe symmetrical proximal myopathy, associated with a markedly elevated creatine kinase level. These are most likely immune-mediated, as they respond to immunotherapy. It is often accompanied by statin therapy, connective tissue diseases, cancer, and autoantibodies specific for signal recognition particle (SRP) or 3-hydroxy-3-methylglutaryl-coenzyme A reductase (HMGCR).

**Coding Note:**

Code also the causing condition

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

**8C82****Myopathy in certain specified infectious or parasitic disease**

Myopathy in certain specified infectious or parasitic disease is an uncommon group of muscle diseases caused by a broad range of bacterial, fungal, parasitic, and viral agents. Bacterial organisms cause pyomyositis, psoas abscess, Staphylococcus aureus myositis, group A streptococcal necrotizing myositis, group B streptococcal myositis, clostridial gas gangrene, and nonclostridial myositis. Fungal myositis is rare and usually occurs among immunocompromised hosts. Parasitic myositis is most commonly a result of trichinosis or cysticercosis, but other protozoa or helminths may be involved. Viruses may cause benign acute myositis, pleurodynia, acute rhabdomyolysis, or an immune-mediated polymyositis.

**Coding Note:**

Code also the causing condition

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

**8C83****Myopathy in certain specified endocrine disease**

Myopathy in certain specified endocrine disease refers to muscle disorders associated with adrenal dysfunction (as steroid myopathy), thyroid dysfunction (as in myxoedema coma or thyrotoxic myopathy), parathyroid dysfunction (as in multiple endocrine neoplasia), pituitary dysfunction, and islands of Langerhans dysfunction (as in diabetic myopathy from ischemic infarction of the femoral muscles). Steroid myopathy is the most common endocrine myopathy. These conditions are usually reversible with correction of the underlying endocrine disturbance.

**Coding Note:**

Code also the causing condition

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

**8C84****Secondary rhabdomyolysis**

Secondary rhabdomyolysis occurs when the primary effect of a aetiological factor results in a functional or biochemical state which is conducive to the development of ischemic, degenerative, necrotic or membrane destabilizing changes in muscle, producing the clinical and biochemical features of rhabdomyolysis. Most frequently, rhabdomyolysis is secondary to a metabolic derangement often genetic in nature, as result of abnormally excessive movement, excessive isometric tension by attempted movement against resistance, or coma leading to increased intramuscular pressure, ischemia, hypoxia and necrosis. Secondary rhabdomyolysis can also be caused by a mutation in various genes (RYR1, LPIN).

**Coding Note:** Code also the causing condition

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

**8C8Y****Other specified secondary myopathies**

**Coding Note:** Code also the causing condition

**8C8Z****Secondary myopathies, unspecified**

**Coding Note:** Code also the causing condition

**8D0Y****Other specified diseases of neuromuscular junction or muscle****8D0Z****Diseases of neuromuscular junction or muscle, unspecified****Cerebral palsy (8D20-8D2Z)**

**Exclusions:** Hereditary spastic paraplegia (8B44.0)

**8D20****Spastic cerebral palsy**

Spastic cerebral palsy is characterised by increased muscle tone associated with hyperactive muscle stretch reflexes (deep tendon reflexes) and an increase in resistance to rapid muscle stretch. Extensor plantar responses are commonly present.

**8D20.0****Spastic unilateral cerebral palsy**

Spastic unilateral cerebral palsy is a form of cerebral palsy in which the spasticity is confined to one side; it is often accompanied by cortical sensory impairment and varying degrees of hemineglect, demonstrable by testing stereognosis and graphesthesia. Early hand preference is often the first sign of this disorder, and may be apparent in the first months of life.

**8D20.1****Spastic bilateral cerebral palsy**

- 8D20.10** Spastic quadriplegic cerebral palsy  
Spastic quadriplegic cerebral palsy is a form of cerebral palsy in which spasticity is generalised, yet most marked in the legs. Opisthotonic posturing is often apparent in infancy, and head movement may elicit forced extension of the arms and legs. Suprabulbar palsy is often present, causing impaired swallowing and articulation ('spastic dysarthria').
- Inclusions:* Spastic tetraplegic cerebral palsy
- 8D20.11** Spastic diplegic cerebral palsy  
Spastic diplegic cerebral palsy is a form of cerebral palsy in which spasticity is most marked in the legs, with mild, if any, involvement of the arms.
- 8D20.1Z** Spastic bilateral cerebral palsy, unspecified
- 8D20.Y** Other specified spastic cerebral palsy
- 8D20.Z** Spastic cerebral palsy, unspecified
- 8D21** **Dyskinetic cerebral palsy**  
Dyskinetic cerebral palsy, also known as extrapyramidal cerebral palsy is characterised by impairment of voluntary movement because of the presence of interfering involuntary movements, and inappropriate co-contraction of agonist and antagonist muscles (dystonia). This group of disorders includes choreoathetotic cerebral palsy and dystonic cerebral palsy. The former is characterised by large amplitude, involuntary movements of mainly distal limbs (athetosis) with or without small amplitude, fleeting, asymmetric contractions of individual muscle groups (chorea).
- Dystonic cerebral palsy predominantly affects proximal trunk and limb muscles, which may show slow, persistent movements, leading to the adoption of unusual postures, such as torticollis.
- Inclusions:* Athetoid cerebral palsy
- 8D22** **Ataxic cerebral palsy**  
Ataxic cerebral palsy is dominated by signs of cerebellar dysfunction, including hypotonia, ataxia, dysdiadochokinesis, dysmetria, dysarthria and nystagmus. Reflexes may be pendular, although there are often also signs of spasticity.
- 8D23** **Worster-Drought syndrome**  
Worster-Drought syndrome (WDS) is a form of cerebral palsy characterised by congenital pseudobulbar (suprabulbar) paresis manifesting as selective weakness of the lips, tongue and soft palate, dysphagia, dysphonia, drooling and jaw jerking.
- 8D2Y** Other specified cerebral palsy
- 8D2Z** Cerebral palsy, unspecified

**Nutritional or toxic disorders of the nervous system (8D40-8D4Z)**

**8D40      Neurological disorders due to nutrient deficiency**

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Dementia due to pellagra (6D85.8)

White matter disorders due to nutritional deficiency (8A45.3)

Dementia due to nutritional deficiency (6D85.Y)

**8D41.Z      Neurological disorders due to an excess of micro or macro nutrients, unspecified**

**Coding Note:** Code also the causing condition

**8D42****Neurological disorders due to overweight or obesity in adults or children**

Neurological disorders that arise from the metabolic dysfunction, inflammation, and dyslipidemia caused by overweight ( $BMI > 25$ ) or obese ( $BMI > 30$ ) status. Examples include mild cognitive impairment secondary to hippocampal alteration, hypothalamic dysfunction, autonomic dysfunction, peripheral polyneuropathy, and obstructive sleep apnea.

**Coding Note:**

Code also the causing condition

**8D43****Neurological disorders due to toxicity**

**Coded Elsewhere:** Neuromuscular junction disorders due to toxicity (NE61)

Intracranial hypertension associated with medication or toxin exposure (8D60.Y)

Myelopathy due to toxicity (8B42)

**8D43.0****Encephalopathy due to toxicity****8D43.00**

Encephalopathy due to ammonia

**8D43.0Y**

Other specified encephalopathy due to toxicity

**8D43.0Z**

Encephalopathy due to toxicity, unspecified

**8D43.1****Cognitive impairment due to toxicity**

These are conditions of impaired cognition due to the toxicity of substances.

**Coded Elsewhere:** Dementia due to exposure to heavy metals and other toxins (6D85.2)

Dementia due to carbon monoxide poisoning (6D84.Y)

Post radiation dementia (6D84.Y)

Dementia or parkinsonism due to manganese toxicity (6D84.Y)

**8D43.2****Neuropathy due to toxicity**

In considering the diagnosis of toxic neuropathy, two criteria should be met: (1) Exposure can be verified and temporally related to the onset of clinical symptoms. Neuropathic symptoms usually occur concurrently with the exposure or following a variable latency of up to several months. (2) There must be neurological signs and abnormal electrodiagnostic studies, because many toxic neuropathies are subclinical, subjective symptoms may or may not occur. Removal from exposure results in cessation of progression of symptoms and the deficit. Most toxins produce symmetrical axonal degeneration in a length-dependent pattern, beginning in the distal segments of the long and large-calibre nerve fibres eventually spreading proximally with continued exposure. In addition to motor and/or sensory deficits, severe pain may be a characteristic feature.

**Coded Elsewhere:** Alcoholic polyneuropathy (8D44.0)

**8D43.20**

Drug-induced polyneuropathy

**8D43.21**

Post radiation polyneuropathy

**8D43.2Y**

Other specified neuropathy due to toxicity

- 8D43.2Z** Neuropathy due to toxicity, unspecified
- 8D43.3** **Myopathy due to toxicity**  
*Coded Elsewhere:* Alcoholic myopathy (8D44.1)  
Myopathy due to other toxic agents (8C8Y)
- 8D43.4** **Movement disorders due to toxicity**  
Movements of the body such as hyperkinesias, dyskinesias, myoclonus, chorea, tremor and tics produced by toxicity either by toxin or drug, e.g. toxicity by manganese, neuroleptic drugs, calcium channel blockers, gastrointestinal prokinetics, antiarrhythmics and antidepressants that may induce Parkinsonism.  
*Coded Elsewhere:* Toxin-induced parkinsonism (8A00.2Y)  
Chorea due to toxins (8A01.1Y)  
Dystonia due to toxins (8A02.1Y)  
Ataxia due to certain specified toxins (8A03.3Y)
- 8D43.5** **Cassava poisoning**  
Symmetrical, non-progressive, non-remitting spastic paraparesia occurring in epidemic and endemic forms with a predilection for children and young women. The unknown aetiology is related to consumption of bitter cassava roots with very minimal protein supplementation.  
*Coded Elsewhere:* Myelopathy due to konzo (8B42)
- 8D43.Y** **Other specified neurological disorders due to toxicity**
- 8D43.Z** **Neurological disorders due to toxicity, unspecified**
- 8D44** **Alcohol-related neurological disorders**  
*Coded Elsewhere:* Dementia due to use of alcohol (6D84.0)
- 8D44.0** **Alcoholic polyneuropathy**
- 8D44.1** **Alcoholic myopathy**  
Myopathy secondary to alcohol use and includes acute and chronic alcoholic myopathy. Several forms have been described: acute necrotizing myopathy, acute hypokalaemic myopathy, chronic alcoholic myopathy, asymptomatic alcoholic myopathy, and alcoholic cardiomyopathy.
- 8D44.Y** **Other specified alcohol-related neurological disorders**
- 8D44.Z** **Alcohol-related neurological disorders, unspecified**
- 8D4Y** **Other specified nutritional or toxic disorders of the nervous system**
- 8D4Z** **Nutritional or toxic disorders of the nervous system, unspecified**

## Disorders of cerebrospinal fluid pressure or flow (8D60-8D6Z)

- 8D60** **Increased intracranial pressure**  
An increase in pressure within the skull caused by changes in the volumes of the intracranial components, such as brain matter, CSF and blood, or by the presence of a pathological mass entity.
- 8D60.0** **Brain herniation syndromes**  
The shift or displacement of brain tissue due to mass effect from its normal location to a region it does not occupy.
- 8D60.1** **Cerebral oedema**  
Is an excess accumulation of fluid in the intracellular and/or extracellular spaces of the brain.  
**Exclusions:** Traumatic cerebral oedema (NA07.2)  
Cerebral oedema due to birth injury (KA40.1)
- 8D60.Y** **Other specified increased intracranial pressure**
- 8D60.Z** **Increased intracranial pressure, unspecified**
- 8D61** **Intracranial hypotension**  
The syndrome of intracranial hypotension is a single pathophysiological entity of diverse origin. Usually it is characterised by an orthostatic headache, one that occurs or worsens with upright posture. Patients with chronic headaches and asymptomatic patients have been described.
- 8D61.0** **Spontaneous intracranial hypotension**  
The exact cause of spontaneous spinal CSF leaks usually remains unknown, but a combination of an underlying weakness of the spinal meninges and a trivial precipitating event is generally suspected.
- 8D61.1** **Secondary intracranial hypotension**  
**Coding Note:** Code also the causing condition
- 8D61.Y** **Other specified intracranial hypotension**
- 8D61.Z** **Intracranial hypotension, unspecified**
- 8D62** **Cerebrospinal fluid rhinorrhoea**
- 8D63** **Cerebrospinal fluid otorrhoea**
- 8D64** **Hydrocephalus**  
**Coded Elsewhere:** Neonatal hydrocephalus (KB05)
- 8D64.0** **Communicating hydrocephalus**  
Communicating hydrocephalus, also known as non-obstructive hydrocephalus, is a disorder characterised by impaired cerebrospinal fluid reabsorption in the absence of any CSF-flow obstruction between the ventricles and subarachnoid space.

- 8D64.00** Increased cerebrospinal fluid production  
Is a type of communicating hydrocephalus caused by increased CSF production.
- 8D64.01** Congenital agenesis of arachnoid villi
- 8D64.02** Post haemorrhagic hydrocephalus
- 8D64.03** Post traumatic hydrocephalus
- 8D64.04** Normal-pressure hydrocephalus  
A clinical syndrome mainly comprising gait disturbance, dementia, and urinary incontinence, and associated with dilatation of the ventricular system of the brain. Most of the times demonstrating normal cerebrospinal fluid (CSF) pressure at lumbar puncture.
- 8D64.0Y** Other specified communicating hydrocephalus
- 8D64.0Z** Communicating hydrocephalus, unspecified
- 8D64.1** **Non-communicating hydrocephalus**  
It represents a form of hydrocephalus where there is an excessive accumulation of CSF within the ventricles caused by blockage of its pathway and due to several causes.  
**Coded Elsewhere:** Neonatal obstructive hydrocephalus (KB05.0)
- 8D64.10** Hydrocephalus due to structural malformations  
Ventricular enlargement due to an accumulation of cerebrospinal fluid secondary to obstruction caused by a structural abnormality such as Chiari malformations or aqueductal stenosis.  
**Coded Elsewhere:** Dandy-Walker malformation with hydrocephalus (LA06.0)
- 8D64.1Y** Other specified non-communicating hydrocephalus
- 8D64.1Z** Non-communicating hydrocephalus, unspecified
- 8D64.2** **Ex-vacuo hydrocephalus**  
Hydrocephalus ex-vacuo occurs when there is damage to the brain caused by stroke, injury, or radiation, and there may be an actual shrinkage of brain substance. Although there is more CSF than usual, the CSF pressure itself is normal in hydrocephalus ex-vacuo.
- 8D64.Z** **Hydrocephalus, unspecified**
- 8D65** **Cerebrospinal fluid fistula**  
Cerebrospinal fluid fistula is a condition in which the cerebrospinal fluid (CSF) held in and around the human brain and spinal cord leaks out of the surrounding protective sac, the dura, for no apparent reason or due to several pathological processes.

**8D66****Syringomyelia or syringobulbia**

In syringomyelia, there is fluid-filled tubular cavitation (syrinx formation) within the central spinal cord. The syrinx can elongate, enlarge and expand into the grey and white matter and, as it does so, it compresses the nervous tissue of the corticospinal and spinothalamic tracts and the anterior horn cells. This leads to the various neurological symptoms and signs. If the syrinx extends into the brainstem, syringobulbia results.

**Exclusions:** Congenital hydromyelia (LA07.3)

**8D66.0****Idiopathic syringomyelia**

A condition in which the syrinx has no identifiable cause and which is difficult to treat. Most large and/or symptomatic syrinxes can be treated with syrinx shunting.

**8D66.1****Syringomyelia due to certain specified cause**

A condition when the syrinx is associated with an underlying cause.

**Coding Note:**

Code also the causing condition

**8D66.2****Syringobulbia**

Chronic progressive degenerative disorder of the CNS characterized by the formation of a fluid filled cavity known as a syrinx in the spinal cord that extends upwards to involve the medulla and pons. May occur in isolation or may also occur secondary to neoplasms, traumas, deformities of the craniocervical junction or meningitis.

**8D66.Y****Other specified syringomyelia or syringobulbia****8D66.Z****Syringomyelia or syringobulbia, unspecified****8D67****Intracranial arachnoid cyst**

A fluid filled cavity within the arachnoid membrane which may be congenital or acquired. Acquired causes include trauma, infection and surgery. The most common site is the middle cranial fossa. Factors that influence whether the cyst causes symptoms include its size and location. Symptoms if present may include headache, dizziness, nausea and vomiting, seizures, developmental delay

**8D68****Porencephalic cyst**

Cavity within the cerebral hemisphere that communicates directly with the ventricular system. Ischemic necrosis in utero or later in life can cause the adjacent ventricular region to expand into the stroke cavity forming, forming a cyst.

**8D6Y****Other specified disorders of cerebrospinal fluid pressure or flow****8D6Z****Disorders of cerebrospinal fluid pressure or flow, unspecified**

## Disorders of autonomic nervous system (8D80-8D8Z)

This is a group of conditions characterised as being in or associated with the autonomic nervous system, the

component of the peripheral nervous system that regulates involuntary physiologic processes.

**Inclusions:** Disorder of parasympathetic nervous system

**Coded Elsewhere:** Paroxysmal autonomic disorders

Hypohidrosis (EE01)

**8D80** **Congenital malformations of the autonomic nervous system**

**8D81** **Inherited autonomic nervous system disorders**

**8D82** **Autoimmune disorders involving the autonomic nervous system**

**8D83** **Autonomic nervous system disorder due to infection**

**Coding Note:** Code also the causing condition

**8D84** **Pure autonomic nervous system failure**

Pure autonomic failure is a sporadic, adult onset, slowly progressive disorder associated with accumulation of synuclein in peripheral autonomic neurons resulting in orthostatic hypotension, bladder and sexual dysfunction.

**8D85** **Autonomic nervous system disorder due to substances**

**Coded Elsewhere:** Neuroleptic malignant syndrome (8A0Y)

**8D86** **Autonomic nervous system hyperactivity**

**8D87** **Autonomic nervous system disorder due to certain specified neurodegenerative disorder**

**8D87.0** **Multiple system atrophy**

Multiple system atrophy (MSA) is a rare neurodegenerative disorder characterised by varied combinations of parkinsonian, cerebellar, autonomic (erectile dysfunction, bladder dysfunction, orthostatic hypotension) and pyramidal features. The disease belongs to the group of alpha-synucleinopathies, a group of diseases characterised by aggregation of alpha-synuclein in affected brain regions. There are two different types: MSA-P (with parkinsonism) and MSA-C (with cerebellar dysfunction).

**8D87.00** Multiple system atrophy, Cerebellar type

**8D87.01** Multiple system atrophy, Parkinsonism

This is a progressive disorder of the central and autonomic nervous systems, characterised by orthostatic hypotension (an excessive drop in blood pressure when standing up), which causes dizziness or fainting. It can occur without orthostatic hypotension, but instead have urinary involvement (urgency/incontinence). This type includes symptoms of Parkinson's disease such as slow movement, rigidity, and tremor.

**Exclusions:** Spinocerebellar ataxia (8A03.16)

Pure autonomic nervous system failure (8D84)

<b>8D87.0Y</b>	Other specified multiple system atrophy
<b>8D87.0Z</b>	Multiple system atrophy, unspecified
<b>8D87.Y</b>	<b>Other specified autonomic nervous system disorder due to specified neurodegenerative disorder</b>
<b>8D88</b>	<b>Autonomic neuropathies</b>
	<b>Coded Elsewhere:</b> Hereditary sensory or autonomic neuropathy (8C21)
<b>8D88.0</b>	<b>Autonomic neuropathy due to sodium channelopathies</b>
	<b>Coded Elsewhere:</b> Paroxysmal extreme pain disorder (8E43.Y)
	Primary erythromelalgia (EG00)
	Secondary erythromelalgia (EG00)
<b>8D88.1</b>	<b>Autonomic neuropathy due to diabetes mellitus</b>
	Dysfunction of the autonomic nervous system due to diabetes mellitus that presents as functional complications such as resting tachycardia, exercise intolerance, orthostatic hypotension, constipation, gastroparesis, sweating, bladder distention, and impotence.
<b>Coding Note:</b>	Always assign an additional code for diabetes mellitus.
<b>8D88.2</b>	<b>Immune mediated autonomic neuropathy</b>
<b>Coding Note:</b>	Code also the causing condition
<b>8D88.3</b>	<b>Autonomic disorder due to toxins</b>
<b>8D88.4</b>	<b>Autonomic neuropathy in endocrine and metabolic diseases</b>
<b>Coding Note:</b>	Code also the causing condition
<b>8D88.Y</b>	<b>Other specified autonomic neuropathies</b>
<b>8D88.Z</b>	<b>Autonomic neuropathies, unspecified</b>
<b>8D89</b>	<b>Disorders of orthostatic tolerance</b>
	Disorders characterized by symptomatic arterial hypotension (lightheadedness, fatigue) when assuming an upright position usually due to dysfunction of adrenergic regulation.
	<b>Coded Elsewhere:</b> Orthostatic hypotension (BA21)
<b>8D89.0</b>	<b>Reflex syncope</b>
	Reflex syncope is a transient loss of consciousness with spontaneous recovery and associated with loss of postural tone. Reflex syncope is the most common form of syncope and can occur in individuals with normal autonomic function. The mechanism is believed to be related to blood pooling in the legs followed by reduction in blood return to the heart which triggers a sympathetic tone increase. Vigorous cardiac contractions with an underfilled ventricle are hypothesized to cause reflex loss of sympathetic tone and vagotonia.
<b>8D89.1</b>	<b>Syncope due to autonomic failure</b>

- 8D89.2 Postural orthostatic tachycardia syndrome**  
Postural Orthostatic Tachycardia Syndrome is a type of chronic orthostatic intolerance lasting three months or longer associated with excessive upright tachycardia in the absence of orthostatic hypotension, plus a constellation of typically daily symptoms which may include lightheadedness, dizziness, nausea, dyspnoea, diaphoresis, headache, fatigue and other symptoms of autonomic dysfunction. Excessive tachycardia is defined by present consensus as a heart rate increase of at least 30 beats per minute in adults (40 beats per minute for adolescents), or a heart rate greater than 120 beats per minute, within 10 minutes of upright tilt table testing.
- 8D89.3 Baroreflex failure**
- 8D89.Y Other specified disorders of orthostatic tolerance**
- 8D89.Z Disorders of orthostatic tolerance, unspecified**
- 8D8A Focal or segmental autonomic disorders**  
*Coded Elsewhere:* Trigeminal autonomic cephalgias (8A82)  
Hyperlacrimation (9A10.3)  
Underproduction of tears (9A10.4)
- 8D8A.1 Horner syndrome**
- 8D8A.2 Episodic anisocoria**  
This is a group of disorders in which periodic pupillary movements lead to changes in size. These are due to abnormal parasympathetic or sympathetic tone.
- 8D8A.Y Other specified focal or segmental autonomic disorders**
- 8D8A.Z Focal or segmental autonomic disorders, unspecified**
- 8D8B Disorders affecting autonomic synaptic neurotransmission**  
*Coded Elsewhere:* Aromatic L-amino acid decarboxylase deficiency (5C59.00)  
Dopamine beta-hydroxylase deficiency (5C59.00)  
Autosomal recessive dopa-responsive dystonia (8A02.11)  
Menkes disease (5C64.0Y)
- 8D8C Autonomic dysreflexia**  
This is a potentially dangerous disorder associated with damage to the spinal cord above the sixth thoracic level characterized by a marked increase in the sympathetic response to minor stimuli. It leads to sudden severe hypertension which can be life-threatening.
- 8D8D Hypoglycaemia unawareness**  
Hypoglycemia unawareness is defined at the onset of neuroglycopenia before the appearance of autonomic warning symptoms
- 8D8Y Other specified disorders of autonomic nervous system**
- 8D8Z Disorders of autonomic nervous system, unspecified**

## **Human prion diseases (8E00-8E0Z)**

Human prion diseases or transmissible spongiform encephalopathies are rare transmissible diseases affecting the central nervous system. The infectious agents are composed of an abnormal isoform of a host membrane protein called 'prion protein' (PrP). Their common features are a long duration of incubation and lesions limited to the central nervous system without inflammatory or immunologic reaction but with accumulation of an abnormal form of prion protein (PrPsc).

**8E00**

### **Sporadic Creutzfeldt-Jakob Disease**

A disease of the brain, that is associated with a mutation of normal prion protein genes or spontaneous transformation of prion proteins. This disease is characterised by a long incubation period, progressive dementia, neurological deficits, and is fatal. Transmission may be by direct contact with infected nervous tissue or blood. Confirmation is by pathological examination of the brain.

**8E01**

### **Acquired prion disease**

Environmentally acquired prion diseases are prion diseases caused by a known source of abnormal prion protein.

**8E01.0**

### **Iatrogenically acquired Creutzfeldt-Jakob Disease**

Iatrogenically acquired Creutzfeldt-Jakob Disease (iCJD) is CJD acquired by medical procedures, medicines, medicinal materials, or devices.

**8E01.1**

### **Kuru**

A disease of the nervous system, caused by a prion. This disease is characterised by limb pain, ataxia, tremors, decreased coordination, or emotional changes, and is fatal. Transmission is by ingestion of infected human brain, or direct contact. Confirmation is commonly by clinical signs, or pathological examination of the brain.

**8E01.2**

### **Variant Creutzfeldt-Jakob Disease**

A disease of the brain, that is suspected to be caused by a prion associated with Bovine Spongiform Encephalopathy. This disease is characterised by a long incubation period, psychiatric symptoms followed by neurological deficits, and is fatal. Transmission may be by ingestion of food (with a bovine origin) contaminated with infected brain or spinal cord from an infected cow, or blood transfusion. Confirmation is by pathological examination of the brain.

**8E01.3**

### **Other acquired Creutzfeldt-Jakob Disease**

There have been cases of Creutzfeldt-Jakob Disease (CJD) associated with neurosurgical procedures and stereotactic electroencephalogram (EEG) electrode placement on the brain, particularly in the 1950s to 1970s when the transmissibility of prions was not yet recognised.

**8E01.Z**

### **Acquired prion disease, unspecified**

**8E02**

### **Genetic prion diseases**

**8E02.0**

### **Genetic Creutzfeldt-Jakob disease**

A disease of the brain, that is associated with a prion. This disease is characterised by neurological deficits, and is fatal. Confirmation is by pathological examination of the brain.

- 8E02.1**           **Gerstmann-Straussler-Scheinker syndrome**  
A disease caused by inheritance of mutation(s) in normal prion protein genes. This disease is characterised by cerebellar ataxia, decreased coordination, dysmetria, or dysarthria, and is fatal. Confirmation is by pathological examination of the brain and genetic testing.
- Exclusions:**       Gerstmann syndrome (MB4C)
- 8E02.2**           **Fatal familial insomnia**  
A disease of the brain, caused by inheritance of mutation(s) of normal prion protein genes. This disease is characterised by severe insomnia and autonomic system dysfunction, and is fatal. Confirmation is by pathological examination of the brain and genetic testing.
- 8E02.3**           **Other genetic prion diseases**
- 8E02.Y**           **Other specified Creutzfeldt-Jakob disease**
- 8E02.Z**           **Creutzfeldt-Jakob disease, unspecified**
- 8E03**           **Variably protease sensitive prionopathy**  
A disease of the brain, caused by a mutation(s) in prion protein genes. This disease is characterised by deposition of abnormal prions in the brain leading to behavioural and mood changes, speech deficits, and progressive motor impairments. Confirmation is by pathological examination of the brain or identification of protease-sensitive prion proteins in a brain sample.
- 8E0Y**           **Other specified human prion diseases**
- 8E0Z**           **Human prion diseases, unspecified**

## Disorders of consciousness (8E20-8E2Z)

**Coded Elsewhere:** Delirium (6D70)

Coma (MB20.1)

- 8E20**           **Persistent vegetative state**  
Subacute or chronic state of severe disturbance of consciousness lasting at least a month, characterised by the recovery of cyclic arousal states mimicking sleep/wake cycles after a severe brain injury. Patients with this condition are unresponsive and show no evidence of awareness of themselves or their environment. Cardiopulmonary and visceral autonomic regulation is maintained by the brainstem.

- 8E21**           **Permanent vegetative state**  
Prognostic term applied to patients in a persistent vegetative state for whom no recovery is expected.

<b>8E22</b>	<b>Minimally conscious state</b> Subacute or chronic state of severely disturbed consciousness in which patients show minimal yet definite signs of consciousness, such as visual pursuit or command following, occurring after a severe brain injury. These patients do not show functional communication or functional use of objects.
<b>8E22.0</b>	<b>Minimally conscious state plus</b> Subcategory of patients in a minimally conscious state who show signs of command following.
<b>8E22.1</b>	<b>Minimally conscious state minus</b> Subcategory of patients in a minimally conscious state who show signs of non-reflex behaviour such as eye tracking, orientation to pain, or contingent responses to specific emotional stimuli but without command following.
<b>8E22.Y</b>	<b>Other specified minimally conscious state</b>
<b>8E22.Z</b>	<b>Minimally conscious state, unspecified</b>
<b>8E2Y</b>	<b>Other specified disorders of consciousness</b>
<b>8E2Z</b>	<b>Disorders of consciousness, unspecified</b>

## Other disorders of the nervous system (8E40-8E4Y)

**Coded Elsewhere:** Brain death (MH10)

Neurosarcoidosis (4B20.3)

<b>8E40</b>	<b>Disorders of the meninges excluding infection</b>
	<b>Coded Elsewhere:</b> Postprocedural meningitis (8E62)

<b>8E40.0</b>	<b>Neoplastic meningitis</b>
	Inflammation of the meninges due to malignant infiltration from carcinomas, leukaemias and lymphomas. The syndrome is clinically characterised by headache, neck stiffness, fever and photophobia with potential progression to stupor and coma. The presentation may be acute, subacute or chronic. Diagnosis may be aided by neuroimaging and spinal fluid analysis which may reveal a lymphocytic pleocytosis, raised protein and the presence of malignant cells on cytology.

**Coding Note:** Code also the causing condition

<b>8E40.1</b>	<b>Chemical meningitis</b>
<b>8E40.2</b>	<b>Inflammatory meningitis</b>

A general term to describe a group of disorders in which there is Inflammation of the meninges due to an underlying inflammatory disorder. The syndrome is clinically characterised by headache, neck stiffness, fever and photophobia. Other central and peripheral nervous system manifestations may be present. Non-neurological features, including skin, eye and organ involvement may also be present. Diagnosis may be aided by serological testing, neuroimaging and if appropriate a tissue biopsy. Spinal fluid analysis may reveal a lymphocytic pleocytosis, a raised protein and the presence of oligoclonal bands.

- 8E40.3 Arachnoiditis**  
Arachnoiditis is a chronic inflammation of the arachnoid layer of the meninges, of which adhesive arachnoiditis is the most severe form, characterised by debilitating, intractable neurogenic back and limb pain and a range of other neurological problems.
- 8E40.Y Other specified disorders of the meninges excluding infection**
- 8E40.Z Disorders of the meninges excluding infection, unspecified**
- 8E41 Pachymeningitis**  
Inflammation of the pachymeninges resulting in localised or diffuse thickening of the dura mater which can be caused by chronic infection, inflammatory and immune-mediated disorders and malignancies. The cranial and/or the spinal dura may be affected. Neurological features include headache, visual disturbance, cranial nerve palsies, ataxia and with spinal involvement, limb weakness, sensory impairment and sphincter disturbances . Diagnosis may be aided by neuroimaging and spinal fluid analysis.
- 8E41.0 Pachymeningitis due to infection**  
Inflammation of the pachymeninges resulting in localised or diffuse thickening of the dura mater caused by chronic infection such as tuberculosis. The cranial and/or the spinal dura may be affected. Neurological features include headache, visual disturbance, cranial nerve palsies, ataxia and, with spinal involvement, limb weakness, sensory impairment and sphincter disturbances. Diagnosis may be aided by neuroimaging, spinal fluid analysis and dural biopsy.
- 8E41.1 Idiopathic hypertrophic pachymeningitis**  
Inflammation of the pachymeninges resulting in localised or diffuse thickening of the dura mater for which no identifiable cause is found. The cranial and/or the spinal dura may be affected. Neurological features include headache, visual disturbance, cranial nerve palsies, ataxia and with spinal involvement, limb weakness, sensory impairment and sphincter disturbances. Diagnosis may be aided by neuroimaging and spinal fluid analysis and dural biopsy.
- 8E41.Y Other specified pachymeningitis**
- 8E41.Z Pachymeningitis, unspecified**
- 8E42 Superficial siderosis of the nervous system**  
Superficial siderosis is the deposition of haemosiderin in the central nervous system as a result of chronic or recurrent subarachnoid haemorrhage due to vascular anomalies, aneurysms, vascular tumours, neurosurgery, cervical root lesions, head injury and trauma. Clinical feature of Superficial siderosis include sensorineural deafness, cerebellar ataxia, pyramidal weakness and less frequently dementia, loss of sphincter control, anosmia, anisocoria, sensory disturbance, extra-ocular motor palsies, sciatica and lower motor neuron signs. The diagnosis may be confirmed by pure tone audiometry, neuroimaging, spinal fluid analysis, angiography to identify a potential bleeding source and where appropriate genetic testing.

**8E43****Pain disorders**

**Exclusions:** Chronic neuropathic pain (MG30.5)

**8E43.0****Neuropathic pain**

Neuropathic pain is described as electric, burning, or shock like, caused by metabolic, nutritional, infectious, genetic, autoimmune, and/or vasculitic processes. The pain may occur spontaneously, without provocation, or be provoked by noxious or nonnoxious stimuli. Pain is characteristic of small fibre neuropathy, but even in large fibre neuropathies, a sufficient number of small fibres may be damaged to cause pain. Neuropathic pain usually affects distal skin and subcutaneous structures. The pain may be constant or intermittent, and may be described as searing, burning, or icy cold.

Complex regional pain syndrome follows trauma and comprises regional pain, sensory changes, abnormalities of temperature, sudomotor activity, colour changes of the skin, and oedema.

**Exclusions:** Chronic neuropathic pain (MG30.5)

**8E43.00****Phantom limb syndrome**

Phantom limb pain is the perception of sensations, including pain, in a limb that has been amputated or a body part that has been removed. These sensations may include a specific position, shape, or movement of the phantom, feelings of warmth or cold, itching, tingling, or electric sensations, and other paraesthesiae.

**8E43.0Y****Other specified neuropathic pain****8E43.0Z****Neuropathic pain, unspecified****8E43.Y****Other specified pain disorders****8E43.Z****Pain disorders, unspecified****8E44****Post anoxic brain damage**

Post anoxic brain damage refers to the variable severity of encephalopathy that results from circulatory arrest, hypotension or asphyxia.

**8E45****Locked-in syndrome****8E46****Reye syndrome**

Reye syndrome is sudden (acute) brain damage (encephalopathy) and liver function problems of unknown cause. The syndrome has occurred with the use of aspirin to treat chickenpox or the flu in children. However, it has become very uncommon since aspirin is no longer recommended for routine use in children. Reye syndrome often begins with vomiting, which lasts for many hours. The vomiting is quickly followed by irritable and aggressive behaviour. There is no specific treatment for this condition. The health care provider will monitor the pressure in the brain, blood gases, and blood acid-base balance (pH).

**8E47**

**Encephalopathy, not elsewhere classified**

Global brain dysfunction

**Coding Note:**

Code also the causing condition

**Coded Elsewhere:** Neonatal encephalopathy (KB03)

**8E48**

**Encephalitis, not elsewhere classified**

**8E49**

**Postviral fatigue syndrome**

**Inclusions:** chronic fatigue syndrome

myalgic encephalomyelitis

**Exclusions:** Fatigue (MG22)

**8E4A**

**Paraneoplastic or autoimmune disorders of the nervous system**

Paraneoplastic and autoimmune disorders of the nervous system result from a targeted immune attack on neurons or glial cells in the central (e.g. encephalopathy, ataxia, myelitis) or peripheral nervous systems (peripheral or autonomic neuropathies, neuromuscular junction disorders or myopathy). In the paraneoplastic context, this attack is a consequence of a potentially effective tumour immune response initiated by onco-neural antigens derived from a systemic cancer. In the non-paraneoplastic context termed autoimmune the etiology remains elusive though increasing evidence indicates a preceding infectious trigger in at least some cases. These disorders are commonly multifocal causing injury and symptoms arising from involvement at many levels of the nervous system. A personal or family history of autoimmunity is often found. Accompanying neural and non-organ specific (thyroid peroxidase [TPO] antibodies) autoantibodies may be found. The neural autoantibody profile may be predictive of a specific cancer type and may be associated with a particular neurological phenotype. Exclusion of alternative etiologies (e.g. infections) is important. Response to immunotherapy may support the diagnosis.

**Coding Note:**

Code also the causing condition

**8E4A.0 Paraneoplastic or autoimmune disorders of the central nervous system, brain or spinal cord**

Paraneoplastic and autoimmune disorders of the central nervous system, brain and spinal cord nervous system result from a targeted immune attack on neurons or glial cells in the central (e.g. encephalopathy, ataxia, myelopathy, myelitis) nervous system. In the paraneoplastic context, this attack is a consequence of a potentially effective tumour immune response initiated by onco-neural antigens derived from a systemic cancer. In the non-paraneoplastic context termed 'autoimmune' the etiology remains elusive though increasing evidence indicates a preceding infectious trigger in at least some cases. These disorders are commonly multifocal causing injury and symptoms arising from involvement at many levels of the central nervous system. A personal or family history of autoimmunity is often found. Accompanying neural and non-organ specific (thyroid peroxidase [TPO] antibodies) autoantibodies may be found. The neural autoantibody profile may be predictive of a specific cancer type and may be associated with a particular neurological phenotype. Exclusion of alternative etiologies (e.g. infections) is important. Response to immunotherapy may support the diagnosis.

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Paraneoplastic retinopathy (9B71.4)

Autoimmune retinopathy (9B71.5)

Opsoclonus-myoclonus (9C85.02)

**8E4A.1 Paraneoplastic or autoimmune disorders of the peripheral or autonomic nervous system**

Paraneoplastic and autoimmune disorders of the peripheral and autonomic nervous system result from a targeted immune attack on neurons or glial cells in the peripheral nervous systems (peripheral or autonomic neuropathies). In the paraneoplastic context, this attack is a consequence of a potentially effective tumour immune response initiated by onco-neural antigens derived from a systemic cancer. In the non-paraneoplastic context termed autoimmune the etiology remains elusive though increasing evidence indicates a preceding infectious trigger in at least some cases. Onset may be subacute or insidious and these disorders may be limited, multifocal or generalised. Autoimmune somatic peripheral nerve disorders may affect the nerve at multiple levels including root, nerve and plexus and may be axonal, demyelinating or both. Autoimmune autonomic disorders result in autonomic failure that can be partial or generalised. The prototypic autonomic neuropathy is the autoimmune ganglionopathy associated with

antibodies targeting the ganglionic nicotinic acetylcholine receptor ( $\alpha$ 3 gAChR). Screening for cancer is appropriate for those with specific neural antibody profiles and other risk factors.

Associated neural antibodies in peripheral neuropathies include anti neuronal nuclear antibody type 1 or anti-Hu, CASPR2, gAChR, ganglioside (GM1 IgG and IGM) antibodies.

**Coding Note:** Code also the causing condition

<b>8E4A.2</b>	<b>Paraneoplastic or autoimmune neuromuscular transmission disorders</b>
	NMT disorders are defined by a variable disturbance of the function of the neuromuscular transmission, resulting in fluctuating muscle weakness and fatigue. These are usually classified into pre- and postsynaptic disorders.
	Presynaptic disorders, mainly the Lambert Eaton Myasthenic Syndrome (LEMS) is associated with antibodies targeting the voltage gated calcium channels (PQ and N type). LEMS is associated with malignancy (pulmonary or extra-pulmonary small cell carcinoma) in about 50% of cases. In the context of LEMS the detection of SOX 1 (anti glial nuclear) antibodies is highly predictive of cancer.
	Postsynaptically, myasthenia gravis is mostly (> 90%) associated with antibodies targeting the muscle acetylcholine receptor (AChR) or rarely other proteins (including muscle -specific kinase -MuSK). Myasthenia is usually not considered a paraneoplastic disease, with the exception of thymoma in about 10% cases.
<b>Coding Note:</b>	Code also the causing condition
	<b>Coded Elsewhere:</b> Lambert-Eaton syndrome (8C62)
	Myasthenia gravis (8C60)
<b>8E4A.3</b>	<b>Paraneoplastic or autoimmune disorders of the muscle</b>
	Paraneoplastic and autoimmune diseases of muscle present with weakness and can be caused by a variety of causes, either by undefined remote effects or autoimmune effects in cancer, or autoimmune mechanisms in non cancer related conditions. The presentation is variable, usually presenting with a proximal myopathic pattern.
<b>Coding Note:</b>	Code also the causing condition
<b>8E4A.Y</b>	<b>Other specified paraneoplastic or autoimmune disorders of the nervous system</b>
<b>Coding Note:</b>	Code also the causing condition
<b>8E4A.Z</b>	<b>Paraneoplastic or autoimmune disorders of the nervous system, unspecified</b>
<b>Coding Note:</b>	Code also the causing condition

### Postprocedural disorders of the nervous system (8E60-8E66)

<b>Coded Elsewhere:</b>	Anoxic-ischaemic encephalopathy (8B24.0)
	Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)
	Post dural puncture headache (8A84.Y)
	Dural graft-associated Creutzfeldt-Jakob Disease (8E01.0)

### **8E60 Post ventricular shunting leak**

**8E61**

**Post radiation injury of the nervous system**

**Coded Elsewhere:** Post radiation lumbosacral plexopathy (8B92.0)

Post radiation polyneuropathy (8D43.21)

Post radiation brachial plexopathy (8B91.Y)

**8E61.0**

**Radiation-induced brain injury**

Injury to the brain from therapeutic cranial irradiation which may be divided temporally into three syndromes: Acute or early toxicity which is consequent upon immediate exposure to radiation, early-delayed injury and late-delayed injury although the three may overlap.

**8E61.1**

**Spinal cord irradiation**

**8E61.Z**

**Post radiation injury of the nervous system, unspecified**

**8E62**

**Postprocedural meningitis**

Inflammation of the meninges due to a procedure. The syndrome is clinically characterised by headache, neck stiffness, fever and photophobia. Diagnosis may be aided by neuroimaging and spinal fluid analysis which may reveal a lymphocytic pleocytosis and raised protein.

**8E63**

**Post pump encephalopathy**

**8E64**

**Multifocal cerebral infarctions**

**8E66**

# CHAPTER 09

---

## Diseases of the visual system

This chapter has 160 four-character categories.

Code range starts with 9A00

This refers to any diseases of the visual system, which includes the eyes and adnexa, the visual pathways and brain areas, which initiate and control visual perception and visually guided behaviour.

- Exclusions:**
- Certain conditions originating in the perinatal period (Chapter 19)
  - Certain infectious or parasitic diseases (Chapter 01)
  - Complications of pregnancy, childbirth and the puerperium (Chapter 18)
  - Endocrine, nutritional or metabolic diseases (Chapter 05)
  - Injury, poisoning or certain other consequences of external causes (Chapter 22)
  - Posterior cortical atrophy (8A21.0)

- Coded Elsewhere:**
- Neoplasms of the eye or ocular adnexa
  - Reasons for contact with the health care system in relation to eyes or vision
  - Contusion of eyeball or orbital tissues (NA06.9)
  - Foreign body in multiple parts of external eye (ND70.2)
  - Oculocutaneous albinism (EC23.20)
  - Traumatic injury to eyeball (NA06.8)
  - Birth injury to eye (KA41)
  - Late congenital syphilitic oculopathy (1A60.2)
  - Symptoms, signs or clinical findings of the visual system (MC10-MC2Y)
  - Structural developmental anomalies of the eye, eyelid or lacrimal apparatus (LA10-LA1Z)

This chapter contains the following top level blocks:

- Disorders of the ocular adnexa or orbit
- Disorders of the eyeball - anterior segment
- Disorders of the eyeball - posterior segment
- Disorders of the eyeball affecting both anterior and posterior segments
- Disorders of the visual pathways or centres
- Glaucoma or glaucoma suspect
- Strabismus or ocular motility disorders
- Disorders of refraction or accommodation
- Postprocedural disorders of eye or ocular adnexa

- Impairment of visual functions
- Vision impairment
- Neoplasms of the eye or ocular adnexa
- Reasons for contact with the health care system in relation to eyes or vision

## Disorders of the ocular adnexa or orbit (9A00-9A4Z)

**Coded Elsewhere:** Ocular myiasis (1G01.0)

### Disorders of eyelid or peri-ocular area (9A00-9A0Z)

**Coded Elsewhere:** Congenital malformations of the eyelid

- Seborrhoeic keratosis (2F21.0)
- Cysts of eyelid (2F36.4)
- Eyelid trauma (NA06.0)
- Benign cutaneous neoplasm or cyst of eyelid (2F36.Z)

**9A00**

### Congenital malposition of eyelids

- Coded Elsewhere:** Congenital entropion (LA14.02)  
 Congenital ectropion (LA14.03)  
 Congenital ptosis (LA14.04)  
 Hypotelorism (LB71.0)  
 Hypertelorism (LB71.1)  
 Epiblepharon (LA14.0Y)

**9A00.0**

### Dystopia canthorum

**Coded Elsewhere:** Waardenburg syndrome (EC23.2Y)

**9A00.1**

### Telecanthus

**9A00.Y**

### Other specified congenital malposition of eyelids

**9A00.Z**

### Congenital malposition of eyelids, unspecified

**9A01**

### Infectious disorders of eyelid

- Coded Elsewhere:** Trachoma (1C23)  
 Involvement of eyelid in tuberculosis (1B12.1)  
 Involvement of eyelid in leprosy (1B20.3)  
 Verruca vulgaris of eyelid (1E80.Y)

**9A01.0**

### Preseptal cellulitis

**9A01.1**

### Abscess of eyelid

- 9A01.2** **Hordeolum**  
An acute focal infection usually by *Staphylococcus aureus* involving the eyelash follicle and its associated meibomian and Zeis glands. If the principal focus of infection is the follicle, it presents with a painful boil which discharges pus at the eyelid margin (external hordeolum or stye). If the infection is centred on the meibomian gland (internal hordeolum) then suppuration onto the conjunctival surface occurs.
- 9A01.20** **Hordeolum externum**  
An acute focal pyogenic infection of the eyelash follicle commonly known as a stye and caused predominantly by *Staphylococcus aureus*. It presents as an acute painful inflammatory eyelid swelling which subsequently discharges at the eyelid margin.
- 9A01.21** **Hordeolum internum**  
A focal acute pyogenic infection, usually by *Staphylococcus aureus*, of a meibomian gland, the normal secretion from which into the eyelash follicle is blocked. It presents as an acute inflammatory swelling which may discharge onto the conjunctival surface of the eyelid, or rarely anteriorly through the eyelid skin. It may predispose to formation of a chalazion.
- Exclusions:** Chalazion (9A02.0)
- 9A01.2Z** **Hordeolum, unspecified**
- 9A01.3** **Infectious blepharitis**  
A condition of the eyelid, commonly caused by an infection with a bacterial source. This condition is characterised by pruritus, burning, scratchiness, excessive tearing, or crusty debris around the eyelashes. This condition may also present with lid erythema, collarettes, madarosis, trichiasis, or plugged meibomian glands. Transmission is by direct or indirect contact with an infected individual, endogenous spread, or through fomites.
- Exclusions:** Blepharoconjunctivitis (9A60.4)
- Coded Elsewhere:** Herpes simplex infection of eyelid (1F00.11)  
Molluscum contagiosum of eyelid (1E76)  
Zoster infection of eyelid (1E91.1)
- 9A01.4** **Infestation of eyelid**
- Coding Note:** Code also the causing condition
- Coded Elsewhere:** Parasitic infestation of eyelid in loiasis (1F66.0)  
Parasitic infestation of eyelid in leishmaniasis (1F54.Z)
- 9A01.Y** **Other specified infectious disorders of eyelid**
- 9A01.Z** **Unspecified infectious disorders of eyelid**
- 9A02** **Inflammatory disorders of eyelid**
- Coded Elsewhere:** Atopic eczema of eyelids (9A06.70)  
Seborrhoeic dermatitis of eyelids (9A06.71)

<b>9A02.0</b>	<b>Chalazion</b> A chalazion is a small cyst on the eyelid caused by blockage of a meibomian gland.
<b>9A02.00</b>	Chalazion externum
<b>9A02.01</b>	Chalazion internum
<b>9A02.0Y</b>	Other specified chalazion
<b>9A02.0Z</b>	Chalazion, unspecified
<b>9A02.1</b>	<b>Posterior blepharitis</b> Posterior blepharitis is inflammation of the eyelids secondary to dysfunction of the meibomian glands. Like anterior blepharitis it is a bilateral chronic condition and manifested by a broad spectrum of symptoms involving the lids including inflammation and plugging of the meibomian orifices and production of abnormal secretion upon pressure over the glands. It may be associated with skin rosacea.
<b>9A02.2</b>	<b>Ligneous conjunctivitis</b> Ligneous conjunctivitis (LC) is a rare form of chronic conjunctivitis characterised by the recurrent formation of pseudomembranous lesions most commonly on the palpebral surfaces. It is most frequently reported as a clinical manifestation of severe homozygous or compound-heterozygous hypoplasminogenaemia. Most cases involve infants and children.
<b>9A02.4</b>	<b>Meibomian gland dysfunction</b> This refers to the dysfunction of a special kind of sebaceous gland at the rim of the eyelids inside the tarsal plate, responsible for the supply of meibum, an oily substance that prevents evaporation of the eye's tear film. Meibum prevents tear spillage onto the cheek, trapping tears between the oiled edge and the eyeball, and makes the closed lids airtight.
<b>9A02.Y</b>	<b>Other specified inflammatory disorders of eyelid</b>
<b>9A02.Z</b>	<b>Inflammatory disorders of eyelid, unspecified</b>
<b>9A03</b>	<b>Acquired malposition of eyelid</b>
<b>9A03.0</b>	<b>Blepharoptosis</b> Drooping of the upper lid due to deficient development or paralysis of the levator palpebrae muscle.
<b>9A03.00</b>	Marcus-Gunn syndrome Marcus-Gunn syndrome is characterised by ptosis associated with maxillopalpebral synkinesis. The syndrome is generally unilateral and sporadic, but bilateral and autosomal dominant inherited cases have been reported.
<b>9A03.01</b>	Mechanical ptosis of eyelid

<b>9A03.02</b>	Myogenic ptosis of eyelid This refers to a contraction initiated by the myocyte cell itself instead of an outside occurrence or stimulus such as nerve innervation, causing drooping or falling of the eyelid. The drooping may be worse after being awake longer, when the individual's muscles are tired.
<b>9A03.03</b>	Paralytic ptosis of eyelid
<b>9A03.0Y</b>	Other specified blepharoptosis
<b>9A03.0Z</b>	Blepharoptosis, unspecified
<b>9A03.1</b>	<b>Entropion of eyelid</b>
<b>9A03.10</b>	Cicatricial entropion of eyelid
<b>9A03.11</b>	Mechanical entropion of eyelid
<b>9A03.12</b>	Senile entropion of eyelid This is a senile condition in which the eyelid (usually the lower lid) folds inward. It is very uncomfortable, as the eyelashes constantly rub against the cornea and irritate it. Entropion is usually caused by genetic factors and very rarely it may be congenital when an extra fold of skin grows with the lower eyelid (epiblepharon). Entropion can also create secondary pain of the eye (leading to self trauma, scarring of the eyelid, or nerve damage).
<b>9A03.13</b>	Spastic entropion of eyelid This is a spastic condition in which the eyelid (usually the lower lid) folds inward. It is very uncomfortable, as the eyelashes constantly rub against the cornea and irritate it. Entropion is usually caused by genetic factors and very rarely it may be congenital when an extra fold of skin grows with the lower eyelid (epiblepharon). Entropion can also create secondary pain of the eye (leading to self trauma, scarring of the eyelid, or nerve damage).
<b>9A03.1Y</b>	Other specified entropion of eyelid
<b>9A03.1Z</b>	Entropion of eyelid, unspecified
<b>9A03.2</b>	<b>Ectropion of eyelid</b> The turning outward (eversion) of the edge of the eyelid, resulting in the exposure of the palpebral conjunctiva.
<b>9A03.20</b>	Cicatricial ectropion of eyelid
<b>9A03.21</b>	Mechanical ectropion of eyelid
<b>9A03.22</b>	Senile ectropion of eyelid
<b>9A03.23</b>	Spastic ectropion of eyelid

- 9A03.24** Floppy eyelid syndrome  
 Acquired disorder of unknown origin, manifested by an easily everted floppy upper eyelid and papillary conjunctivitis of the upper palpebral conjunctiva. It is primarily associated with obese men and obstructive sleep apnoea. The tarsus of the upper eyelid becomes softer and looser probably due to mechanical forces and enzymatical changes. The upper eyelid everts during sleep, resulting in irritation, papillary conjunctivitis, and conjunctival keratinization. Effective treatment consists of preventing the upper eyelid from everting while the patient is sleeping.
- 9A03.2Y** Other specified ectropion of eyelid
- 9A03.2Z** Ectropion of eyelid, unspecified
- 9A03.3** **Eyelid retraction**
- 9A03.4** **Lagophthalmos**
- 9A03.40** Cicatricial lagophthalmos
- 9A03.41** Mechanical lagophthalmos
- 9A03.42** Paralytic lagophthalmos
- 9A03.4Y** Other specified lagophthalmos
- 9A03.4Z** Lagophthalmos, unspecified
- 9A03.5** **Dermatochalasis of eyelid**
- 9A03.Y** **Other specified acquired malposition of eyelid**
- 9A03.Z** **Acquired malposition of eyelid, unspecified**
- 9A04** **Acquired disorders of eyelashes**
- Exclusions:** Distichiasis (LA14.0)  
 Structural developmental anomalies of eyelids (LA14.0)
- 9A04.0** **Trichiasis without entropion**  
 This refers to abnormally positioned eyelashes that grow back toward the eye, touching the cornea or conjunctiva. This can be caused by infection, inflammation, autoimmune conditions, congenital defects, eyelid agenesis and trauma such as burns or eyelid injury. This diagnosis is without a condition in which the eyelid (usually the lower lid) folds inward. It is very uncomfortable, as the eyelashes constantly rub against the cornea and irritate it.
- 9A04.1** **Madarosis of eyelid or periocular area**  
 Partial or complete loss of eyelashes and/or eyebrow hairs. Alopecia areata and chronic cutaneous lupus erythematosus are well recognised causes. If the underlying cause is known this should be coded as well.
- 9A04.Y** **Other specified acquired disorders of eyelashes**
- 9A04.Z** **Acquired disorders of eyelashes, unspecified**

**9A05****Movement disorders of eyelid**

**Exclusions:** Tic disorders (8A05)

**Coded Elsewhere:** Benign essential blepharospasm (8A02.00)

Hemifacial spasm (8B88.2)

Facial tic (8A05.03)

**9A05.0****Myokymia of eyelid**

Myokymia is used to describe an involuntary eyelid muscle contraction, typically involving the lower eyelid or less often the upper eyelid. It occurs in normal individuals and typically starts and disappears spontaneously. However, it can sometimes last up to three weeks. Since the condition typically resolves itself, medical professionals do not consider it to be serious or a cause for concern.

**Exclusions:** Facial myokymia (8B88.1)

Myokymia (MB47.5)

**9A05.1****Eyelid apraxia****9A05.Y****Other specified movement disorders of eyelid****9A05.Z****Movement disorders of eyelid, unspecified****9A06****Certain specified disorders of eyelid****9A06.0****Involvement of eyelid by dermatosis classified elsewhere**

Involvement of eyelid by skin diseases such as psoriasis or lichen planus.

**9A06.1****Vitiligo of eyelid or periocular area****9A06.2****Sympblepharon, acquired****9A06.3****Traumatic scar of eyelid****9A06.4****Xanthelasma of eyelid**

Xanthelasmata are a form of plane xanthoma which manifest as sharply demarcated yellowish deposits of lipid within the skin of the eyelid. While they are neither harmful nor painful, these minor growths may be disfiguring and may be the presenting sign of hypercholesterolaemia. They are common in people of Asian origin and those from the Mediterranean region.

**9A06.5****Tear Trough Deformity****9A06.6****Sunken Sulcus Deformity****9A06.7****Dermatitis or eczema of eyelids**

Eczematous blepharitis and contact dermatitis affecting the eyelids.

**Coded Elsewhere:** Irritant contact blepharoconjunctivitis (EK02.11)

**9A06.70****Atopic eczema of eyelids**

Atopic eczema affecting the eyelids. This is a common manifestation of atopic eczema and can result in a significant impact on normal vision and on well-being.

- 9A06.71** Seborrhoeic dermatitis of eyelids  
 Seborrhoeic dermatitis of eyelids (seborrhoeic blepharitis) is common. It is characterised by redness and scaling on the skin of the eyelids with variable involvement of the eyelid margins.  
**Exclusions:** Seborrhoea (ED91.2)
- 9A06.72** Allergic contact blepharoconjunctivitis  
 Allergic contact dermatitis affecting the eyelid and conjunctivae.
- 9A06.7Y** Other specified dermatitis or eczema of eyelids
- 9A06.7Z** Dermatitis or eczema of eyelids, type unspecified
- 9A06.8** **Blepharochalasis**  
 This is a malposition of the eyelid caused either by involution or by inflammation of the eyelid. The inflammation is characterised by exacerbations and remissions of eyelid oedema, which results in a stretching and subsequent atrophy of the eyelid tissue resulting in redundant folds over the lid margins. It typically affects only the upper eyelids, and may be unilateral as well as bilateral.
- 9A06.Y** Other specified disorders of eyelid
- 9A0Y** Other specified disorders of eyelid or peri-ocular area
- 9A0Z** Disorders of eyelid or peri-ocular area, unspecified

Disorders of lacrimal apparatus (9A10-9A1Z)

- Exclusions:** congenital malformations of lacrimal system (LA14.1)
- 9A10** **Disorders of lacrimal gland**
- 9A10.0** **Infections of the lacrimal gland**
- 9A10.1** **Orbital inflammatory syndrome**  
 This refers to a marginated mass-like enhancing soft tissue involving any area of the orbit. It is the most common painful orbital mass in the adult population, and is associated with proptosis, cranial nerve palsy (Tolosa-Hunt syndrome), uveitis, and retinal detachment.
- 9A10.2** **Benign lymphoepithelial lesion of lacrimal gland**  
 This is a type of benign enlargement of the parotid and/or lacrimal glands. This pathologic state is sometimes, but not always, associated with Sjögren's syndrome. This diagnosis is of paired almond-shaped glands, one for each eye, that secrete the aqueous layer of the tear film.
- 9A10.3** **Hyperlacrimation**
- 9A10.4** **Underproduction of tears**  
 Underproduction of tears causes keratoconjunctivitis sicca and can be caused by disorders that interrupt the neural control of lachrymation.

---

**9A4Y      Other specified disorders of the ocular adnexa or orbit**

**9A4Z      Disorders of the ocular adnexa or orbit, unspecified**

### Disorders of the eyeball - anterior segment (9A60-9B3Z)

This refers to any disorders of the front third of the eye that includes the structures in front of the vitreous humour: the cornea, iris, ciliary body, and lens.

**Coded Elsewhere:** Structural disorders of the pupil (LA11.6)

Developmental anomalies of anterior segment (LA11.Y)

### Disorders of conjunctiva (9A60-9A6Z)

This is a group of conditions associated with the conjunctiva which lines the inside of the eyelids and covers the sclera.

**Coded Elsewhere:** Neoplasms of conjunctiva

**9A60      Conjunctivitis**

**Exclusions:**      keratoconjunctivitis (9A70-9A7Z)

**Coded Elsewhere:** Trachoma (1C23)

Viral conjunctivitis (1D84)

Neonatal conjunctivitis or dacryocystitis (KA65.0)

**9A60.0      Papillary conjunctivitis**

**9A60.00**      Giant papillary conjunctivitis

Giant papillary conjunctivitis is a nonallergic hypersensitivity inflammation of the ocular surface, most frequently to contact lenses, ocular prostheses, postoperative sutures, and scleral buckles.

**9A60.01**      Acute atopic conjunctivitis

This is the allergic inflammation of the conjunctiva (mucous membrane that covers the posterior surface of the eyelids and the anterior pericorneal surface of the eyeball) of the immediate type, due to airborne allergens such as pollens, dusts, spores, and animal hair.

**9A60.02**      Allergic conjunctivitis

Allergic conjunctivitis is an IgE-mediated response due to the exposure of seasonal or perennial allergens in sensitized patients. The allergen-induced inflammatory response of the conjunctiva results in the release of histamine and other mediators. Symptoms consist of redness (mainly due to vasodilation of the peripheral small blood vessels), oedema (swelling) of the conjunctiva, itching, and increased lacrimation (production of tears).

**9A60.0Y**      Other specified papillary conjunctivitis

**9A60.0Z**      Papillary conjunctivitis, unspecified

- 9A60.1** **Follicular conjunctivitis**  
**Coded Elsewhere:** Chlamydial conjunctivitis (1C20)  
Herpes simplex keratoconjunctivitis (1F00.1Y)  
Zoster keratoconjunctivitis (1E91.1)  
Keratoconjunctivitis due to adenovirus (1D84.0)  
Keratoconjunctivitis due to Acanthamoeba (1F50)
- 9A60.2** **Cicatrizing conjunctivitis**
- 9A60.3** **Mucopurulent conjunctivitis**  
These are infections of the conjunctiva, containing mucus and pus, by several species such as Haemophilus, Streptococcus, Neisseria, and Chlamydia.
- 9A60.30** Ulceration of conjunctiva  
**9A60.31** Abscess of conjunctiva  
**9A60.32** Conjunctivitis due to Koch-Weeks bacillus  
**9A60.33** Acute epidemic conjunctivitis  
**9A60.3Y** Other specified mucopurulent conjunctivitis  
**9A60.3Z** Mucopurulent conjunctivitis, unspecified
- 9A60.4** **Blepharoconjunctivitis**
- 9A60.5** **Vernal keratoconjunctivitis**  
Vernal keratoconjunctivitis is a persistent and severe form of ocular allergy that affects children and young adults, usually in warm climates. Vernal keratoconjunctivitis typically appears in boys between the ages of 4–12 years. The typical symptoms are intense itching, tearing, and photophobia. Disease exacerbation can be triggered either by allergen re-exposure or by nonspecific stimuli such as sunlight, wind, and dust. The tarsal form is characterised by irregularly sized hypertrophic papillae, leading to a cobblestone appearance of the upper tarsal plate. The limbal form is characterised by transient, multiple limbal, or conjunctival gelatinous yellow-grey infiltrates superposed with white points or deposits, known as Horner-Trantas dots and papillae at the limbus.
- 9A60.6** **Serous conjunctivitis, except viral**  
**9A60.Y** Other specified conjunctivitis  
**9A60.Z** Conjunctivitis, unspecified

**9A61**

**Certain specified disorders of conjunctiva**

**Exclusions:** keratoconjunctivitis (9A70-9A7Z)

**Coded Elsewhere:** Conjunctival blebitis after glaucoma surgery (9D23)

Complications with glaucoma drainage devices (9D24)

Injury of conjunctiva or corneal abrasion without mention of foreign body (NA06.4)

Foreign body in conjunctival sac (ND70.1)

**9A61.0** **Pingueculae**

**9A61.1** **Pterygium**

**Exclusions:** Pseudopterygium of conjunctiva (9A61.2)

**9A61.2** **Pseudopterygium of conjunctiva**

**9A61.3** **Conjunctival scars**

These are cicatrices of the mucous membrane that lines the inner surface of the eyelid and the exposed surface of the eyeball that occur due to various reasons such as trauma, infection or allergy.

**9A61.4** **Conjunctival vascular disorders**

Benign cysts which often appear as small, clear, fluid-filled inclusions of conjunctival epithelium whose goblet cells secrete into the cyst and not onto the surface.

**9A61.40** Vascular abnormalities of conjunctiva

**Coded Elsewhere:** Conjunctival haemangioma or haemolymphangioma (2E81.01)

**9A61.4Y** Other specified conjunctival vascular disorders

**9A61.4Z** Conjunctival vascular disorders, unspecified

**9A61.5** **Conjunctival or subconjunctival haemorrhage**

A conjunctival haemorrhage is a small haematoma clearly delimited on the conjunctiva itself resulting from a direct blow on the eye. Subconjunctival haemorrhage extends from the orbit, forward and deep to the conjunctiva with no posterior limit.

**9A61.6** **Conjunctival or subconjunctival degenerations or deposits**

These are the conjunctival/subconjunctival accumulation of some materials and gradual deterioration with impairment or loss of function, caused by injury, disease, or aging.

**Coded Elsewhere:** Vitamin A deficiency with conjunctival xerosis (5B55.1)

Vitamin A deficiency with conjunctival xerosis and Bitot's spots (5B55.2)

**9A61.Z** **Certain specified disorders of conjunctiva, unspecified**

**9A62****Mucous membrane pemphigoid with ocular involvement**

Mucous membrane pemphigoid (MMP) involving the conjunctivae is also known as ocular pemphigoid. This may be confined to the conjunctivae or may be associated with involvement of other sites as well. Its importance lies in its potential to cause loss of vision and it may thus warrant more aggressive therapy than would be considered for MMP of other sites.

**Coded Elsewhere:** Chronic cicatrizing conjunctivitis, ocular cicatricial pemphigoid (9A60.2)

**9A6Y****Other specified disorders of conjunctiva****9A6Z****Disorders of conjunctiva, unspecified**

Disorders of the cornea (9A70-9A7Z)

This refers to disorders of the transparent front part of the eye that covers the iris, pupil, and anterior chamber. The cornea, with the anterior chamber and lens, refracts light, with the cornea accounting for approximately two-thirds of the eye's total optical power.

**Coded Elsewhere:** Neoplasms of the cornea

**9A70****Hereditary corneal dystrophies**

The term corneal dystrophy embraces a heterogeneous group of bilateral genetically determined non-inflammatory corneal diseases that are usually restricted to the cornea. The designation is imprecise but remains in vogue because of its clinical value.

**Coded Elsewhere:** X-linked ichthyosis (EC20.01)

Cornea plana (LA11.1)

Megalocornea (LA11.1)

Microcornea (LA11.1)

**9A70.0****Endothelial corneal dystrophy****9A70.Y****Other specified hereditary corneal dystrophies****9A70.Z****Hereditary corneal dystrophies, unspecified****9A71****Infectious keratitis**

**Coded Elsewhere:** Herpes simplex keratitis (1F00.10)

**9A72****Traumatic keratitis**

**Exclusions:** Foreign body in cornea (ND70.0)

**9A73****Exposure keratitis**

This is an exposure condition in which the eye's cornea, the front part of the eye, becomes inflamed. The condition is often marked by moderate to intense pain and usually involves impaired eyesight. May cause feelings of scratching each time individual blinks eye.

<b>9A74</b>	<b>Neurotrophic keratitis</b>
<b>Coding Note:</b>	Code also the causing condition
<b>9A75</b>	<b>Autoimmune keratitis</b>
<b>9A76</b>	<b>Corneal ulcer</b>  Loss of epithelial tissue from the surface of the cornea due to progressive erosion and necrosis of the tissue. It is often caused by bacterial, fungal, or viral infection.
<b>9A77</b>	<b>Corneal scars or opacities</b>  Corneal opacity occurs when the cornea is scarred by a variety of infectious and inflammatory eye diseases. These scars stop light from passing through the cornea to the retina and may cause the cornea which is normally transparent to appear white or clouded over.  <b>Coded Elsewhere:</b> Anterior corneal pigmentations (9A78.1) Posterior corneal pigmentations (9A78.1) Stromal corneal pigmentations (9A78.1)
<b>9A77.0</b>	<b>Contact lens-associated corneal infiltrates</b>
<b>9A77.1</b>	<b>Adherent leukoma</b>  This is a white tumour of the cornea enclosing a prolapsed adherent iris.
<b>9A77.Y</b>	<b>Other specified corneal scars or opacities</b>
<b>9A77.Z</b>	<b>Corneal scars or opacities, unspecified</b>
<b>9A78</b>	<b>Certain specified disorders of cornea</b>  <b>Coded Elsewhere:</b> Injury of conjunctiva or corneal abrasion without mention of foreign body (NA06.4)  Ocular laceration or rupture with prolapse or loss of intraocular tissue, unilateral (NA06.87) Ocular laceration without prolapse or loss of intraocular tissue, unilateral (NA06.8D) Ocular laceration or rupture with prolapse or loss of intraocular tissue, bilateral (NA06.88) Ocular laceration without prolapse or loss of intraocular tissue, bilateral (NA06.8E) Foreign body in cornea (ND70.0) Chemical burn of cornea or conjunctival sac (NE00)
<b>9A78.0</b>	<b>Corneal neovascularization</b>
<b>9A78.1</b>	<b>Corneal pigmentations or deposits</b>
<b>9A78.2</b>	<b>Corneal oedema</b>

- 9A78.20** Bullous keratopathy  
This is the maximum stage of corneal oedema.  
It is a pathological condition in which small vesicles, or bullae, are formed in the cornea due to endothelial dysfunction. In a healthy cornea, endothelial cells keep the tissue from excess fluid absorption, pumping it back into the aqueous humour. When affected by some reason, such as Fuchs' dystrophy or a trauma during cataract removal, endothelial cells suffer mortality or damage. The corneal endothelial cells normally do not undergo mitotic cell division, and cell loss results in permanent loss of function.
- 9A78.21** Secondary corneal oedema
- 9A78.2Y** Other specified corneal oedema

Disorders of lens (9B10-9B1Z)

**Coded Elsewhere:** Structural developmental anomalies of lens or zonula (LA12)

Presence of intraocular lens (QB51.2)

<b>9B10</b>	<b>Cataract</b>
<b>9B10.0</b>	<b>Age-related cataract</b> A senile cataract is a clouding of the lens of the eye, which impedes the passage of light, related to ageing, and that occurs usually starting from the age of 40. <b>Exclusions:</b> capsular glaucoma with pseudoexfoliation of lens (9C61.0)
<b>9B10.00</b>	Coronary age-related cataract
<b>9B10.01</b>	Punctate age-related cataract
<b>9B10.02</b>	Mature age-related cataract This is a mature age-related clouding of the lens inside the eye which leads to a decrease in vision. It is the most common cause of blindness and is conventionally treated with surgery. Visual loss occurs because opacification of the lens obstructs light from passing and being focused on to the retina at the back of the eye.
<b>9B10.0Y</b>	Other specified age-related cataract
<b>9B10.0Z</b>	Age-related cataract, unspecified

<b>9B10.1</b>	<b>Infantile or juvenile cataract</b> A cataract is clouding of the lens of the eye, which impedes the passage of light.  <b>Exclusions:</b> Congenital cataract (LA12.1)
<b>9B10.10</b>	Combined forms of infantile and juvenile cataract
<b>9B10.1Y</b>	Other specified infantile or juvenile cataract
<b>9B10.1Z</b>	Infantile or juvenile cataract, unspecified
<b>9B10.2</b>	<b>Certain specified cataracts</b> A cataract is clouding of the lens of the eye, which impedes the passage of light.  <b>Coding Note:</b> Code also the causing condition  <b>Exclusions:</b> Congenital cataract (LA12.1)  <b>Coded Elsewhere:</b> Myotonic cataract (9B10.2Y) Undernutrition-dehydration cataract (9B10.2Y)
<b>9B10.20</b>	Traumatic cataract Partial or complete opacity on or in the lens or capsule of one or both eyes, impairing vision or causing blindness. The many kinds of cataract are classified by their morphology (size, shape, location) or etiology (cause and time of occurrence) resulting from or following injury.
<b>9B10.21</b>	Diabetic cataract This refers to an unspecified group of metabolic diseases in which a person has high blood sugar, either because the pancreas does not produce enough insulin, or because cells do not respond to the insulin that is produced. This diagnosis is with diabetic cataract.  <b>Coding Note:</b> Always assign an additional code for diabetes mellitus.
<b>9B10.22</b>	After-cataract This is a clouding of the lens of the eye, which impedes the passage of light resulting from disease, degeneration, or from surgery.  <b>Inclusions:</b> Secondary cataract Soemmerring ring
<b>9B10.23</b>	Subcapsular glaucomatous flecks  <b>Coding Note:</b> Code also the causing condition
<b>9B10.2Y</b>	Other specified cataracts  <b>Coding Note:</b> Code also the causing condition
<b>9B10.Z</b>	<b>Cataract, unspecified</b>

**9B11****Certain specified disorders of lens**

**Exclusions:** congenital lens malformations (LA12)  
Cataract lens fragments in eye following cataract surgery  
(9D21)

**Coded Elsewhere:** Presence of intraocular lens (QB51.2)

**9B11.0****Aphakia****9B11.1****Dislocation of lens****9B11.Y****Other disorders of lens****9B1Z****Disorders of lens, unspecified****9B3Y****Other specified disorders of the eyeball - anterior segment****9B3Z****Disorders of the eyeball - anterior segment, unspecified****Disorders of the eyeball - posterior segment (9B50-9C0Z)**

This refers to disorders of the back two-thirds of the eye that includes the anterior hyaloid membrane and all of the optical structures behind it: the vitreous humour, retina, choroid, and optic nerve.

**Disorders of sclera (9B50-9B5Z)**

**Coded Elsewhere:** Blue sclera (LA11.0)

**9B50****Episcleritis**

Episcleritis is a benign, self-limiting inflammatory disease affecting part of the eye called the episclera. The episclera is a thin layer of tissue that lies between the conjunctiva and the connective tissue layer that forms the white of the eye (sclera). Episcleritis is a common condition, and is characterised by the abrupt onset of mild eye pain and redness.

**Coded Elsewhere:** Tuberculous episcleritis (1B12.1)

Late syphilitic episcleritis (1A62.20)

**9B51****Scleritis**

Inflammation of the white, opaque, fibrous, outer tunic of the eyeball. Can be associated with uveitis.

**Coded Elsewhere:** Zoster scleritis (1E91.1)

**9B52****Scleral staphyloma**

**Exclusions:** degenerative myopia (9B76)

**9B5Y****Other specified disorders of sclera****9B5Z****Disorders of sclera, unspecified**

Disorders of the choroid (9B60-9B6Z)

**Inclusions:** Disorders of posterior uvea

**Coded Elsewhere:** Neoplasms of choroid

Congenital malformations of choroid (LA13.6)

**9B60**

**Choroidal degeneration**

**Exclusions:** angioid streaks (9B78.3)

**9B61**

**Choroidal dystrophy**

**Exclusions:** ornithinaemia (5C50.9)

**9B62**

**Chorioretinal scars**

**9B63**

**Choroidal haemorrhage or rupture**

**Coded Elsewhere:** Choroidal rupture (NA06.61)

**9B64**

**9B65.0**

**Noninfectious posterior choroiditis**

**Coded Elsewhere:** Ocular Behçet disease (4A62)

**9B65.1**

**Infectious posterior choroiditis**

**Coding Note:**

Code also the causing condition

**Coded Elsewhere:** Late syphilitic posterior uveitis (1A62.20)

Toxoplasma posterior uveitis (1F57.3)

Tuberculous posterior uveitis (1B12.1)

**9B65.2**

**Chorioretinal inflammation**

**Coded Elsewhere:** Toxoplasma chorioretinitis (1F57.3)

Tuberculous chorioretinitis (1B12.1)

Late congenital syphilitic chorioretinitis (1A60.2)

**9B65.Z**

**Choroiditis, unspecified**

**9B66**

**Intermediate choroiditis**

This is a form of uveitis localised to the vitreous and peripheral retina. Primary sites of inflammation include the vitreous of which other such entities as pars planitis, posterior cyclitis, and hyalitis are encompassed. Intermediate uveitis may either be an isolated eye disease or associated with the development of a systemic disease such as multiple sclerosis or sarcoidosis.

**9B66.0** **Noninfectious intermediate choroiditis**  
This is a non-infectious form of uveitis localised to the vitreous and peripheral retina. Primary sites of inflammation include the vitreous of which other such entities as pars planitis, posterior cyclitis, and hyalitis are encompassed. Intermediate uveitis may either be an isolated eye disease or associated with the development of a systemic disease such as multiple sclerosis or sarcoidosis.

**9B66.1** **Infectious intermediate choroiditis**  
This is a infectious form of uveitis localised to the vitreous and peripheral retina. Primary sites of inflammation include the vitreous of which other such entities as pars planitis, posterior cyclitis, and hyalitis are encompassed. Intermediate uveitis may either be an isolated eye disease or associated with the development of a systemic disease such as multiple sclerosis or sarcoidosis.

**9B66.Z** **Intermediate choroiditis, unspecified**

**9B6Y** **Other specified disorders of the choroid**

**9B6Z** **Disorders of the choroid, unspecified**

Disorders of the retina (9B70-9B7Z)

**Coded Elsewhere:** Certain congenital malformations of posterior segment of eye (LA13.8)

Neoplasms of retina

Traumatic injuries of the retina (NA06.6)

Renal retinitis in chronic kidney disease, stage 5 (GB61.5)

Presence of retina Implant (QB51.Y)

Coats disease (LD21.Y)

**9B70** **Inherited retinal dystrophies**

**Coded Elsewhere:** Sjögren-Larsson syndrome (5C52.03)

Usher syndrome (LD2H.4)

Asphyxiating thoracic dystrophy (LD24.B1)

**9B71** **Retinopathy**

**Coding Note:** Code also the causing condition

**9B71.0** **Diabetic retinopathy**

A condition characterised as a disease of the retina (retinopathy) involving damage to the small blood vessels in the retina which is due to chronically high blood glucose levels in people with diabetes.

**Coding Note:** Always assign an additional code for diabetes mellitus.

**9B71.00** Nonproliferative diabetic retinopathy

**Coding Note:** Code also the causing condition

<b>9B71.01</b>	Proliferative diabetic retinopathy This is proliferative retinopathy (damage to the retina) caused by complications of diabetes, which can eventually lead to blindness. It is an ocular manifestation of diabetes, a systemic disease, which affects up to 80 percent of all patients who have had diabetes for 10 years or more. Always assign an additional code for the type of diabetes mellitus.
<b>Coding Note:</b>	Code also the causing condition
<b>9B71.02</b>	Diabetic macular oedema
<b>Coding Note:</b>	Code also the causing condition
<b>9B71.0Z</b>	Diabetic retinopathy, unspecified
<b>Coding Note:</b>	Always assign an additional code for diabetes mellitus.
<b>9B71.1</b>	<b>Hypertensive retinopathy</b>
<b>Coding Note:</b>	Code also the causing condition
<b>9B71.2</b>	<b>Radiation retinopathy</b> Radiation retinopathy is damage to retina due to exposure to ionizing radiation. Radiation retinopathy has a delayed onset, typically after months or years of radiation, and is slowly progressive. In general, radiation retinopathy is seen around 18 months after treatment with external-beam radiation and with brachytherapy.
<b>9B71.3</b>	<b>Retinopathy of prematurity</b> Retinopathy of prematurity is a vasoproliferative disorder that affects extremely premature infants potentially leading to severe visual impairment or blindness. Exposure of newborn premature infants to hyperoxia down regulates retinal vascular endothelial growth factor. Blood vessels constrict and can become obliterated, resulting in delays of normal retinal vascular development. Low birth weight, young gestational age, and severity of illness (e.g. respiratory distress syndrome, bronchopulmonary dysplasia, sepsis) are associated factors. It primarily occurs in extremely low birth weight infants because of the cessation of normal retinal vascular maturation.
<b>Coding Note:</b>	Code also the causing condition
<b>Inclusions:</b>	Retrothalental fibroplasia

<b>9B71.4</b>	<b>Paraneoplastic retinopathy</b>
	Paraneoplastic retinopathies result from a targeted attack on the retina due to a tumour immune response initiated by onco-neural antigens derived from systemic cancer. Patients usually present after cancer diagnosis with progressive visual dimming and photopsias but dysfunction of rods (impaired dark adaption and peripheral vision loss) and cones (decreased visual acuity, colour dysfunction, photosensitivity and glare) may also occur. Symptoms are often worse than clinical signs. Other causes of retinopathy should be excluded. Multiple anti-retinal autoantibodies (e.g. anti-recoverin antibodies) are described although their significance is uncertain. Two major subsets are recognised: cancer-associated retinopathy (most commonly small-cell lung cancer) and melanoma-associated retinopathy.
	Associated neural autoantibodies include:
	CRMP5 (anti-CV2) (collapsin response mediator protein 5 - anti CV2); anti-recoverin autoantibodies; and alpha-enolase autoantibodies.
<b>Coding Note:</b>	Code also the causing condition
<b>9B71.40</b>	Melanoma associated retinopathy
<b>9B71.4Y</b>	Other specified paraneoplastic retinopathy
<b>Coding Note:</b>	Code also the causing condition
<b>9B71.4Z</b>	Paraneoplastic retinopathy, unspecified
<b>Coding Note:</b>	Code also the causing condition
<b>9B71.5</b>	<b>Autoimmune retinopathy</b>
	Autoimmune retinopathies are immune-mediated inflammatory disorders of the retina that differ from paraneoplastic retinopathies in the lack of association with cancer. Patients present with progressive visual loss and dysfunction of rods (impaired dark adaption and peripheral vision problems) and cones (visual acuity, colour dysfunction, photosensitivity and glare) may occur. The symptoms are often worse than the clinical signs on fundoscopy. Multiple anti-retinal autoantibodies (e.g. anti-recoverin antibodies) are described although their significance is uncertain. Autoimmune retinopathy is a diagnosis of exclusion and other causes of retinopathy need to be ruled out, while the potential role of immunotherapy remains uncertain.
	Associated neural autoantibodies include:
	anti-recoverin autoantibodies; alpha-enolase autoantibodies; anti-transducin autoantibodies.
<b>Coding Note:</b>	Code also the causing condition
<b>9B71.Y</b>	<b>Other specified retinopathy</b>
<b>Coding Note:</b>	Code also the causing condition
<b>9B71.Z</b>	<b>Retinopathy, unspecified</b>
<b>Coding Note:</b>	Code also the causing condition

**9B72****Inflammatory diseases of the retina**

This refers to inflammatory diseases of light-sensitive layer of tissue, lining the inner surface of the eye. The optics of the eye create an image of the visual world on the retina, which serves much the same function as the film in a camera.

**Coded Elsewhere:** Retinal vasculitis (9B78.12)

**9B72.0****Viral retinitis****9B72.00****Cytomegaloviral retinitis**

This is an inflammation of the eye's retina that can lead to blindness. This is a DNA virus in the family Herpesviridae known for producing large cells with nuclear and cytoplasmic inclusions. Such inclusions are called an "owl's eye" effect.

**9B72.01****HIV retinitis****9B72.0Y****Other specified viral retinitis****9B72.0Z****Viral retinitis, unspecified****9B72.Y****Other specified inflammatory diseases of the retina****9B72.Z****Inflammatory diseases of the retina, unspecified****9B73****Retinal detachments or breaks**

Retinal breaks are full thickness openings in the neurosensory retina that can be in the form of a hole, a tear or a retinal dialysis. Retinal detachment is a condition in which the retina peels away from its underlying layer of support tissue.

**Exclusions:** detachment of retinal pigment epithelium (9B78.6)

**9B73.0****Retinal detachment with retinal break**

**Inclusions:** Rhegmatogenous retinal detachment

**9B73.1****Retinoschisis**

Retinoschisis is an eye disease characterised by the abnormal splitting of the retina's neurosensory layers.

**9B73.10****Adult retinoschisis****9B73.11****Juvenile retinoschisis**

X-linked retinoschisis is a genetic ocular disease that is characterised by reduced visual acuity in males due to juvenile macular degeneration.

**9B73.1Y****Other specified retinoschisis****9B73.1Z****Retinoschisis, unspecified****9B73.2****Retinal cysts**

A retinal cyst is a closed sac, having a distinct membrane and division compared to the nearby tissue in retina that can either be congenital or acquired.

**Exclusions:** congenital retinoschisis (LA13.3)

Microcystoid degeneration of retina (9B78.4)

<b>9B73.3</b>	<b>Serous retinal detachment</b> This occurs due to inflammation, injury or vascular abnormalities that results in fluid accumulating underneath the retina without the presence of a hole, tear, or break.  <b>Exclusions:</b> Central serous chorioretinopathy (9B75.2)
<b>9B73.4</b>	<b>Retinal breaks without detachment</b>  <b>Exclusions:</b> Chorioretinal scars after surgery for detachment (9D22) peripheral retinal degeneration without break (9B78.4)
<b>9B73.Y</b>	<b>Other specified retinal detachments or breaks</b>
<b>9B73.Z</b>	<b>Retinal detachments or breaks, unspecified</b>
<b>9B74</b>	<b>Retinal vascular occlusions</b> These are obstruction or closure of retinal vascular structures.  <b>Exclusions:</b> amaurosis fugax (9D51)
<b>9B74.0</b>	<b>Retinal artery occlusions</b>
<b>9B74.1</b>	<b>Retinal venous occlusions</b>
<b>9B74.2</b>	<b>Combined retinal arterial and vein occlusion</b>
<b>9B74.Y</b>	<b>Other specified retinal vascular occlusions</b>
<b>9B74.Z</b>	<b>Retinal vascular occlusions, unspecified</b>
<b>9B75</b>	<b>Macular disorders</b>
<b>9B75.0</b>	<b>Age-related macular degeneration</b> Age-related macular degeneration (ARMD) is defined as an ocular disease leading to loss of central vision in the elderly, and characterised by primary and secondary damage of macular retinal pigment epithelial (RPE) cells, resulting in formation of drusen (deposits lying beneath the RPE), choroidal neovascularization (CNV), and atrophy of photoreceptors and choriocapillaris layer of the choroidea.  <b>Coded Elsewhere:</b> Small drusen of the macula (MC20.1)
<b>9B75.00</b>	Early age-related macular degeneration consists of a combination of multiple small drusen, few intermediate drusen (63 to 124 microns in diameter), or RPE abnormalities.
<b>9B75.01</b>	Intermediate age-related macular degeneration consists of extensive intermediate drusen, at least one large druse (>=125 microns in diameter), or geographic atrophy not involving the centre of the fovea
<b>9B75.03</b>	Atrophic late-stage age-related macular degeneration
<b>9B75.04</b>	Neovascular late-stage age-related macular degeneration
<b>9B75.0Y</b>	Other specified age-related macular degeneration
<b>9B75.0Z</b>	Age-related macular degeneration, unspecified

- 9B75.1** **Non-traumatic macular hole**
- 9B75.2** **Central serous chorioretinopathy**  
This is an eye disease which causes visual impairment, often temporary, usually in one eye. When the disorder is active it is characterised by leakage of fluid under the retina that has a propensity to accumulate under the central macula.
- 9B75.3** **Macular telangiectasia**
- 9B75.Y** **Other specified macular disorders**
- 9B75.Z** **Macular disorders, unspecified**
- 9B76** **Degenerative high myopia**  
Macular lesions occurring in people with myopia, usually high myopia, causing a decrease of the best corrected visual acuity and comprising myopic chorioretinal atrophy, myopic choroidal neovascularization and myopic retinoschisis
- 9B77** **Eales disease**  
Eales disease is a retinal vasculopathy that presents as an inflammatory stage with retinal periphlebitis affecting especially peripheral retina, then an ischemic stage with sclerosis of retinal veins, and finally a proliferative stage characterised by neovascularization, haemorrhage and retinal detachment.
- 9B78** **Certain specified retinal disorders**  
*Coded Elsewhere:* Double heterozygous sickling disorders with retinopathy (3A51.3)  
Retinal dystrophy in GM2 gangliosidosis (5C56.00)
- 9B78.0** **Retinal vasculopathy and cerebral leukodystrophy**  
Retinal vasculopathy and cerebral leukodystrophy is an inherited group of small vessel diseases comprised of cerebroretinal vasculopathy, hereditary vascular retinopathy and hereditary endotheliopathy with retinopathy, nephropathy and stroke (HERNS); all exhibiting progressive visual impairment as well as variable cerebral dysfunction.  
*Coded Elsewhere:* HERNS syndrome (LD2F.1Y)
- 9B78.1** **Background retinopathy and retinal vascular changes**  
Background retinopathy is the earliest visible change to the retina in diabetes, characterised by some retinal vascular changes, e.g. the capillaries in the retina may become blocked, they may bulge slightly (microaneurysm) and may leak blood or fluid.
- 9B78.10** Changes in retinal vascular appearance
- 9B78.11** Exudative retinopathy

Proliferative diabetic retinopathy (9B71.01)
- 9B78.3** **Degeneration of macula or posterior pole**
- Exclusions:** Age-related macular degeneration (9B75.0)
- 9B78.30** Reticular pseudodrusen  
Histologically located above the retinal pigment epithelium, this finding is often associated with other retinal disease.
- 9B78.3Y** Other specified degeneration of macula or posterior pole
- 9B78.3Z** Degeneration of macula or posterior pole, unspecified
- 9B78.4** **Peripheral retinal degeneration**
- Exclusions:** with retinal break (9B73.4)
- 9B78.5** **Retinal haemorrhage**
- Exclusions:** Traumatic retinal haemorrhage (NA06.7)
- 9B78.6** **Separation of retinal layers**
- Inclusions:** Detachment of retinal pigment epithelium
- 9B78.60** Serous detachment of retinal pigment epithelium  
This refers to the serous detachment of the pigmented cell layer just outside the neurosensory retina that nourishes retinal visual cells, and is firmly attached to the underlying choroid and overlying retinal visual cells.
- 9B78.61** Haemorrhagic detachment of retinal pigment epithelium  
This refers to the haemorrhagic detachment of the pigmented cell layer just outside the neurosensory retina that nourishes retinal visual cells, and is firmly attached to the underlying choroid and overlying retinal visual cells.
- 9B78.6Y** Other specified separation of retinal layers
- 9B78.6Z** Separation of retinal layers, unspecified
- 9B78.7** **Retinal oedema**
- 9B78.8** **Retinal ischaemia**
- Coding Note:** Code also the causing condition
- 9B78.9** **Retinal atrophy**  
This is a group of genetic diseases and is characterised by the bilateral degeneration of the retina, causing progressive vision loss culminating in blindness.
- 9B7Y** **Other specified disorders of the retina**
- 9B7Z** **Disorders of the retina, unspecified**

Disorders of the vitreous body (9B80-9B8Z)

Any condition of the transparent, semigelatinous substance that fills the cavity behind the crystalline lens of the eye and in front of the retina.

**Coded Elsewhere:** Congenital anomalies of the vitreous (LA13.0)

**9B80            Inherited vitreoretinal disorders**

**Coded Elsewhere:** Stickler syndrome (LD2F.1Y)

**9B81            Posterior vitreous detachment**

**9B82            Vitreous prolapse**

**Exclusions:** vitreous syndrome following cataract surgery (9D20)

**9B83            Vitreous haemorrhage**

**9B84            Vitreous opacities, membranes or strands**

**9B8Y            Other specified disorders of the vitreous body**

**9B8Z            Disorders of the vitreous body, unspecified**

---

**9C0Y            Other specified disorders of the eyeball - posterior segment**

**9C0Z            Disorders of the eyeball - posterior segment, unspecified**

Disorders of the eyeball affecting both anterior and posterior segments (9C20-9C2Z)

**9C20            Panuveitis**

**9C20.0          Noninfectious panuveitis**

**Coded Elsewhere:** Multifocal choroiditis (9B65.0)

**9C20.1          Infectious panuveitis**

**Coded Elsewhere:** Tuberculous panuveitis (1B12.1)

Infectious panuveitis in Lyme disease (1C1G.12)

**9C20.2          Purulent endophthalmitis**

Suppurative inflammation of the tissues of the internal structures of the eye; often caused by fungi, necrosis of intraocular tumours, or retained intraocular foreign bodies. Other aetiology can be any infectious uveitis.

**9C20.Y          Other specified panuveitis**

**9C20.Z          Panuveitis, unspecified**

**9C21            Endophthalmitis**

**Coded Elsewhere:** Purulent endophthalmitis (9C20.2)

**9C21.0          Sympathetic uveitis**

<b>9C21.Y</b>	<b>Other specified endophthalmitis</b>
<b>9C21.Z</b>	<b>Endophthalmitis, unspecified</b>
<b>9C22</b>	<b>Eyeball deformity</b>
	<b>Coded Elsewhere:</b> Microphthalmos (LA10.0)
	Clinical anophthalmos (LA10.1)
	Microphthalmos associated with syndromes (LD21.0)
<b>9C22.0</b>	<b>Atrophy bulbi</b>
<b>9C22.1</b>	<b>Phthisis bulbi</b>
<b>9C22.Y</b>	<b>Other specified eyeball deformity</b>
<b>9C22.Z</b>	<b>Eyeball deformity, unspecified</b>

<b>9C2Z</b>	<b>Disorders of the eyeball affecting both anterior and posterior segments, unspecified</b>

### Disorders of the visual pathways or centres (9C40-9C4Z)

This refers to disorders part of the central nervous system which gives organisms the ability to process visual detail, as well as enabling the formation of several non-image photo response functions.

<b>9C40</b>	<b>Disorder of the optic nerve</b>
	<b>Coded Elsewhere:</b> Congenital malformation of optic disc (LA13.7)
	Injury of optic nerve, unilateral (NA04.10)
	Malignant neoplasm of the optic nerve (2A02.12)
<b>9C40.0</b>	<b>Infectious optic neuropathy</b>
	<b>Coded Elsewhere:</b> Late syphilitic retrobulbar neuritis (1A62.20)
<b>9C40.1</b>	<b>Optic neuritis</b>
	Optic neuritis is a condition related to immune mediated inflammation of the optic nerve. It is commoner in women and can be the first presenting symptom of MS. The symptoms are those of blurred vision, pain on moving the eye and in the vast majority it is self limiting.
	<b>Coded Elsewhere:</b> Neuromyelitis optica (8A43)
<b>9C40.10</b>	Retrobulbar neuritis
<b>9C40.1Y</b>	Other specified optic neuritis
<b>9C40.1Z</b>	Optic neuritis, unspecified
<b>9C40.2</b>	<b>Neuroretinitis</b>

- 9C40.3**      **Perineuritis of optic nerve**  
                 Inflammation of the optic nerve sheath without inflammation of the nerve itself
- 9C40.4**      **Ischaemic optic neuropathy**  
                 Optic nerve disorders caused by an ischaemic process of the optic nerve
- 9C40.40**     Anterior ischemic optic neuropathy  
                 This refers to anterior ischemic damage to the optic nerve due to any cause. Damage and death of these nerve cells, or neurons, leads to characteristic features of optic neuropathy.
- 9C40.41**     Posterior ischemic optic neuropathy  
                 This refers to posterior ischemic damage to the optic nerve due to any cause. Damage and death of these nerve cells, or neurons, leads to characteristic features of optic neuropathy.
- 9C40.4Y**     Other specified ischaemic optic neuropathy
- 9C40.4Z**     Ischaemic optic neuropathy, unspecified
- 9C40.5**      **Compressive optic neuropathy**  
                 Optic nerve disorders caused by the compression of the optic nerve
- 9C40.6**      **Infiltrative optic neuropathy**  
                 Optic nerve disorders caused by an infiltrative process of the optic nerve
- 9C40.7**      **Traumatic optic neuropathy**  
                 Optic nerve disorders due to trauma to the optic nerve
- 9C40.8**      **Hereditary optic neuropathy**  
                 Optic nerve disorders caused by genetic abnormalities  
*Coded Elsewhere:* Leber hereditary optic neuropathy (8C73.Y)
- 9C40.9**      **Glaucomatous optic neuropathy**  
*Inclusions:*      Glaucomatous optic atrophy
- 9C40.A**      **Optic disc swelling**  
                 This refers to swelling in the location where ganglion cell axons exit the eye to form the optic nerve. There are no light sensitive rods or cones to respond to a light stimulus at this point.
- 9C40.A0**     Papilloedema  
                 Optic disc swelling that results from increased intracranial pressure  
*Inclusions:*      Optic disc swelling that results from increased intracranial pressure
- 9C40.A1**     Optic disc swelling associated with uveitis
- 9C40.AY**     Other specified optic disc swelling
- 9C40.AZ**     Optic disc swelling, unspecified

**9C40.B**      **Optic atrophy**  
Optic atrophies (OA) refer to a specific group of hereditary optic neuropathies in which the cause of the optic nerve dysfunction is inherited either in an autosomal dominant or autosomal recessive pattern. Autosomal dominant optic atrophy (ADOA), type Kjer, is the most common OA, whereas autosomal recessive optic atrophy (AROA) is a rare form.

**Coded Elsewhere:** Leber hereditary optic neuropathy (8C73.Y)

**9C40.B0**      Congenital optic atrophy

**9C40.B1**      Acquired optic atrophy

**Coding Note:** Code also the causing condition

**9C40.BZ**      Optic atrophy, unspecified

**9C40.Y**      **Other specified disorder of the optic nerve**

**9C40.Z**      **Disorder of the optic nerve, unspecified**

**9C41**      **Disorder of optic chiasm**

This is a group of conditions associated with the optic chiasm, the part of the brain where the optic nerves (CN II) partially cross.

**Coding Note:** Use additional code, if desired, to identify underlying condition.

**9C42**      **Disorder of post chiasmal visual pathways**

**Coding Note:** Use additional code, if desired, to identify underlying condition.

**Inclusions:** Disorders of optic tracts, geniculate nuclei and optic radiations

**9C43**      **Disorder of visual cortex**

**Coding Note:** Use additional code, if desired, to identify underlying condition.

**9C44**      **Disorder of higher visual centres**

**Coding Note:** Use additional code, if desired, to identify underlying condition.

**9C4Y**      **Other specified disorders of the visual pathways or centres**

**9C4Z**      **Disorders of the visual pathways or centres, unspecified**

Glaucoma or glaucoma suspect (9C60-9C6Z)

**9C60**      **Glaucoma suspect**

**9C61**      **Glaucoma**

**Exclusions:** Traumatic glaucoma due to birth injury (KA41)

**Coded Elsewhere:** Glaucomatous optic neuropathy (9C40.9)

<b>9C61.0</b>	<b>Primary open-angle glaucoma</b> Primary open-angle glaucoma is a chronic progressive optic neuropathy with characteristic morphological changes at the optic nerve head and retinal nerve fibre layer in the absence of other ocular disease or congenital anomalies. Progressive retinal ganglion cell death and visual field loss are associated with these changes. Anterior chamber angle appearance is normal and major risk factors include level of intraocular pressure and older age.
<b>9C61.00</b>	Normal tension glaucoma Normal tension glaucoma is a condition considered to be within the continuum of primary open-angle glaucoma; the term is used when intraocular pressure is within the statistically normal range (10-21 mmHg).
<b>9C61.01</b>	Ocular hypertension Ocular hypertension is a condition of elevated intraocular pressure in the absence of optic nerve, nerve fibre layer or visual field abnormalities.
<b>9C61.0Y</b>	Other specified primary open-angle glaucoma
<b>9C61.0Z</b>	Primary open-angle glaucoma, unspecified
<b>9C61.1</b>	<b>Primary angle closure and angle closure glaucoma</b> Primary angle closure glaucoma is a condition described as angle closure or/and peripheral anterior synechiae with elevated intraocular pressure and evidence of optic nerve damage.
<b>9C61.10</b>	Primary angle closure suspect or anatomical narrow angle Primary angle closure glaucoma suspect is a condition of narrow anterior chamber angle, suspicious for future closure, with no signs of trabecular meshwork or optic nerve damage.
<b>9C61.11</b>	Primary angle-closure Primary angle closure is a condition defined by the presence of iridotrabecular contact with elevated intraocular pressure or peripheral anterior synechiae but no signs of optic nerve damage.
<b>9C61.12</b>	Primary angle closure glaucoma Primary angle closure glaucoma is a condition described as angle closure or/and peripheral anterior synechiae with elevated intraocular pressure and evidence of optic nerve damage.
<b>9C61.13</b>	Primary angle closure without pupillary block Primary angle closure without pupillary block is a condition described as anatomical variation in the iris root in which narrowing of the anterior chamber angle occurs independent of pupillary block causing angle closure.
<b>9C61.14</b>	Acute angle closure with pupillary block Acute Angle Closure (AAC) with pupillary block is a condition described as circumferential iris apposition to the trabecular meshwork with rapid and excessive increase in intraocular pressure that does not resolve spontaneously.

<b>9C61.15</b>	Intermittent angle-closure Intermittent Angle Closure is a milder clinical manifestation of acute angle closure that resolves spontaneously.
<b>9C61.16</b>	Chronic angle-closure Chronic angle closure is a condition when intraocular pressure elevation is due to variable portions of anterior chamber angle being permanently closed by peripheral anterior synechiae.
<b>9C61.17</b>	Condition after acute angle-closure glaucoma attack Condition after acute angle closure glaucoma attack refers to a condition after a previous episode of acute angle-closure attack, usually with secondary alterations of the iris (sphincter lesions) and lens ("Glaukomflecken", cataract).
<b>9C61.1Y</b>	Other specified primary angle closure and angle closure glaucoma
<b>9C61.1Z</b>	Primary angle closure and angle closure glaucoma, unspecified
<b>9C61.2</b>	<b>Secondary open-angle glaucoma</b>
<b>Coding Note:</b>	Code also the causing condition <b>Coded Elsewhere:</b> Glaucoma due to ocular surgery or laser (9D25)
<b>9C61.20</b>	Pseudoexfoliative open-angle glaucoma Pseudoexfoliative Open-Angle glaucoma is a condition where fibrillar pseudoexfoliative material is produced by various ocular tissues and is deposited on the trabecular meshwork, lens, and other structures of the anterior segment leading to intraocular pressure elevation and subsequent optic nerve damage.
<b>9C61.21</b>	Pigmentary open-angle glaucoma Pigmentary open-angle glaucoma is a condition where pigment is liberated due to rubbing of the zonules against the posterior iris sheath that leads to obstruction of the trabecular meshwork causing intraocular pressure elevation and subsequent optic nerve damage.
<b>9C61.22</b>	Lens-induced secondary open-angle glaucoma
<b>9C61.23</b>	Glaucoma associated with intraocular haemorrhage Ghost cell glaucoma is a condition where bleeding into the vitreous body or anterior chamber can lead to intraocular pressure elevation when stiffer red blood cells that have lost their haemoglobin obstruct the trabecular meshwork. <b>Inclusions:</b> ghost cell glaucoma
<b>9C61.24</b>	Glaucoma due to eye inflammation <b>Coding Note:</b> Code also the causing condition
<b>9C61.25</b>	Glaucomato-cyclitic crisis A glaucomato-cyclitic crisis presents with mild keratic precipitates and aqueous flare, acute intraocular pressure elevation and optic nerve damage when repeated attacks occur.

<b>9C61.26</b>	Secondary open-angle glaucoma due to parasitic eye disease
<b>Coding Note:</b>	Code also the causing condition
<b>9C61.27</b>	Glaucoma due to intraocular tumours
<b>Coding Note:</b>	Code also the causing condition
<b>9C61.28</b>	Glaucoma associated with retinal detachment
<b>Coding Note:</b>	Code also the causing condition
<b>9C61.29</b>	Glaucoma due to eye trauma
<b>Coding Note:</b>	Code also the causing condition
<b>9C61.2A</b>	Glaucoma due to drugs
<b>9C61.2B</b>	Glaucoma caused by increased episcleral venous pressure
<b>Coding Note:</b>	Code also the causing condition
<b>9C61.2C</b>	Secondary glaucoma due to extra-ocular mass
<b>Coding Note:</b>	Code also the causing condition
<b>9C61.2Y</b>	Other specified secondary open-angle glaucoma
<b>Coding Note:</b>	Code also the causing condition
<b>9C61.2Z</b>	Secondary open-angle glaucoma, unspecified
<b>Coding Note:</b>	Code also the causing condition
<b>9C61.3</b>	<b>Secondary angle closure glaucoma</b>
<b>9C61.30</b>	Secondary angle closure glaucoma with pupillary block Secondary angle closure glaucoma with pupillary block is a condition where an anteriorly subluxated lens occludes the pupil causing acute secondary angle closure and intraocular pressure elevation.
<b>Coding Note:</b>	Code also the causing condition
<b>9C61.31</b>	Secondary angle closure glaucoma without pupillary block
<b>9C61.32</b>	Neovascular secondary angle closure glaucoma Neovascular secondary angle-closure glaucoma is a frequent condition where neovascular membranes occlude and close the chamber angle by fibrovascular contraction leading to intraocular pressure elevation and subsequent optic nerve damage. Neovascularization can be due to retinal venous occlusion, diabetic retinopathy, ocular ischemia, long-standing retinal detachment and other ischemic conditions of the eye.
<b>Coding Note:</b>	Code also the causing condition
<b>9C61.33</b>	Secondary angle closure glaucoma due to endothelial overgrowth Secondary angle-closure glaucoma due to endothelial overgrowth is a condition where corneal endothelial cells overgrow the trabecular meshwork and iris, closing the angle by tissue contraction leading to intraocular pressure elevation and subsequent optic nerve damage.

- 9C61.34** Secondary angle closure glaucoma due to epithelial ingrowth  
 Epithelial ingrowth is a condition after open globe trauma or surgery where conjunctival or corneal epithelial cells get access to the anterior chamber and overgrow the trabecular meshwork with subsequent intraocular pressure elevation and optic nerve damage.
- 9C61.35** Ciliary block glaucoma  
 Ciliary block glaucoma is a condition where aqueous misdirection into the vitreous cavity displaces the lens-iris diaphragm anteriorly thus causing angle closure with subsequent intraocular pressure elevation and optic nerve damage.
- 9C61.36** Secondary angle closure glaucoma due to other anterior displacement of the lens-iris diaphragm  
 Iris and ciliary body cysts, intraocular tumours, posterior scleritis, uveal effusion, or Silicon Oil or gas in the vitreous cavity can cause IOP elevation by angle closure.
- 9C61.3Y** Other specified secondary angle closure glaucoma
- 9C61.3Z** Secondary angle closure glaucoma, unspecified
- 9C61.4** **Developmental glaucoma**
- Inclusions:**
- Glaucoma of newborn
  - Hydrocephalus
- 9C61.40** Primary congenital glaucoma  
 Primary Congenital Glaucoma is a condition during early infancy where delayed development and malformation of the trabecular meshwork blocks the outflow routes leading to elevated intraocular pressure that causes enlargement of the eyeball (Buphthalmus), corneal oedema, Descemet tears, myopia, and damage to the optic nerve, often resulting in severe visual impairment or blindness
- 9C61.41** Primary infantile glaucoma  
 Primary infantile glaucoma is a condition after 2 years of age where malformation of the trabecular meshwork causes elevated intraocular pressure without enlargement of the eyeball but damage to the optic nerve similar to congenital glaucoma.
- 9C61.42** Secondary childhood glaucoma
- Coding Note:** Code also the causing condition
- Coded Elsewhere:** Aniridia (LA11.3)
- Marfan syndrome (LD28.01)
  - Rubella (1F02)
  - Oculocerebrorenal syndrome (5C60.0)
  - Neurofibromatosis (LD2D.1)
- 9C61.4Y** Other specified developmental glaucoma
- 9C61.4Z** Developmental glaucoma, unspecified

## Strabismus or ocular motility disorders (9C80-9C8Z)

Disorder due to abnormalities of extraocular muscles or ocular motor abnormalities.

**Coded Elsewhere:** Diseases of neuromuscular junction or muscle (8C60-8D0Z)

**9C80**      **Non paralytic strabismus**

Non-paralytic strabismus is an abnormal binocular alignment in which one of the eyes is deviated. There are full ocular movements in each eye. The condition can alternate between eyes or only involve one eye. Strabismus may be intermittent or constant. The abnormal alignment may be present at distance fixation, near fixation or both.

**9C80.0**      **Esotropia**

Esotropia is an abnormal binocular alignment in which one of the eyes has an inward deviation. Fixation can be alternating or monocular. Esotropia is present in all distances. Squint angles can vary with distances.

**9C80.1**      **Exotropia**

Exotropia is an abnormal binocular alignment in which one of the eyes has an outward deviation. Fixation can be alternating or monocular. Exotropia is present in all distances.

**9C80.2**      **Vertical or torsional strabismus**

An abnormal binocular alignment which may be constant or intermittent, that is not horizontal, but vertical or torsional (rotational) around the pupillary axis.

**9C80.3**      **Intermittent strabismus**

An abnormal binocular alignment which is present intermittently, with normal alignment at other times with binocular single vision.

**9C80.30**      Intermittent divergent exotropia

**9C80.31**      Intermittent convergent esotropia

**9C80.3Y**      Other specified intermittent strabismus

**9C80.3Z**      Intermittent strabismus, unspecified

**9C80.4**      **Heterophoria**

A temporary deviation of the eyes from normal binocular alignment when there is disruption of the visual input from one eye. The alignment is normal when there is binocular visual input.

<b>9C80.5</b>	<b>Mechanical strabismus</b> An abnormal binocular alignment caused by abnormalities of ocular movement in one or both eyes caused by damage to the extraocular muscles and/or other orbital structures. Mechanical strabismus is characterised by limitation of movements in one or more directions and variable strabismus.
<b>9C80.Y</b>	<b>Other specified non paralytic strabismus</b>
<b>9C80.Z</b>	<b>Non paralytic strabismus, unspecified</b>
<b>9C81</b>	<b>Ocular motor nerve palsies</b>
	<b><i>Exclusions:</i></b> Internuclear ophthalmoplegia (9C83.5) Internal ophthalmoplegia (9D01.0) ophthalmoplegia progressive supranuclear (8A00.10)
<b>9C81.0</b>	<b>Third nerve palsy</b> <b><i>Inclusions:</i></b> isolated oculomotor nerve palsy
<b>9C81.00</b>	External bilateral paralysis of oculomotor nerve
<b>9C81.0Y</b>	Other specified third nerve palsy
<b>9C81.0Z</b>	Third nerve palsy, unspecified
<b>9C81.1</b>	<b>Fourth nerve palsy</b> <b><i>Inclusions:</i></b> isolated trochlear nerve palsy
<b>9C81.2</b>	<b>Sixth nerve palsy</b> <b><i>Inclusions:</i></b> isolated abducent nerve palsy
<b>9C81.3</b>	<b>Total external ophthalmoplegia</b>
<b>9C81.4</b>	<b>Cavernous sinus syndromes</b>
<b>9C81.Y</b>	<b>Palsy of other specified ocular motor nerve</b>
<b>9C81.Z</b>	<b>Palsy of unspecified ocular motor nerve</b>
<b>9C82</b>	<b>Disorders of extraocular muscles</b> <b><i>Coded Elsewhere:</i></b> Certain paralytic strabismus (9C81.Y)

<b>9C82.0</b>	<b>Progressive external ophthalmoplegia</b> Chronic ophthalmoplegia is characterised by progressive weakness of ocular muscles and levator muscle of the upper eyelid. The condition is mainly manifested in adults. It may be totally and permanently isolated, however in a minority of cases it is associated with skeletal myopathy, which causes abnormal fatigability and even permanent muscle weakness. In this case the affection is still termed isolated progressive external ophthalmoplegia. A large proportion of chronic ophthalmoplegias presents with multisystemic pattern of signs: neurological signs (hearing loss, retinopathy, cerebellar disorders, peripheral neuropathy, etc.), endocrine (diabetes, hypogonadism, hypoparathyroidism, etc.), kidney (kidney failure, tubulopathy, etc.), and heart disorders (conduction disorders, myocardiopathy, etc.).
<b>9C82.1</b>	<b>Muscular dystrophy affecting extraocular muscle</b> Non-specific term that is used to describe a range of primary myopathies that affect the extraocular muscles.  <b>Exclusions:</b> Secondary myopathies (8C80-8C8Z)  <b>Coded Elsewhere:</b> Congenital fibrosis of extraocular muscles (9C82.2)
<b>9C82.2</b>	<b>Congenital cranial dysinnervation syndrome</b>
<b>9C82.3</b>	<b>Restrictive ophthalmopathy</b>
<b>Coding Note:</b>	Code also the causing condition
<b>9C82.4</b>	<b>Oculomotor apraxia</b>
<b>9C82.Y</b>	<b>Other specified disorders of extraocular muscles</b>
<b>9C82.Z</b>	<b>Disorders of extraocular muscles, unspecified</b>
<b>9C83</b>	<b>Disorders of binocular movement</b> Other disorders of binocular movement in which the movement of the two eyes is abnormal.
<b>9C83.0</b>	<b>Palsy of conjugate gaze</b> A palsy of conjugate gaze is an incomplete or absent movement of the two eyes in a particular direction of gaze.  <b>Coded Elsewhere:</b> Progressive supranuclear palsy (8A00.10)
<b>9C83.00</b>	Horizontal gaze palsy A palsy of horizontal gaze is an incomplete or absent movement of the two eyes in a horizontal direction of gaze. May be in one or both directions
<b>9C83.01</b>	Vertical gaze palsy A palsy of vertical gaze is an incomplete or absent movement of the two eyes in the vertical direction of gaze.

<b>9C83.02</b>	Monocular elevator palsy Monocular elevator palsy is an incomplete or absent movement of one eye in upgaze. May be due to pathology in the orbit, as well as infranuclear, internuclear, or supranuclear in origin.
<b>9C83.0Y</b>	Other specified palsy of conjugate gaze
<b>9C83.0Z</b>	Palsy of conjugate gaze, unspecified
<b>9C83.1</b>	<b>Spasm of conjugate gaze</b>
<b>9C83.10</b>	Horizontal conjugate gaze deviation
<b>9C83.11</b>	Upward gaze deviation
<b>9C83.12</b>	Downward gaze deviation
<b>9C83.13</b>	Oculogyric crisis Episodic spells of tonic upward and sometimes lateral deviation of the eyes, rarely downward.
<b>9C83.1Y</b>	Other specified spasm of conjugate gaze
<b>9C83.1Z</b>	Spasm of conjugate gaze, unspecified
<b>9C83.2</b>	<b>Convergence insufficiency</b>
<b>9C83.3</b>	<b>Convergence excess</b>
<b>9C83.4</b>	<b>Spasm of the near reflex</b>
<b>9C83.5</b>	<b>Internuclear ophthalmoplegia</b> This is a disorder of conjugate lateral gaze in which the affected eye shows impairment of adduction.
<b>9C83.6</b>	<b>Anomalies of divergence or deviation of eye movement</b>
<b>9C83.60</b>	Divergence insufficiency
<b>9C83.61</b>	Divergence paralysis
<b>9C83.62</b>	Divergence excess
<b>9C83.63</b>	Synergistic divergence Anomalous innervation of muscle normally supplied by the oculomotor nerve. In congenital unilateral adduction palsy, when adduction is attempted, the affected eye abducts rather than adducts.
<b>9C83.64</b>	Skew deviation a vertical misalignment of the visual axes caused by a disturbance of prenuclear inputs

<b>9C83.65</b>	Ocular tilt reaction skew deviation associated with ocular torsion (cyclodeviation) and a head tilt (ear to shoulder)
<b>9C83.66</b>	Alternating skew deviation
<b>9C83.67</b>	Dissociative vertical divergence
<b>9C83.6Y</b>	Other specified anomalies of divergence or deviation of eye movement

#### Disorders of refraction or accommodation (9D00-9D0Z)

<b>9D00</b>	<b>Disorders of refraction</b>
<b>9D00.0</b>	<p><b>Myopia</b></p> <p>A refractive error in which rays of light entering the eye parallel to the optic axis are brought to a focus in front of the retina when ocular accommodation is relaxed. This usually results from the eyeball being too long from front to back, but can be caused by an overly curved cornea, a lens with increased optical power, or both. It is also called nearsightedness.</p> <p><b>Exclusions:</b> degenerative myopia (9B76)</p>
<b>9D00.1</b>	<p><b>Hypermetropia</b></p> <p>A refractive error in which rays of light entering the eye parallel to the optic axis are brought to a focus behind the retina, as a result of the eyeball being too short from front to back. It is also called farsightedness because the near point is more distant than it is in emmetropia with an equal amplitude of accommodation.</p>

<b>9D00.2</b>	<b>Astigmatism</b> Unequal curvature of the refractive surfaces of the eye. Thus a point source of light cannot be brought to a point focus on the retina but is spread over a more or less diffuse area. This results from the radius of curvature in one plane being longer or shorter than the radius at right angles to it.
<b>9D00.3</b>	<b>Presbyopia</b> The normal decreasing elasticity of the crystalline lens that leads to loss of accommodation.
<b>9D00.4</b>	<b>Anisometropia</b>
<b>9D00.5</b>	<b>Aniseikonia</b>
<b>9D00.6</b>	<b>Transient refractive change</b>
<b>9D00.Y</b>	<b>Other specified disorders of refraction</b>
<b>9D00.Z</b>	<b>Disorders of refraction, unspecified</b>
<b>9D01</b>	<b>Disorders of accommodation</b>
<b>9D01.0</b>	<b>Internal ophthalmoplegia</b>
<b>9D01.1</b>	<b>Paresis of accommodation</b>
<b>9D01.2</b>	<b>Spasm of accommodation</b>
<b>9D01.Y</b>	<b>Other specified disorders of accommodation</b>
<b>9D01.Z</b>	<b>Disorders of accommodation, unspecified</b>
<b>9D0Y</b>	<b>Other specified disorders of refraction or accommodation</b>
<b>9D0Z</b>	<b>Disorders of refraction or accommodation, unspecified</b>

### Postprocedural disorders of eye or ocular adnexa (9D20-9D25)

**Exclusions:** pseudophakia (QB51.2)

**Coded Elsewhere:** Haemorrhage and haematoma of eye or ocular adnexa complicating a procedure (NE81.01)

Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

<b>9D20</b>	<b>Bullous aphakic keratopathy following cataract surgery</b> <i>Inclusions:</i> Vitreal corneal syndrome
<b>9D21</b>	<b>Cataract lens fragments in eye following cataract surgery</b>
<b>9D22</b>	<b>Chorioretinal scars after surgery for detachment</b>
<b>9D23</b>	<b>Conjunctival blebitis after glaucoma surgery</b>
<b>9D24</b>	<b>Complications with glaucoma drainage devices</b>

**9D25**

**Glaucoma due to ocular surgery or laser**

Impairment of visual functions (9D41-9D7Z)

**Coded Elsewhere:** Impairment of electrophysiological functions (MC21)

Polyopia (9D53)

**9D41**

**Impairment of visual field**

Ranges of visual field impairment refer to the extent of peripheral vision outside fixation. The extent should be measured for each eye separately.

**9D42**

**Patterns of visual field impairment**

Patterns of visual field impairment are often indicative for certain disease conditions.

**9D42.0**

**Visual field loss, pattern not specified**

**9D42.2**

**Peripheral field deficit**

**9D42.20**

Enlarged blind spot

**Inclusions:**              Scotoma of blind spot area

**9D42.21**

Arcuate scotoma

A Bjerrum or arcuate scotoma follows the pattern of the retinal nerve fibres. It is typical for glaucomatous defects and can also be caused by juxta-papillary lesions.

**9D42.22**

Nasal step

A nasal step is a discontinuity of the nasal field limit at the horizontal meridian. It is typical for glaucoma.

**9D42.23**

Ring scotoma

A ring scotoma is a scotoma that surrounds the central field. Initially, it may consist of several smaller scotomas that gradually coalesce.

**9D42.24**

Isolated peripheral scotoma

Isolated scotomas may be the result of scarring from infections or surgery.

**9D42.2Y**

Other specified peripheral field deficit

**9D42.2Z**

Peripheral field deficit, unspecified

**9D42.3**

**Hemianopic or quadrantic loss**

Defects that cover a hemi-field or a quadrant in one eye may be the result of optic nerve involvement.

**9D42.4**

**Central scotoma**

A central scotoma is a defect that covers the fovea. It therefore causes visual acuity loss and may necessitate eccentric fixation.

- 9D42.5** **Para-central scotoma**  
A para-central scotoma is a scotoma adjacent to the fovea. Both may minimally affect letter chart acuity, but may interfere significantly with reading and other activities.
- 9D42.6** **Homonymous hemianopia or quadrant anopia**  
Homonymous, binocular field defects present the same or similar patterns in both eyes. They are caused by lesions of the retro-chiasmal pathways.
- 9D42.60** Right hemi-field homonymous hemianopia or quadrant anopia
- 9D42.61** Left hemi-field homonymous hemianopia or quadrant anopia
- 9D42.6Y** Other specified homonymous hemianopia or quadrant anopia
- 9D42.6Z** Homonymous hemianopia or quadrant anopia, unspecified
- 9D42.7** **Heteronymous hemianopia or quadrant anopia**  
Heteronymous field defects present opposite patterns in the two eyes. They may be caused by chiasmal lesions.
- 9D42.70** Bi-nasal defects heteronymous hemianopia or quadrant anopia
- 9D42.71** Bi-temporal defects heteronymous hemianopia or quadrant anopia
- 9D42.7Y** Other specified heteronymous hemianopia or quadrant anopia
- 9D42.7Z** Heteronymous hemianopia or quadrant anopia, unspecified
- 9D42.8** **Visual field loss, other specified forms**
- 9D42.Y** **Other specified patterns of visual field impairment**
- 9D42.Z** **Patterns of visual field impairment, unspecified**
- 9D43** **Impairment of contrast vision**  
Contrast sensitivity refers to the ability to distinguish small differences in brightness between adjacent surfaces.  
Peak Contrast sensitivity refers to the smallest differences that are discernible for large stimuli.  
For smaller objects, such as those involved in many Activities of Daily Living, contrast sensitivity interacts with visual acuity and visual field. Better contrast makes smaller details visible. The visual field is larger for stronger stimuli.
- 9D44** **Impairment of colour vision**  
Colour vision refers to the ability to distinguish colour differences. True colour "blindness" is extremely rare. Most colour vision deficiencies are minor, and congenital, with X-linked recessive inheritance (more prevalent among men). Some drugs and optic neuritis may also cause colour vision deficiencies.
- Inclusions:** achromatopsia  
acquired colour vision deficiency  
colour blindness

9D45	<b>Impairment of light sensitivity</b>
	<b>Coded Elsewhere:</b> Vitamin A deficiency with night blindness (5B55.0)
9D46	<b>Impairment of binocular functions</b>
	Subjective visual experiences (9D50-9D5Z)
	Subjective Visual Experiences are experiences reported by patients, whose presence or absence cannot be verified objectively.
9D50	<b>Visual discomfort</b>
	<b>Inclusions:</b> Asthenopia
9D51	<b>Transient visual loss</b>
	<b>Coded Elsewhere:</b> Amaurosis fugax (8B10.0)
9D52	<b>Hemifield losses</b>
9D53	<b>Entoptic phenomena</b>
	Entoptic phenomena are visual phenomena caused by changes within the eye.
	<b>Coded Elsewhere:</b> Visual floaters (MC1A)
9D54	<b>Visual illusions</b>
	Visual illusions refer to percepts based on an erroneous interpretation of visual input.
9D55	<b>Nonorganic visual loss</b>
9D56	<b>Visual release hallucinations</b>
	Visual release hallucinations, also called Charles Bonnet syndrome, refer to the experience of complex visual hallucinations in a person who has experienced partial or complete loss of vision. Hallucinations are exclusively visual, usually temporary, and unrelated to mental and behavioural disorders.
	<b>Exclusions:</b> Schizophrenia or other primary psychotic disorders (6A20-6A2Z)
9D5Y	<b>Other specified subjective visual experiences</b>
9D5Z	<b>Subjective visual experiences, unspecified</b>
9D7Y	<b>Other specified impairment of visual functions</b>
9D7Z	<b>Impairment of visual functions, unspecified</b>

## Vision impairment (9D90-9D9Z)

A vision impairment results when an eye condition affects the visual system and one or more of its vision functions. Typically, population-based surveys measure visual impairment using exclusively visual acuity, with severity categorized as mild, moderate or severe distance vision impairment or blindness, and near vision impairment. However, in the clinical setting, other visual functions are also often assessed, such as a person's field of vision, contrast sensitivity and colour vision.

**9D90**

### **Vision impairment including blindness**

The table below gives a classification of severity of vision impairment based on visual acuity. For epidemiological studies, it is recommended to collect the following information on visual acuity for each eye, for both eyes open and for distance and near.

- a. Uncorrected visual acuity
- b. Presenting visual acuity
- c. Best corrected visual acuity

Blindness is also categorized according to the degree of constriction of the central visual field in the better eye to less than 10 degrees.

For capturing and coding of "No vision impairment", use QA00.62 (QA00.6 Examination of eyes or vision).

Category	Visual acuity *1	
	Worse than:	Equal to or better than:
No vision impairment		<ul style="list-style-type: none"><li>• 6/12</li><li>• 5/10 (0.5)</li><li>• 20/40</li><li>• 0.3</li></ul>
1 Mild vision impairment	<ul style="list-style-type: none"><li>• 6/12</li><li>• 5/10 (0.5)</li><li>• 20/40</li><li>• 0.3</li></ul>	<ul style="list-style-type: none"><li>• 6/18</li><li>• 3/10 (0.3)</li><li>• 20/70</li><li>• 0.5</li></ul>
2 Moderate vision impairment	<ul style="list-style-type: none"><li>• 6/18</li><li>• 3/10 (0.3)</li><li>• 20/70</li><li>• 0.5</li></ul>	<ul style="list-style-type: none"><li>• 6/60</li><li>• 1/10 (0.1)</li><li>• 20/200</li><li>• 1.0</li></ul>
3 Severe vision impairment	<ul style="list-style-type: none"><li>• 6/60</li><li>• 1/10 (0.1)</li><li>• 20/200</li><li>• 1.0</li></ul>	<ul style="list-style-type: none"><li>• 3/60</li><li>• 1/20 (0.05)</li><li>• 20/400</li><li>• 1.3</li></ul>

Category	<b>Visual acuity *1</b>	
	<b>Worse than:</b>	<b>Equal to or better than:</b>
4 Blindness	<ul style="list-style-type: none"> <li>• 3/60</li> <li>• 1/20 (0.05)</li> <li>• 20/400</li> <li>• 1.3</li> </ul>	<ul style="list-style-type: none"> <li>• 1/60 or counts fingers (CF)</li> <li>• at 1 metre</li> <li>• 1/50 (0.02)</li> <li>• 20/1200 or counts fingers (CF)</li> <li>• at 1 metre</li> <li>• 1.8</li> </ul>
5 Blindness	<ul style="list-style-type: none"> <li>• 1/60</li> <li>• 1/50 (0.02)</li> <li>• 5/300 (20/1200)</li> <li>• 1.8</li> </ul>	Light perception
6 Blindness	No light perception	
9	Undetermined or unspecified	
Near vision impairment	N6 or M 0.8 at 40cms	

\*1 Presented in metres, decimals, feet and logMar

**Coded Elsewhere:** No vision impairment (QA00.62)

- 9D90.1      Mild vision impairment**
- 9D90.2      Moderate vision impairment**
- Inclusions:* visual impairment category 2, in both eyes
- 9D90.3      Severe vision impairment**
- Inclusions:* visual impairment category 3 in one eye, with categories 1 or 2 in the other eye
- 9D90.6      Blindness**
- The numerical definition used for WHO statistics refers to profound, near-total or total loss. The functional definition refers to individuals who have little or no residual vision and who have to rely predominantly on vision substitution skills, i.e. on using senses other than vision (Braille or talking books for reading, a long cane or guide dog for mobility, or touch for manipulation).
- Inclusions:*
- visual impairment category 5
  - visual impairment categories 4, 5, 6 in both eyes
  - visual impairment categories 4, 5, 6 in one eye and categories 1, 2, 3 or 9 in the other eye
  - visual impairment categories 4, 5, 6 in one eye [normal vision in other eye]

**9D90.7      Near vision impairment**

Near vision refers to the ability to perform tasks that require detailed vision at a close distance. It should be measured with both eyes open at the subject's preferred viewing distance and with the subject's habitual near vision correction (if any). Near vision impairment is characterised by a presenting near visual acuity worse than N6.

**9D92      Specific vision dysfunctions**

Specific visual dysfunctions refer to functional deficits in higher cerebral centres. Such dysfunctions may exist with or without visual impairment of the eyes and the lower visual system.

**9D93      Complex vision-related dysfunctions**

Complex Vision-Related Dysfunctions involve interactions with other sensory and motor systems. They reflect the combined effects at all stages of processing.

**9D94      Impairment of presenting visual acuity**

**9D95      Impairment of best corrected visual acuity**

**9D96      Impairment of uncorrected visual acuity**

**9D9Y      Other specified vision impairment**

**9D9Z      Vision impairment, unspecified**

---

**9E1Y      Other specified diseases of the visual system**

**9E1Z      Diseases of the visual system, unspecified**

# CHAPTER 10

---

## Diseases of the ear or mastoid process

This chapter has 78 four-character categories.

Code range starts with AA00

This chapter contains diseases of the ear and diseases of the mastoid process.

- Exclusions:**
- Complications of pregnancy, childbirth and the puerperium (Chapter 18)
  - Certain infectious or parasitic diseases (Chapter 01)
  - Certain conditions originating in the perinatal period (Chapter 19)
  - Injury, poisoning or certain other consequences of external causes (Chapter 22)
  - Neoplasms (Chapter 02)
  - Endocrine, nutritional or metabolic diseases (Chapter 05)

- Coded Elsewhere:**
- Structural developmental anomalies of the ear (LA20-LA2Z)
  - Symptoms, signs or clinical findings of ear or mastoid process (MC40-MC6Y)

This chapter contains the following top level blocks:

- Diseases of external ear
- Diseases of middle ear or mastoid
- Diseases of inner ear
- Disorders with hearing impairment
- Disorders of ear, not elsewhere classified
- Postprocedural disorders of ear or mastoid process

## Diseases of external ear (AA00-AA6Z)

**Coded Elsewhere:** Inflammatory disorders of the external ear (EG40-EG4Z)

Infectious diseases of external ear (AA00-AA0Z)

**Coded Elsewhere:** Erysipelas of external ear (1B70.01)

Candida otomycosis (1F23.16)

Herpes simplex infection of external ear (1F00.0Y)

Otitis externa due to zoster (1E91.Y)

**AA00**

### Abscess of external ear

A fluctuant collection of purulent exudate and necrotic tissue located in the external auditory canal or in the soft tissues of the pinna, most commonly due to *Staphylococcus aureus*.

**AA01**

### Cellulitis of external ear

A diffuse subacute bacterial infection of the soft tissues of the external ear, most commonly due to beta-haemolytic streptococci. It may arise within an apparently healthy external ear but may complicate both inflammatory and infective forms of otitis externa.

**Exclusions:** Erysipelas of external ear (1B70.01)

Staphylococcal cellulitis of skin (1B70.2)

Streptococcal cellulitis of skin (1B70.1)

**AA02**

### Malignant otitis externa

Malignant otitis externa is a rare life-threatening infective complication of otitis externa. It is due in the majority of cases to *Pseudomonas aeruginosa*. Organisms penetrate from the external ear canal into the surrounding deeper tissues resulting in osteomyelitis of the temporal bone and risks of damage to adjacent cranial nerves and septic thrombo-emboli to the brain. Advanced age, uncontrolled diabetes mellitus and immunosuppression are risk factors.

**AA03**

### Otomycosis

Fungal infection of the ear. Otomycosis is due to *Aspergillus* spp., especially *A. niger*, in 75% or more of cases and *Candida* in most of the remainder.

**Coded Elsewhere:** *Aspergillus* otomycosis (1F20.10)

Candida otomycosis (1F23.16)

**AA04**

### Perichondritis of external ear

Perichondritis is an infection of the tissue surrounding the cartilage of the outer ear, the perichondrium. It usually results from injury to the ear from ear surgery, ear piercing (especially piercing of the cartilage), or trauma from contact sports. The most common bacterium causing perichondritis is *Pseudomonas aeruginosa*. Presenting features include pain, redness and swelling of the auricle, and fever.

**AA0Y**

### Other specified infectious diseases of external ear

**AA0Z**

### Infectious diseases of external ear, unspecified

## Otitis externa (AA10-AA3Z)

Inflammation of the outer ear including the external ear canal, cartilages of the auricle, and the tympanic membrane.

## Noninfectious inflammation of external ear (AA10-AA1Z)

**Coded Elsewhere:** Contact dermatitis of external ear (EG40)

Juvenile spring eruption (EJ30.0)

**AA10**

### **Seborrhoeic otitis externa**

Seborrhoeic dermatitis affecting the skin of the external ear. It is usually accompanied by evidence of seborrhoeic dermatitis at other sites. In mild cases it may be asymptomatic but it can present acutely with severe pain, oedema and exudation. Longstanding cases may be complicated by chronic lymphoedema and occlusion of the external auditory canal.

**Exclusions:** Seborrhoea (ED91.2)

**AA11**

### **Acute noninfectious otitis externa**

Rapid onset of eczematous inflammation of the outer ear the cause of which cannot be more precisely classified.

**Exclusions:** Acute seborrhoeic otitis externa (AA10)

Allergic contact dermatitis of external ear (EG40.0)

Irritant contact dermatitis of external ear (EK02.10)

**AA12**

### **Chondrodermatitis nodularis**

A common pressure-induced painful nodule or ulcer affecting the external ear. It results from ischaemia of skin and underlying cartilage from a focal point of high pressure from the weight of the recumbent head. The site of involvement is dependent on the shape of the pinna (most commonly the helix is involved but in some individuals it is the antihelix which is more prominent) and whether the sufferer is limited to sleeping on one side and is thus unable to spare the ear from constant pressure when lying in bed.

**AA13**

### **Chronic otitis externa**

**AA1Y**

### **Other specified noninfectious inflammation of external ear**

**AA1Z**

### **Noninfectious inflammation of external ear, unspecified**

---

**AA3Y**

### **Other specified otitis externa**

**Coding Note:** Code also the causing condition

**AA3Z**

### **Otitis externa, unspecified**

**Coding Note:** Code also the causing condition

Noninflammatory disorders of the external ear (AA40-AA4Z)

Miscellaneous noninflammatory disorders involving the external ear.

**Coded Elsewhere:** Ear-lobe keloid (EE60.00)

Acanthoma fissuratum (EH92.Y)

**AA40 Acquired deformity of external auditory canal**

**AA40.0 Exostosis of external auditory canal**

**AA40.1 Acquired stenosis of external auditory canal**

Acquired stenosis of external auditory canal was described as resulting from a number of different causes. Since then, histology and imaging studies of this disease have shown that a common cascade of inflammatory changes resulting from these different causes is the primary pathogenesis leading to medial canal fibrosis. Once there is complete obstruction of the external auditory canal, surgery is the primary treatment.

**AA40.2 Cholesteatoma of external auditory canal**

**AA40.Y Other specified acquired deformity of external auditory canal**

**AA41 Acquired deformity of pinna**

Acquired deformities involving the external ear.

*Inclusions:* Acquired deformity of auricle

**AA41.0 Cauliflower ear**

Cauliflower ear is the end result of fibrosis of the skin and soft tissues of the pinna following a traumatic subperichondrial haematoma, usually due to trauma. It manifests as permanent swelling and deformity of the ear, described as resembling a cauliflower. It is found most commonly amongst men involved in contact sports such as boxing, wrestling, martial arts and rugby football.

**AA41.Y Other specified acquired deformity of pinna**

**AA42 Impacted cerumen**

Impacted cerumen is the presence of occlusive aural wax in the external ear canal. Wax may cause tinnitus or otalgia and removal may be required to allow adequate otoscopic examination and/or alleviate symptoms.

**AA4Y Other specified noninflammatory disorders of the external ear**

**AA4Z Noninflammatory disorders of the external ear, unspecified**

---

**AA6Z Diseases of external ear, unspecified**

## Diseases of middle ear or mastoid (AA80-AB1Z)

Middle ear, derived from the first pharyngeal (branchial) pouch; has the malleus and incus and stapes and includes the spaces of the epitympanum and mesotympanum and hypotympanum. The mastoid; normally contains "air"; the lateral boundary of the mesotympanum is where the tympanic membrane is, or normally would be located.

**Coded Elsewhere:** Congenital conductive hearing loss (AB50.0)

Otosclerosis (AB33)

Congenital mixed conductive and sensorineural hearing loss (AB50.2)

## Otitis media (AA80-AA0Z)

### Non-suppurative otitis media (AA80-AA8Z)

**AA80**

#### **Acute serous or mucoid otitis media**

Acute serous or mucoid otitis media is a collection of non-infected fluid in the middle ear that has developed as a result of an upper respiratory infection.

**AA81**

#### **Acute nonserous nonsuppurative otitis media**

**Exclusions:** Otitic barotrauma (NF04.0)

**AA82**

#### **Chronic serous or mucoid otitis media**

Chronic serous or mucoid otitis media is probably the most common form of subacute middle ear disease found in the developed world. It typically lingers following otitis media, when the fluid in the ear, formed by the infection, does not clear spontaneously. The tympanic membrane is intact but the middle ear is liquid-fluid filled. This presumably puts the middle ear at risk for further infection and often worsens hearing by about 30 dB. This is most frequently found in children and can interfere with language acquisition and learning.

**AA83**

#### **Noninfected otitis media with effusion**

**AA8Z**

#### **Nonsuppurative otitis media, unspecified**

### Suppurative otitis media (AA90-AA9Z)

This involves a perforation (hole) in the tympanic membrane and active bacterial infection within the middle ear space for several weeks or more. There may be enough pus that it drains to the outside of the ear (otorrhea), or the purulence may be minimal enough to only be seen on examination using a binocular microscope, unspecified.

**AA90**

#### **Acute suppurative otitis media**

Acute suppurative otitis media is defined as an inflammation of the middle ear which erupts suddenly and passes quickly. It is characteristic to have a middle-ear infection behind a reddened eardrum.

**AA91**

#### **Chronic suppurative otitis media**

<b>AA91.0</b>	<b>Chronic tubotympanic suppurative otitis media</b> Having a tympanic membrane perforation for at least three months, chronic suppurative otitis media has traditionally been classified into safe and unsafe type. Chronic tubotympanic suppurative otitis media is considered "safe" (meaning it is unlikely to become a worse problem for the patient) if it involves a central perforation of the pars tensa with the inflammatory process affecting the mucosa of the middle ear cleft.
	<b>Inclusions:</b> Benign chronic suppurative otitis media Chronic tubotympanic disease
<b>AA91.1</b>	<b>Chronic atticoantral suppurative otitis media</b> Chronic suppurative otitis media has traditionally been classified into safe and unsafe type. Chronic atticoantral suppurative otitis media which is unsafe type is typified by a marginal perforation of the posterosuperior pars tensa or pars flaccida.
	<b>Inclusions:</b> Chronic atticoantral disease
<b>AA91.2</b>	<b>Other chronic suppurative otitis media</b> This involves a perforation (hole) in the tympanic membrane and active bacterial infection within the middle ear space for several weeks or more. There may be enough pus that it drains to the outside of the ear (otorrhea), or the purulence may be minimal enough to only be seen on examination using a binocular microscope.
<b>AA91.Z</b>	<b>Chronic suppurative otitis media, unspecified</b>
<b>AA9Z</b>	<b>Suppurative otitis media, unspecified whether acute or chronic</b>
<b>AB00</b>	<b>Acute otitis media</b> <b>Coded Elsewhere:</b> Acute nonserous nonsuppurative otitis media (AA81) Acute suppurative otitis media (AA90)
<b>AB01</b>	<b>Chronic otitis media</b> <b>Coded Elsewhere:</b> Chronic serous or mucoid otitis media (AA82) Chronic suppurative otitis media (AA91)
<b>AB0Y</b>	<b>Other specified otitis media</b> <b>Coding Note:</b> Code also the causing condition
<b>AB0Z</b>	<b>Otitis media, unspecified</b> <b>Coding Note:</b> Code also the causing condition
<b>AB10</b>	<b>Disorders of Eustachian tube</b>
<b>AB10.0</b>	<b>Diverticulum of Eustachian tube</b>
<b>AB10.1</b>	<b>Patulous Eustachian tube</b>
<b>AB10.2</b>	<b>Eustachian salpingitis</b>

<b>AB10.3</b>	<b>Obstruction of Eustachian tube</b>
	<p><b>Inclusions:</b></p> <ul style="list-style-type: none"> <li>Compression of Eustachian tube</li> <li>Stricture of Eustachian tube</li> </ul>
<b>AB10.Y</b>	<b>Other specified disorders of Eustachian tube</b>
<b>AB10.Z</b>	<b>Disorders of Eustachian tube, unspecified</b>
<b>AB11</b>	<b>Mastoiditis or related conditions</b>
<b>AB11.0</b>	<b>Acute mastoiditis</b> Rapid onset inflammation of the mastoid bone, located in the skull just behind the ear. It is often a complication of otitis media.
<b>AB11.1</b>	<b>Chronic mastoiditis</b> Persistent or recurrent inflammation of the space in the mastoid bone. It is often a complication of otitis media.
<b>AB11.2</b>	<b>Petrositis</b>
<b>AB11.3</b>	<b>Mastoiditis, not elsewhere classified</b>
<b>AB11.Y</b>	<b>Other specified mastoiditis or related conditions</b>
<b>AB12</b>	<b>Cholesteatoma of middle ear</b>
	<p><b>Exclusions:</b></p> <ul style="list-style-type: none"> <li>Recurrent cholesteatoma of postmastoidectomy cavity (AB90)</li> <li>Cholesteatoma of external auditory canal (AA40.2)</li> </ul>
<b>AB13</b>	<b>Perforation of tympanic membrane</b>
	<p><b>Exclusions:</b></p> <ul style="list-style-type: none"> <li>Traumatic rupture of ear drum (NA0A.2)</li> </ul>
<b>AB13.0</b>	<b>Central perforation of tympanic membrane</b> A temporary or persistent opening in the central portion of the tympanic membrane. Clinical signs depend on the size, location, and associated pathological condition.
<b>AB13.1</b>	<b>Attic perforation of tympanic membrane</b>
	<p><b>Inclusions:</b></p> <ul style="list-style-type: none"> <li>Perforation of pars flaccida</li> </ul>
<b>AB13.2</b>	<b>Other marginal perforations of tympanic membrane</b>
<b>AB13.Y</b>	<b>Other specified perforation of tympanic membrane</b>
<b>AB13.Z</b>	<b>Perforation of tympanic membrane, unspecified</b>

**AB14****Acute myringitis**

Myringitis is the inflammation of the tympanic membrane, often involving painful blisters on the tympanic membrane. It can develop as self-maintained primary disease of the TM (primary myringitis) or as an effect of an inflammatory process of adjacent tissues of the external or middle ear (secondary myringitis). Myringitis may be accompanied by hearing impairment and a sensation of congestion and earache. It is generally a viral or bacterial infection and may occur with otitis media. After 3 weeks, acute myringitis becomes subacute and, within 3 months, chronic.

**Inclusions:** Acute tympanitis

**Exclusions:** Acute myringitis with otitis media (AB00)

**AB15****Chronic myringitis**

Persistent or recurrent inflammation of the tympanic membrane.

**Inclusions:** Chronic tympanitis

**Exclusions:** Chronic myringitis with otitis media (AB01)

**AB16****Tympanosclerosis**

Tympanosclerosis is a scarring process with a remarkable variability in its localization within the middle ear. It can lead to conductive hearing loss.

**AB17****Adhesive middle ear disease**

**Inclusions:** Adhesive otitis

**Exclusions:** glue ear (AA82)

**AB18****Discontinuity or dislocation of ear ossicles****AB19****Acquired abnormalities of ear ossicles not related to discontinuity or dislocation****AB1A****Polyp of middle ear****AB1A.0****Aural polyp****AB1A.Y****Other specified polyp of middle ear****AB1A.Z****Polyp of middle ear, unspecified****AB1B****Middle ear cicatrix****AB1Y****Other specified diseases of middle ear or mastoid****AB1Z****Diseases of middle ear or mastoid, unspecified**

## Diseases of inner ear (AB30-AB3Z)

**Coded Elsewhere:** Congenital mixed conductive and sensorineural hearing loss (AB50.2)

Congenital sensorineural hearing loss (AB50.1)

**AB30**

### **Acute vestibular syndrome**

A clinical syndrome of acute-onset, continuous vertigo, dizziness, or unsteadiness lasting days to weeks, and generally including features suggestive of new, ongoing vestibular system dysfunction (e.g., vomiting, nystagmus, severe postural instability). There may also be symptoms or signs suggesting cochlear or central nervous system dysfunction. Acute vestibular syndrome usually connotes a single, monophasic event, often caused by a one-time disorder, but it may instead punctuate a relapsing-and-remitting or stepwise, progressive illness course. Disorders typically presenting this syndrome include vestibular neuritis, acute labyrinthitis, traumatic vestibulopathy, demyelinating disease with vestibular involvement, and strokes affecting central or peripheral vestibular structures.

**Coding Note:** Code also the causing condition

**AB30.0      Vestibular neuritis**

Vestibular neuritis (also known as vestibular neuronitis) may be described as acute, sustained dysfunction of the peripheral vestibular system with secondary nausea, vomiting, and vertigo. Important negative features include aural fullness and hearing loss.

**AB30.1      Labyrinthitis**

Labyrinthitis is an inflammatory disorder of the inner ear (labyrinth) producing disturbances of balance and hearing to varying degrees. It can be caused by bacterial or viral infections and autoimmune processes.

**AB30.Y      Other specified acute vestibular syndrome**

**Coding Note:** Code also the causing condition

**AB30.Z      Acute vestibular syndrome, unspecified**

**Coding Note:** Code also the causing condition

**AB31**

### **Episodic vestibular syndrome**

A clinical syndrome of transient vertigo, dizziness, or unsteadiness lasting seconds to hours, occasionally days, and generally including features suggestive of temporary, short-lived vestibular system dysfunction (e.g., nausea, nystagmus, sudden falls). There may also be symptoms or signs suggesting cochlear or central nervous system dysfunction. Episodic vestibular syndrome usually connotes multiple, recurrent events caused by an episodic disorder with repeated spells (triggered or spontaneous), but may initially present after the first event.

**Coded Elsewhere:** Benign paroxysmal vertigo of childhood (8A80.Y)

- AB31.0 Meniere disease**  
Meniere Disease (MD) is a chronic progressive inner ear disease, with endolymphatic hydrops. It is characterised by recurrent attacks of debilitating spontaneous vertigo lasting from 20 minutes to up to 12 hours, accompanied by a sense of fullness and tinnitus in the affected ear, and ipsilateral fluctuating sensorineural hearing loss (SNHL) in the low or low and middle frequencies. There may be nystagmus during attacks and falls are frequent. When known, etiology should be added.
- Inclusions:** Labyrinthine hydrops
- AB31.1 Vestibular migraine**  
Recurrent attacks of moderate to severe vestibular symptoms lasting from 5 minutes to 72 hours in patients with a past or ongoing history of migraine headaches. Vestibular symptoms are usually spontaneous and positional vertigo, head motion-induced and visual vertigo as well as head motion-induced dizziness with nausea. Attacks of vestibular symptoms may occur together or independently of migraine symptoms like headache, photophobia, phonophobia or visual aura.
- AB31.2 Benign positional paroxysmal vertigo**  
Benign paroxysmal positional vertigo is defined as an abnormal sensation of motion that is elicited by certain critical provocative physical positions of the patient (e.g. becoming dorsal recumbent). The provocative positions usually trigger specific eye movements (e.g. nystagmus). The character and direction of the nystagmus is specific to the part of the inner ear affected and the underlying pathophysiology.
- AB31.3 Superior canal dehiscence syndrome**  
Superior canal dehiscence syndrome (SCDS) occurs when thin or dehiscent bone over the superior semicircular canal, best demonstrated on CT, allows pressure transmission between the canal and the intracranial space. Vertigo and nystagmus may occur when the canal is stimulated by loud sounds or changes in middle ear or intracranial pressure. Hyperacusis to bone-conducted sounds can cause conductive hearing loss, pulsatile tinnitus, or autophony (hearing one's own body sounds as loud or distorted). While the bony defect may be congenital, head trauma can be the final step that opens a functionally mobile labyrinthine window.
- AB31.4 Disembarkment syndrome**  
Disembarkment syndrome, or Mal de débarquement (MdD) occurs when habituation to unfamiliar motion patterns like traveling on a boat, train, or airplane, becomes resistant to re-adaption on return to stable conditions. It results in an illusion of self motion typically described as rocking, bobbing, or swaying. Brief periods of MdD (hours) are common in healthy individuals, this otherwise natural phenomenon can become persistent in some individuals.
- AB31.5 Autoimmune inner ear disease**  
Autoimmune inner ear disease (AIID) is a clinical syndrome of bilateral sensorineural hearing loss (SNHL) >30dB at one or more frequencies progressing over a period of 3-90 days. Progression of SNLH >15dB at one frequency or >10dB in two frequencies in at least one ear should be demonstrated. Vestibular symptoms may be present in 50% of patients and systemic autoimmune disease (SAD) coexists in 30% of patients.

<b>AB31.6</b>	<b>Vestibular paroxysmia</b> Vestibular paroxysmia (VP) is characterised by recurrent spells of vertigo or dizziness, lasting seconds to minutes, often many times a day. Attacks usually occur spontaneously but may occasionally be induced by changes of head position (which then needs to be distinguished from benign paroxysmal positioning vertigo). Possible accompanying symptoms are short attacks of tinnitus or changes in hearing. In the attack-free interval mild to moderate impairments of vestibular or audiological function may be found. Neurovascular cross-compression of the eighth nerve is the assumed mechanism.
<b>AB31.7</b>	<b>Vertiginous syndromes</b>
<b>AB31.Y</b>	<b>Other specified episodic vestibular syndrome</b>
<b>AB31.Z</b>	<b>Episodic vestibular syndrome, unspecified</b>
<b>AB32</b>	<b>Chronic vestibular syndrome</b> A clinical syndrome of chronic vertigo, dizziness, or unsteadiness lasting months to years and generally including features suggestive of persistent vestibular system dysfunction (e.g., oscillopsia, nystagmus, gait unsteadiness). There may also be symptoms or signs suggesting cochlear or central nervous system dysfunction. Chronic vestibular syndrome often connotes a progressive, deteriorating course, but sometimes instead reflects a stable, incomplete recovery after an acute vestibular event, or persistent, lingering symptoms between episodic vestibular events.
<b>AB32.0</b>	<b>Persistent Postural-Perceptual Dizziness</b> Persistent non-vertiginous dizziness, unsteadiness, or both lasting three months or more. Symptoms are present most days, often increasing throughout the day, but may wax and wane. Momentary flares may occur spontaneously or with sudden movement. Affected individuals feel worst when upright, exposed to moving or complex visual stimuli, and during active or passive head motion. These situations may not be equally provocative. Typically, the disorder follows occurrences of acute or episodic vestibular or balance-related problems. Symptoms may begin intermittently, and then consolidate. Gradual onset is uncommon.
<b>AB32.1</b>	<b>Chronic unilateral idiopathic vestibulopathy</b>
<b>AB32.2</b>	<b>Persistent unilateral vestibulopathy after vestibular neuritis</b>
<b>AB32.3</b>	<b>Unilateral vestibulopathy due to schwannoma</b>
<b>AB32.4</b>	<b>Unilateral vestibulopathy after medical intervention</b>
<b>AB32.5</b>	<b>Chronic bilateral vestibulopathy</b> Bilateral vestibulopathy (BVP) results from impaired vestibular function of both inner ears. It is clinically characterised by postural imbalance and unsteadiness of gait that worsens in darkness and on uneven ground, head or body movement-induced oscillopsia. If known, the etiology should be added to the diagnosis.
<b>AB32.Y</b>	<b>Other specified chronic vestibular syndrome</b>
<b>AB32.Z</b>	<b>Chronic vestibular syndrome, unspecified</b>

**AB33****Otosclerosis**

Otosclerosis is a genetically mediated metabolic bone disease that affects the otic capsule and stapes. It is an autosomal dominant disorder with varying penetrance and expressivity. Usually symptomatic hearing loss from otosclerosis develops early in the third decade of life, although onset in the teenage years does occur.

*Inclusions:*            otospongiosis

**AB34****Disorders of vestibular function**

*Exclusions:*            vertigo: NOS (MB48.0)

vertigo: epidemic (1C80-1C8Z)

**AB34.0****Idiopathic bilateral vestibulopathy**

This results as the culmination of damage done to both inner ears and causes problems in vision, hearing and motor coordination.

**AB34.1****Other peripheral vertigo****AB34.Y****Other specified disorders of vestibular function****AB34.Z****Disorders of vestibular function, unspecified****AB35****Labyrinthine fistula**

Labyrinthine fistula is a condition in which an abnormal communication is present between the perilymphatic space of the inner ear and the middle ear (usually at or adjacent to the round or oval window). The manifestations of this disease vary in severity and complexity, commonly ranging from very mild to incapacitating.

**AB36****Labyrinthine dysfunction****AB37****Noise effects on inner ear**

Noise toxicity can cause hearing loss, either transient or permanent, and impairment. Noise-induced hearing loss typically begins in the high-pitched frequency range of human voices communication.

*Inclusions:*            Noise-induced hearing loss

**AB3Y****Other specified diseases of inner ear****AB3Z****Diseases of inner ear, unspecified**

## Disorders with hearing impairment (AB50-AB5Z)

**Exclusions:** Otosclerosis (AB33)

**AB50**

### **Congenital hearing impairment**

Both dominant and recessive genes exist which can cause mild to profound impairment. If a family has a dominant gene for deafness it will persist across generations because it will manifest itself in the offspring even if it is inherited from only one parent. If a family had genetic hearing impairment caused by a recessive gene it will not always be apparent as it will have to be passed onto offspring from both parents. Hearing impairment is sustained before the acquisition of language, which occurs due to a congenital condition.

**AB50.0** **Congenital conductive hearing loss**

**AB50.1** **Congenital sensorineural hearing loss**

**AB50.2** **Congenital mixed conductive and sensorineural hearing loss**

**AB50.Y** **Other specified congenital hearing impairment**

**AB50.Z** **Congenital hearing impairment, unspecified**

**AB51**

### **Acquired hearing impairment**

Loss of hearing that occurs sometime the course of life and is not present at birth. The hearing impairment is sustained after the acquisition of language, which can occur due to disease, trauma, or as a side-effect of a medicine. Conductive hearing loss may occur as a result of a problem in the outer or middle ear such as an obstruction (cerumen, foreign body), damage to the ossicles, middle ear infections, and/or perforation of the tympanic membrane. Sensorineural hearing loss is a type of hearing loss in which the root cause lies in the vestibulocochlear nerve (Cranial nerve VIII), the inner ear, or central processing centres of the brain. Mixed conductive and sensorineural hearing loss refers to a mix of both conductive and sensorineural hearing loss.

**Exclusions:** noise-induced hearing loss (AB37)

Ototoxic hearing loss (AB53)

Sudden idiopathic hearing loss (AB55)

deafness NOS (AB52)

Deaf mutism, not elsewhere classified (AB50-AB5Z)

**AB51.0** **Acquired conductive hearing loss**

Conductive hearing loss occurs when there is a problem conducting sound waves anywhere along the route through the outer ear, tympanic membrane (eardrum), or middle ear (ossicles), bilateral.

**AB51.1** **Acquired sensorineural hearing loss**

Sensorineural hearing loss is a type of hearing loss in which the root cause lies in the vestibulocochlear nerve (Cranial nerve VIII), the inner ear, or central processing centres of the brain.

<b>AB51.2</b>	<b>Acquired mixed conductive and sensorineural hearing loss</b>
	Conductive hearing loss occurs when there is a problem conducting sound waves anywhere along the route through the outer ear, tympanic membrane (eardrum), or middle ear (ossicles). Sensorineural hearing loss is a type of hearing loss in which the root cause lies in the vestibulocochlear nerve (Cranial nerve VIII), the inner ear, or central processing centres of the brain. This diagnosis refers to a mix of both conductive and sensorineural hearing loss.
<b>AB51.Y</b>	<b>Other specified acquired hearing impairment</b>
<b>AB51.Z</b>	<b>Acquired hearing impairment, unspecified</b>
<b>AB52</b>	<b>Deafness not otherwise specified</b>
<b>AB53</b>	<b>Ototoxic hearing loss</b>
<b>AB54</b>	<b>Presbycusis</b>
	The term presbycusis refers to sensorineural hearing impairment in elderly individuals. Characteristically, presbycusis involves bilateral high-frequency hearing loss associated with difficulty in speech discrimination and central auditory processing of information.
	<i>Inclusions:</i> Presbyacusia
<b>AB55</b>	<b>Sudden idiopathic hearing loss</b>
<b>AB56</b>	<b>Hereditary hearing loss</b>
	<i>Exclusions:</i> Congenital hearing impairment (AB50)
	Acquired hearing impairment (AB51)
<b>AB57</b>	<b>Auditory synaptopathy or neuropathy</b>
	Normal outer hair cell function but lacking synchrony of neural transmission of auditory information due to damage of inner hair cells or their synapses or of the spiral ganglion cells or of the auditory nerve
<b>AB5Y</b>	<b>Other specified disorders with hearing impairment</b>
<b>AB5Z</b>	<b>Disorders with hearing impairment, unspecified</b>

Disorders of ear, not elsewhere classified (AB70-AB7Y)	
<i>Exclusions:</i>	Tinnitus (MC41)
<b>AB70</b>	<b>Otalgia or effusion of ear</b>
<i>Exclusions:</i>	Otitis media (AA80-AB0Z)
	Chronic primary orofacial pain (MG30.03)
	Chronic secondary headache or orofacial pain (MG30.6)

<b>AB70.0</b>	<b>Otorrhoea</b>
	<b><i>Exclusions:</i></b> leakage of cerebrospinal fluid through ear (8D63) Otorrhagia (AB70.1)
<b>AB70.1</b>	<b>Otorrhagia</b>
	<b><i>Exclusions:</i></b> traumatic otorrhagia - code by type of injury (Chapter 22)
<b>AB70.2</b>	<b>Otalgia</b> Pain in one or both ears.
	<b><i>Exclusions:</i></b> Chronic primary orofacial pain (MG30.03) Chronic secondary headache or orofacial pain (MG30.6)
<b>AB71</b>	<b>Degenerative or vascular disorders of ear</b>
	<b><i>Exclusions:</i></b> Presbycusis (AB54)
<b>AB72</b>	<b>Disorders of acoustic nerve</b>
	<b><i>Inclusions:</i></b> Disorder of 8th cranial nerve
<b>AB72.0</b>	<b>Acoustic neuritis</b>
	<b><i>Coding Note:</i></b> Code also the causing condition
<b>AB72.Y</b>	<b>Other specified disorders of acoustic nerve</b>
<b>AB72.Z</b>	<b>Disorders of acoustic nerve, unspecified</b>
<b>AB73</b>	<b>Atrophy ear</b>
<b>AB7Y</b>	<b>Other specified disorders of ear, not elsewhere classified</b>

Postprocedural disorders of ear or mastoid process (AB90-AB93)

<b>AB90</b>	<b>Recurrent cholesteatoma of postmastoidectomy cavity</b>
<b>AB91</b>	<b>Mucosal cyst of postmastoidectomy cavity</b>
<b>AB92</b>	<b>Granulation of postmastoidectomy cavity</b>
<b>AB93</b>	<b>Chronic inflammation of postmastoidectomy cavity</b>

---

<b>AC0Y</b>	<b>Other specified diseases of the ear or mastoid process</b>
<b>AC0Z</b>	<b>Diseases of the ear or mastoid process, unspecified</b>

# CHAPTER 11

---

## Diseases of the circulatory system

This chapter has 161 four-character categories.

Code range starts with BA00

This refers to diseases of the organ system that passes nutrients (such as amino acids, electrolytes and lymph), gases, hormones, blood cells, etc. to and from cells in the body to help fight diseases, stabilize body temperature and pH, and to maintain homeostasis.

- Exclusions:**
- Certain infectious or parasitic diseases (Chapter 01)
  - Certain conditions originating in the perinatal period (Chapter 19)
  - Congenital malformations, deformations and chromosomal abnormalities (Chapter 20)
  - Complications of pregnancy, childbirth and the puerperium (Chapter 18)
  - Injury, poisoning or certain other consequences of external causes (Chapter 22)
  - Endocrine, nutritional or metabolic diseases (Chapter 05)

- Coded Elsewhere:**
- Neoplasms of the circulatory system
  - Developmental anomalies of the circulatory system
  - Infections of the circulatory system
  - Symptoms, signs or clinical findings of the circulatory system (MC80-MC9Y)
  - Cerebrovascular diseases (8B00-8B2Z)
  - Functional vascular disorders of the skin (EG00-EG02)
  - Diseases of the circulatory system complicating pregnancy, childbirth or the puerperium (JB64.4)

This chapter contains the following top level blocks:

- Hypertensive diseases
- Hypotension
- Ischaemic heart diseases
- Diseases of coronary artery
- Pulmonary heart disease or diseases of pulmonary circulation
- Pericarditis
- Acute or subacute endocarditis
- Heart valve diseases
- Diseases of the myocardium or cardiac chambers
- Cardiac arrhythmia

- Heart failure
- Diseases of arteries or arterioles
- Diseases of veins
- Disorders of lymphatic vessels or lymph nodes
- Postprocedural disorders of circulatory system
- Neoplasms of the circulatory system
- Developmental anomalies of the circulatory system
- Infections of the circulatory system

## Hypertensive diseases (BA00-BA04.Z)

Although a continuous association exists between higher BP and increased cardiovascular disease risk, it is useful to categorize BP levels for clinical and public health decision making. Recent guidelines categorise systemic hypertension into 4 levels on the basis of average BP measured in a healthcare setting (office pressures):

- Normal: systolic BP < 120 mmHg and diastolic BP < 80 mmHg
- Elevated: systolic BP 120-129 mmHg and diastolic BP < 80 mmHg
- Stage 1 hypertension: systolic BP 130-139 mmHg or diastolic BP 80-89 mmHg
- Stage 2 hypertension: systolic BP 140 mmHg or more, diastolic BP 90 mmHg or more

In children, systemic hypertension is defined as an average systolic or diastolic blood pressure equal or higher than the 95th percentile appropriate for the sex, age and height of the child.

The complications of uncontrolled or prolonged hypertension include damage to the blood vessels, heart, kidneys and brain.

- Exclusions:**
- Pulmonary hypertension (BB01)
  - involving coronary vessels (BA40-BA6Z)
  - Oedema, proteinuria, or hypertensive disorders in pregnancy, childbirth, or the puerperium (JA20-JA2Z)
  - White coat hypertension (MC80.00)

**Coded Elsewhere:** Neonatal hypertension (KB45)

<b>BA00</b>	<b>Essential hypertension</b>
	Essential (primary) hypertension, accounting for 95% of all cases of hypertension, is defined as high blood pressure for which a secondary cause cannot be found.
	<b>Inclusions:</b> high blood pressure
	<b>Exclusions:</b> Cerebrovascular diseases (8B00-8B2Z)

Background retinopathy and retinal vascular changes (9B78.1)

**Coded Elsewhere:** Pre-existing essential hypertension complicating pregnancy, childbirth or the puerperium (JA20.0)

<b>BA00.0</b>	<b>Combined diastolic and systolic hypertension</b>
---------------	---

- BA00.1**      **Isolated diastolic hypertension**
- BA00.2**      **Isolated systolic hypertension**
- BA00.Y**      **Other specified essential hypertension**
- BA00.Z**      **Essential hypertension, unspecified**

### **BA01      Hypertensive heart disease**

Uncontrolled and prolonged hypertension can lead to a variety of changes in the myocardial structure, coronary vasculature, and conduction system of the heart. Hypertensive heart disease is a term applied generally to heart diseases, such as left ventricular hypertrophy, coronary artery disease, cardiac arrhythmias, and congestive heart failure, that are caused by direct or indirect effects hypertension.

**Coded Elsewhere:** Pre-existing hypertensive heart disease complicating pregnancy, childbirth or the puerperium (JA20.1)

Pre-existing hypertensive heart and renal disease complicating pregnancy, childbirth or the puerperium (JA20.3)

### **BA02      Hypertensive renal disease**

Hypertensive renal disease is a medical condition referring to damage to the kidney due to chronic high blood pressure.

**Inclusions:**      hypertensive nephropathy

**Exclusions:**      Secondary hypertension (BA04)

**Coded Elsewhere:** Pre-existing hypertensive renal disease complicating pregnancy, childbirth or the puerperium (JA20.2)

Pre-existing hypertensive heart and renal disease complicating pregnancy, childbirth or the puerperium (JA20.3)

### **BA03      Hypertensive crisis**

**Coding Note:** Code also the causing condition

### **BA04      Secondary hypertension**

Defined through the measurement of the blood pressure using cuff method with a sitting systolic blood pressure above 140 mmHg or a sitting diastolic blood pressure above 90 mmHg in three consequent measurements with an identifiable cause.

**Coding Note:** Code also the causing condition

**Exclusions:**      involving vessels of brain (8B00-8B2Z)

                        involving vessels of eye (9B78.1)

**Coded Elsewhere:** Congenital renal artery stenosis (LA90.40)

                        Hyperaldosteronism (5A72)

Pre-existing secondary hypertension complicating pregnancy, childbirth or the puerperium (JA20.4)

### **BA04.0      Combined diastolic and systolic secondary hypertension**

### **BA04.1      Isolated diastolic secondary hypertension**

### **BA04.2      Isolated systolic secondary hypertension**

**BA04.Y**      **Other specified secondary hypertension**

**Coding Note:** Code also the causing condition

**BA04.Z**      **Secondary hypertension, unspecified**

**Coding Note:** Code also the causing condition

## Hypotension (BA20-BA2Z)

**Exclusions:**     cardiovascular collapse (MG40)  
                  Nonspecific low blood-pressure reading (MC80.1)  
                  Maternal hypotension syndrome (JA65.6)

**Coded Elsewhere:** Intracranial hypotension (8D61)

Neonatal hypotension (KB46)

**BA20**      **Idiopathic hypotension**

**BA21**      **Orthostatic hypotension**

**Exclusions:**     Shy-Drager syndrome (8D87.0)

**BA2Y**      **Other specified hypotension**

**BA2Z**      **Hypotension, unspecified**

## Ischaemic heart diseases (BA40-BA6Z)

Acute ischaemic heart disease (BA40-BA4Z)

**Inclusions:**     acute coronary syndrome

**BA40**      **Angina pectoris**

**Inclusions:**     Anginal syndrome  
                  Ischaemic chest pain  
                  Angina NOS

**Exclusions:**     Otocephaly (LA23)

**Coded Elsewhere:** Microvascular angina (BA86)

**BA40.0**      **Unstable angina**

**Inclusions:**     Preinfarction syndrome  
                  worsening effort angina

**BA40.1**      **Stable angina**

**BA40.Y**      **Other specified angina pectoris**

**BA40.Z**      **Angina pectoris, unspecified**

**BA41**

### **Acute myocardial infarction**

The term acute myocardial infarction (MI) should be used when there is evidence of myocardial necrosis in a clinical setting consistent with acute myocardial ischemia. Under these conditions any one of the following criteria meets the diagnosis for MI;

Detection of a rise and/or fall of cardiac biomarker values with at least one value above the 99th percentile upper reference limit and with at least one of the following;

- a. Symptoms of ischaemia.
- b. New or presumed new significant ST-segment-T wave (ST-T) changes or new left bundle branch block (LBBB) in the electrocardiogram (ECG).
- c. Development of pathologic Q waves in the electrocardiogram (ECG).
- d. Imaging evidence of new loss of viable myocardium or new regional wall motion abnormality.
- e. Identification of an intracoronary thrombus by angiography or autopsy.

Infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction (WHO)

***Inclusions:***

postmyocardial infarction syndrome (BA60.0)

Subsequent myocardial infarction (BA42)

Certain current complications following acute myocardial infarction (BA60)

Old myocardial infarction (BA50)

**BA41.0**

### **Acute ST elevation myocardial infarction**

STEMI is an acute myocardial infarction with developing ST elevation in two contiguous leads. The criteria of ST elevation are as follows: New ST elevation at the J point in two contiguous leads where these cut points apply: 0.2mV in men > 40 years, > 0.25mV in men < 40 years, and > 0.15 mV in women.

**BA41.1**

### **Acute non-ST elevation myocardial infarction**

**BA41.Z**

### **Acute myocardial infarction, unspecified**

**BA42**

### **Subsequent myocardial infarction**

Infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction

***Inclusions:***

extension of myocardial infarction

recurrent myocardial infarction

***Exclusions:***

specified as chronic or with a stated duration of more than 4 weeks (more than 28 days) from onset (BA50)

**BA42.0**

### **Subsequent myocardial infarction, ST elevation myocardial infarction**

Extension or recurrent myocardial infarction. This category should be assigned for infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction. This most commonly results from total occlusion of the culprit coronary artery.

<b>BA42.1</b>	<b>Subsequent myocardial infarction, non-ST elevation myocardial infarction</b> Extension or recurrent myocardial infarction. For morbidity coding, this category should be assigned for infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction. This most commonly results from severe obstruction, but not total occlusion, of the culprit coronary artery.
<b>BA42.Z</b>	<b>Subsequent myocardial infarction, unspecified</b>
<b>BA43</b>	<b>Coronary thrombosis not resulting in myocardial infarction</b> Superimposed thrombus associated with plaque rupture or erosion which does not obstruct the coronary flow to cause myocardial infarction.  <i>Inclusions:</i> Occlusion of coronary artery or vein not resulting in myocardial infarction Embolism of coronary artery or vein not resulting in myocardial infarction Thromboembolism of coronary artery or vein not resulting in myocardial infarction
<b>BA4Z</b>	<b>Acute ischaemic heart disease, unspecified</b>
	Chronic ischaemic heart disease (BA50-BA5Z) Chronic heart disease is seen due to the atherosclerosis of coronary arteries. It is characterised by angina pectoris and unstable angina.
<b>BA50</b>	<b>Old myocardial infarction</b> Past myocardial infarction diagnosed by electrocardiogram (ECG) or other special investigation, but currently presenting no symptoms.  <i>Inclusions:</i> healed myocardial infarction
<b>BA51</b>	<b>Ischaemic cardiomyopathy</b> Ischaemic cardiomyopathy has been defined as left ventricular systolic dysfunction with one or more of the following: a history of prior myocardial revascularisation or myocardial infarction, more than 75% stenosis in the left main stem or left anterior descending artery, or two vessels or more with a greater than 75% stenosis. It consists of a spectrum of pathophysiological states that relate to perfusion contraction matching and mismatching, including myocardial infarction, stunning, hibernation and scarring.
<b>BA51.0</b>	<b>Dilated cardiomyopathy due to congenital anomaly of coronary artery</b> Dilated cardiomyopathy due to a congenital anomaly of one or more coronary arteries, such as anomalous left coronary artery from pulmonary artery (ALCAPA), coronary ostial stenosis or atresia, right ventricular dependent coronary circulation in pulmonary atresia with an intact ventricular septum. It is a form of ischaemic cardiomyopathy causing systolic ventricular dysfunction that relates to a spectrum of perfusion contraction matching and mismatching, including myocardial infarction, stunning, hibernation and scarring.
<b>BA51.Y</b>	<b>Other specified ischaemic cardiomyopathy</b>

<b>BA51.Z</b>	<b>Ischaemic cardiomyopathy, unspecified</b>
<b>BA52</b>	<p><b>Coronary atherosclerosis</b></p> <p>Atherosclerosis is the build up inside the coronary arteries of cholesterol, fatty acids, calcium, fibrous connective tissue and cells (mostly macrophages), referred to as plaque. The effect of this is to reduce the blood flow through the coronary arteries to heart muscle and when marked results in heart damage often with symptoms such as chest pain.</p> <p><b>Inclusions:</b></p> <ul style="list-style-type: none"> <li>Coronary artery atherosclerosis</li> <li>Coronary artery atheroma</li> <li>Coronary artery sclerosis</li> <li>coronary artery ostial stenosis due to atherosclerosis</li> </ul>
<b>BA52.0</b>	<p><b>Coronary atherosclerosis of native coronary artery</b></p> <p>Atherosclerotic lesions, or atherosclerotic plaques of native coronary artery.</p> <p><b>Inclusions:</b></p> <ul style="list-style-type: none"> <li>Coronary atherosclerosis without significant ischaemia of native coronary artery</li> </ul>
<b>BA52.1</b>	<p><b>Coronary atherosclerosis of autologous bypass graft</b></p> <p>Atherosclerotic lesions, or atherosclerotic plaques of autologous bypass graft.</p> <p><b>Inclusions:</b></p> <ul style="list-style-type: none"> <li>Coronary atherosclerosis of autologous bypass graft without significant ischaemia</li> </ul>
<b>BA52.10</b>	Coronary atherosclerosis of arterial autologous bypass graft
<b>BA52.11</b>	Coronary atherosclerosis of venous autologous bypass graft
<b>BA52.1Z</b>	Coronary atherosclerosis of unspecified autologous bypass graft
<b>BA52.2</b>	<p><b>Coronary atherosclerosis of non-autologous bypass graft</b></p> <p>Atherosclerotic lesions, or atherosclerotic plaques of non-autologous bypass graft.</p> <p><b>Inclusions:</b></p> <ul style="list-style-type: none"> <li>Coronary atherosclerosis without significant ischaemia of non-autologous bypass graft</li> </ul>
<b>BA52.Z</b>	<b>Coronary atherosclerosis, unspecified site</b>
<b>BA5Y</b>	<b>Other specified chronic ischaemic heart disease</b>
<b>BA5Z</b>	<b>Chronic ischaemic heart disease, unspecified</b>
<b>BA60</b>	<p><b>Certain current complications following acute myocardial infarction</b></p> <p>Secondary conditions which may occur in the course after the heart attack. They include pericarditis, arrhythmia, cardiogenic shock, heart failure, ventricular rupture, ventricular aneurysm (with thrombus) and recurrent infarction.</p> <p><b>Exclusions:</b></p> <ul style="list-style-type: none"> <li>the listed conditions, when: not specified as current complications following acute myocardial infarction (Chapter 11)</li> <li>the listed conditions, when: concurrent with acute myocardial infarction (BA41)</li> </ul>

<b>BA60.0</b>	<b>Dressler syndrome</b> A condition of postmyocardial infarction (1 to 8 weeks), characterised by a set of associated symptom, including malaise, fever, pericardial discomfort, leukocytosis, an elevated sedimentation rate, and a pericardial effusion. Patients with this syndrome usually demonstrate localised fibrous pericarditis containing polymorphonuclear leukocytes.  <b>Inclusions:</b> Postmyocardial infarction syndrome
<b>BA60.1</b>	<b>Other pericarditis as current complication following acute myocardial infarction</b> An inflammation of the pericardium that can produce chest pain, which occurs as early as the first day and as late as 6 weeks after acute myocardial infarction. The pain of pericarditis radiates to either trapezius ridge. Transmural myocardial infarction is responsible for local pericardial inflammation. Transient pericardial friction rubs are relatively common in patients with transmural infarction within the first 48 hours. An acute fibrinous pericarditis occurs commonly after transmural infarction, whereas the risk of haemorrhagic pericarditis is increased by anticoagulation.
<b>BA60.2</b>	<b>Ventricular aneurysm as current complication following acute myocardial infarction</b> A discrete dyskinetic area of the left ventricular wall with a broad neck after acute myocardial infarction. The wall of the true aneurysm is thinner than the rest of the left ventricle; it is usually composed of fibrous tissue and necrotic muscle, occasionally mixed with viable myocardium. In contrast, pseudoaneurysms are composed of organised hematoma and pericardium and lack any elements of the original myocardial wall.
<b>BA60.3</b>	<b>Ventricular septal defect as current complication following acute myocardial infarction</b> A mechanical rupture of the interventricular septum after ST elevation myocardial infarction resulting in the left-to-right shunt to deteriorate hemodynamic, which confers a high 30-day mortality. Rupture of the septum with an anterior infarction tends to be apical in location, whereas inferior infarctions are associated with perforation of the basal septum.
<b>BA60.4</b>	<b>Cardiac rupture as current complication following acute myocardial infarction</b> A tearing of acutely infarcted tissue after acute myocardial infarction, which may involve the papillary muscles, interventricular septum, or free wall of either ventricle.
<b>BA60.5</b>	<b>Pulmonary embolism as current complication following acute myocardial infarction</b> A pulmonary embolism that resulted from thrombi in the veins of the lower extremities (e.g. after prolonged periods of bed rest) or mural thrombi overlying an area of right ventricular infarction after acute myocardial infarction.  <b>Exclusions:</b> Mural thrombus as current complication following acute myocardial infarction (BA60.7)
<b>BA60.6</b>	<b>Rupture of papillary muscle or chordae tendineae as current complication following acute myocardial infarction</b>

<b>BA60.7</b>	<b>Mural thrombus as current complication following acute myocardial infarction</b> A blood clot formed on the endoventricle or endoatrium, usually overlying dyskinetic or akinetic area of the ventricular infarction after acute myocardial infarction.
	<b><i>Exclusions:</i></b> Pulmonary embolism as current complication following acute myocardial infarction (BA60.5)
<b>BA60.8</b>	<b>Arrhythmia as current complication following acute myocardial infarction</b> A large and heterogeneous group of conditions in which the heart beats with an irregular or abnormal rhythm that can complicate the course of patients with acute myocardial infarction.
<b>BA60.9</b>	<b>Cardiogenic shock, unrelated to mechanical complications, as current complication following acute myocardial infarction</b> The most severe clinical expression of left ventricular failure and is associated with extensive damage to the left ventricular myocardium after acute myocardial infarction, unrelated to a mechanical defect such as ventricular septal or papillary muscle rupture. Shock is defined as systolic blood pressure (BP) < 90 mmHg and organ hypoperfusion.
<b>BA60.Y</b>	<b>Other specified current complications following acute myocardial infarction</b>
<b>BA60.Z</b>	<b>Certain current complications following acute myocardial infarction, unspecified</b>
<b>BA6Z</b>	<b>Ischaemic heart diseases, unspecified</b>

### Diseases of coronary artery (BA81-BA8Z)

Conditions affecting the blood perfusion of the heart.

***Coded Elsewhere:*** Coronary atherosclerosis (BA52)

Cardiac transplant associated coronary allograft vasculopathy (BE1A)

<b>BA81</b>	<b>Coronary artery aneurysm</b> Coronary dilatation which exceeds the diameter of normal adjacent segments or the diameter of the patient's largest coronary vessel by 1.5 times.
	<b><i>Exclusions:</i></b> Congenital coronary arterial aneurysm (LA8C) Mucocutaneous lymph node syndrome (4A44.5)
<b>BA81.0</b>	<b>Coronary artery aneurysm with perforation</b>
<b>BA81.1</b>	<b>Coronary artery aneurysm with rupture</b>
<b>BA81.2</b>	<b>Coronary artery aneurysm without mention of perforation or rupture</b>

**BA82****Coronary artery dissection**

Coronary artery dissection results from a tear in the inner layer of the coronary artery, the tunica intima. This allows blood to penetrate and cause an intramural hematoma in the central layer, the tunica media, and restriction in the size of lumen.

**Inclusions:** spontaneous coronary artery dissection

**Exclusions:** Injury or harm arising from a procedure, not elsewhere classified (NE81)

Injury of blood vessels of thorax (NB30)

**BA83****Coronary artery fistula, acquired**

Abnormal communication between a coronary artery and a cardiac chamber or major vessels, acquired after coronary or heart surgery, coronary angioplasty, rupture or coronary artery aneurysm or injury to the heart.

**BA84****Chronic total occlusion of coronary artery**

A chronic total occlusion of coronary artery is defined as the complete obstruction of a coronary artery or coronary arteries, exhibiting a TIMI flow score of zero or one, with an occlusion duration of greater than 3 months.

**Coding Note:**

Code also the causing condition

**Exclusions:** Acute myocardial infarction (BA41)

**BA85****Coronary vasospastic disease**

The term coronary vasospastic disease refers to a sudden, intense vasoconstriction of an epicardial coronary artery that causes vessel occlusion or near occlusion. Although it may be involved in other coronary syndromes, it represents the usual cause of variant angina.

**BA85.0****Silent coronary vasospastic disease**

The feature of this is the frequency of asymptomatic ischemic episodes in coronary vasospastic disease.

**BA85.Y****Other specified coronary vasospastic disease****BA85.Z****Coronary vasospastic disease, unspecified****BA86****Coronary microvascular disease****BA8Y****Other specified diseases of coronary artery****BA8Z****Diseases of coronary artery, unspecified**

Pulmonary heart disease or diseases of pulmonary circulation (BB00-BB0Z)

**BB00****Pulmonary thromboembolism**

**Exclusions:** Complications following abortion, ectopic or molar pregnancy (JA05)

Diseases of the circulatory system complicating pregnancy, childbirth or the puerperium (JB64.4)

<b>BB00.0</b>	<b>Acute pulmonary thromboembolism</b> Acute pulmonary thromboembolism is defined as a partial or complete occlusion of a pulmonary arterial branch with the abrupt onset of related symptoms, such as dyspnoea, tachypnoea, chest pain, cough and blood-tinged sputum. However, acute pulmonary embolism may also occur in the absence of any symptoms.
<b>BB00.1</b>	<b>Chronic pulmonary thromboembolism</b> Chronic pulmonary thromboembolism is defined as a partial or complete occlusion of at least one major pulmonary arterial branch in the presence of a mean pulmonary artery pressure 25mmHg at rest, and normal left ventricular filling pressures, despite effective coagulation over at least three months.
	<b>Coded Elsewhere:</b> Chronic thromboembolic pulmonary hypertension (BB01.3)
<b>BB00.Z</b>	<b>Pulmonary thromboembolism, unspecified</b>
<b>BB01</b>	<p><b>Pulmonary hypertension</b></p> <p>Pulmonary hypertension (PH) is a haemodynamic and pathophysiological condition defined as an increase in mean pulmonary arterial pressure (PAP) 25 mmHg at rest as assessed by right heart catheterization. PH can be found in multiple clinical conditions.</p> <p><b>Coded Elsewhere:</b> Persistent pulmonary hypertension of the newborn (KB42)</p>
<b>BB01.0</b>	<p><b>Pulmonary arterial hypertension</b></p> <p>Pulmonary arterial hypertension is a clinical condition characterised by the presence of pre-capillary pulmonary hypertension in the absence of other causes of pre-capillary pulmonary hypertension, such as due to lung diseases, chronic thromboembolic pulmonary hypertension, or other rare diseases. It includes different forms that share a similar clinical picture and virtually identical pathological changes of the lung microcirculation.</p> <p><b>Inclusions:</b> primary pulmonary hypertension</p>
<b>BB01.1</b>	<b>Pulmonary hypertension due to left heart disease</b>
<b>BB01.2</b>	<b>Pulmonary hypertension due to lung disease or hypoxia</b>
<b>BB01.3</b>	<p><b>Chronic thromboembolic pulmonary hypertension</b></p> <p>Chronic thromboembolic pulmonary hypertension (CTEPH) is characterised by the persistence of thromboemboli in the form of organised tissue obstructing the pulmonary arteries. The consequence is an increase in pulmonary vascular resistance (PVR) resulting in pulmonary hypertension (PH) and progressive right heart failure.</p>
<b>BB01.4</b>	<b>Pulmonary hypertension with multifactorial mechanism</b>
<b>Coding Note:</b>	Code also the causing condition
<b>BB01.5</b>	<p><b>Cor pulmonale</b></p> <p>Cor pulmonale refers to the altered structure and/or impaired function of the right ventricle that results from pulmonary hypertension associated with diseases of the lung, upper airway, or chest wall.</p> <p><b>Coding Note:</b> Code also the causing condition</p>

- BB01.Z** **Pulmonary hypertension, unspecified**
- BB02** **Certain specified diseases of pulmonary vessels**  
This definition includes Arteriovenous fistula of pulmonary vessels, Aneurysm of pulmonary artery and Other specified diseases of pulmonary vessels.
- BB02.0** **Arteriovenous fistula of pulmonary vessels**
- BB02.1** **Aneurysm of pulmonary artery**  
Aneurysm of pulmonary artery is an abnormal dilatation of part of the pulmonary artery
- BB02.10** Aneurysm of pulmonary artery with perforation
- BB02.11** Aneurysm of pulmonary artery with rupture
- BB02.12** Aneurysm of pulmonary artery without mention of perforation or rupture
- BB02.1Y** Other specified aneurysm of pulmonary artery
- BB02.1Z** Aneurysm of pulmonary artery, unspecified
- BB02.2** **Rupture of pulmonary vessels**  
This is defined as the tearing apart of the pulmonary vessels allowing blood to escape outside.
- BB02.3** **Acquired pulmonary arterial tree abnormality**  
A postnatal pathological change in form or function of the pulmonary arterial tree.  
**Coded Elsewhere:** Postprocedural pulmonary trunk stenosis (BE15.0)  
Postprocedural right pulmonary artery stenosis (BE15.1)  
Postprocedural pulmonary arterial tree disorder (BE15)
- BB03** **Acquired pulmonary venous abnormality**  
A postnatal pathological change in form or function of one or more pulmonary veins.  
**Coded Elsewhere:** Postprocedural pulmonary venous disorder (BE16)
- BB03.0** **Acquired pulmonary venous obstruction**  
A postnatal pathologic condition of one or more pulmonary vein(s) in which flow is impeded or blocked due to narrowing or atresia.
- BB03.Y** Other specified acquired pulmonary venous abnormality
- BB03.Z** Acquired pulmonary venous abnormality, unspecified
- BB0Y** Other specified pulmonary heart disease or diseases of pulmonary circulation
- BB0Z** Pulmonary heart disease or diseases of pulmonary circulation, unspecified

## Pericarditis (BB20-BB2Z)

**Coded Elsewhere:** Pneumopericardium originating in the perinatal period (KB27.3)

Acute rheumatic pericarditis (1B41.0)

**BB20**

### Acute pericarditis

Acute pericarditis is defined as pericardial inflammation of no more than 1 to 2 weeks duration.

**Coding Note:** Code also the causing condition

**Inclusions:** acute pericardial effusion

**Exclusions:** Acute rheumatic pericarditis (1B41.0)

**BB20.0**

### Infectious pericarditis

A disease of the pericardium, caused by a secondary infection with a bacterial, viral, or fungal source. This disease is characterised by fever, odynophagia, cough, fatigue, or chest pain. Confirmation is by identification of the bacterial, viral, or fungal agent in a blood sample.

**Coding Note:** Code also the causing condition

**Inclusions:** Pyopericarditis

**BB20.1**

### Neoplastic pericarditis

**Coding Note:** Code also the causing condition

**BB20.2**

### Myopericarditis

**Inclusions:** Perimyocarditis

**BB20.Y**

### Other specified acute pericarditis

**Coding Note:** Code also the causing condition

**BB20.Z**

### Acute pericarditis, unspecified

**Coding Note:** Code also the causing condition

**BB21**

### Chronic rheumatic pericarditis

Inflammation of the pericardium and of the surrounding mediastinal cellular tissue resulted from rheumatic etiology.

**BB22**

### Constrictive pericarditis

Chronic fibrous pericarditis due to the presence of dense fibrous tissue between the parietal and visceral layers of pericardium and neighbouring structures.

**Inclusions:** concretio cordis

**BB23**

### Cardiac tamponade

Cardiac tamponade is a clinical syndrome caused by the accumulation of fluid in the pericardial space, resulting in reduced ventricular filling and subsequent hemodynamic compromise. Cardiac tamponade is a medical emergency, the complications of which include shock, and death.

**BB24****Haemopericardium**

This is hemopericardium caused by diseases not elsewhere classified. Hemopericardium generally refers to blood in the pericardial sac of the heart. It is clinically similar to a pericardial effusion, and, depending on the volume and rapidity with which it develops, may cause cardiac tamponade.

**BB25****Pericardial effusion**

Pericardial effusion is an abnormal accumulation of fluid in the pericardial sac. Noninflammatory diseases such as chronic renal failure, circulatory congestion, hypothyroidism and amyloidosis can cause pericardial effusion.

**BB2Y****Other specified pericarditis**

**Coding Note:** Code also the causing condition

**BB2Z****Pericarditis, unspecified**

**Coding Note:** Code also the causing condition

**Acute or subacute endocarditis (BB40-BB4Z)**

A condition characterised by inflammation of endocardium

**Coded Elsewhere:** Acute rheumatic endocarditis (1B41.1)

Systemic lupus erythematosus with cardiac involvement (4A40.0Y)

Typhoid fever with heart involvement (1A07.Y)

**BB40****Acute or subacute infectious endocarditis**

**Coding Note:** Code also the causing condition

**Exclusions:** Infectious myocarditis (BC42.1)

**Coded Elsewhere:** Endocardial fibroelastosis (BC43.3)

Syphilitic endocarditis (1A62.1)

Tuberculosis of endocardium (1B12.0)

**BB41****Myoendocarditis**

**Exclusions:** Infectious myocarditis (BC42.1)

**BB42****Periendocarditis****BB4Y****Other specified acute or subacute endocarditis**

**Coding Note:** Code also the causing condition

**BB4Z****Acute or subacute endocarditis, unspecified**

**Coding Note:** Code also the causing condition

## Heart valve diseases (BB60-BC0Z)

- Exclusions:**
- Congenital anomaly of a ventriculo-arterial valve or adjacent regions (LA8A)
  - Atypical truncal valve (LA85.4)
  - Acute rheumatic fever (1B40-1B42)
  - Structural developmental anomalies of the circulatory system (LA80-LA9Z)

### Mitral valve disease (BB60-BB6Z)

This is a disorder of the heart in which the mitral valve does not close properly when the heart pumps out blood. It is the abnormal leaking of blood from the left ventricle through the mitral valve into the left atrium when the left ventricle contracts. Simply put, there is regurgitation of blood back into the left atrium.

- Exclusions:** Congenital anomaly of mitral valve (LA87.1)

- Coded Elsewhere:** Injury to mitral valve (NB31.40)

**BB60**

#### Mitral valve stenosis

- Exclusions:** Mitral valve stenosis with insufficiency (BB63)

- Coded Elsewhere:** Postprocedural mitral valve stenosis (BE12.0)

**BB60.0**

#### Rheumatic mitral valve stenosis

Mitral stenosis refers to narrowing of the mitral valve orifice, resulting in impedance of filling of the left ventricle in diastole. It is usually caused by rheumatic heart disease.

**BB60.1**

#### Nonrheumatic mitral valve stenosis

Mitral stenosis is narrowing of the passage through the mitral valve due to fibrosis, and calcinosis in the leaflets and chordal areas.

The most common reason of mitral stenosis is rheumatic fever. Except rheumatic fever; SLE, Malignant Sarcoid, Active Infective Endocarditis, Gout Whipple's Disease, Massive Annular calcification cause to the mitral stenosis.

- Exclusions:** Postprocedural mitral valve stenosis (BE12.0)

**BB60.Z**

#### Mitral valve stenosis, unspecified

**BB61**

#### Mitral valve insufficiency

Mitral insufficiency is a clinical condition which mitral valve can't close properly. It is the antidiromic leaking of blood from the left ventricle through the mitral valve, and into the left atrium.

- Exclusions:** Mitral valve stenosis with insufficiency (BB63)

- Coded Elsewhere:** Postprocedural mitral valve insufficiency (BE12.1)

Mitral valve insufficiency due to acute myocardial infarction (BA60.6)

- BB61.0** **Rheumatic mitral valve insufficiency**  
Mitral insufficiency can be caused by conditions such as rheumatic fever.  
Mitral insufficiency is leakage of blood from the left ventricle into the left atrium during systole.  
**Exclusions:** Active or acute endocarditis of mitral valve (1B41.1)
- BB61.Y** **Other specified mitral valve insufficiency**
- BB61.Z** **Mitral valve insufficiency, unspecified**
- BB62** **Mitral valve prolapse**  
**Inclusions:** floppy mitral valve syndrome  
**Exclusions:** Marfan syndrome (LD28.01)
- BB62.0** **Rheumatic mitral valve prolapse**  
This is a rheumatic valvular heart disease characterised by the displacement of an abnormally thickened mitral valve leaflet into the left atrium during systole.
- BB62.1** **Degenerative mitral valve prolapse**  
This is a degenerative valvular heart disease characterised by the displacement of an abnormally thickened mitral valve leaflet into the left atrium during systole.
- BB62.Y** **Other specified nonrheumatic mitral valve prolapse**
- BB62.Z** **Mitral valve prolapse, unspecified**
- BB63** **Mitral valve stenosis with insufficiency**  
This is a valvular heart disease characterised by the narrowing of the orifice of the mitral valve of the heart, with regurgitation.
- BB63.0** **Rheumatic mitral stenosis with insufficiency**  
Mitral stenosis and mitral insufficiency occur in patients with rheumatic heart disease.
- BB63.1** **Nonrheumatic mitral stenosis with insufficiency**  
This is a non-rheumatic valvular heart disease characterised by the narrowing of the orifice of the mitral valve of the heart, with regurgitation.
- BB63.Z** **Mitral valve stenosis with insufficiency, unspecified**
- BB64** **Mitral valvar abscess**
- BB65** **Mitral valve rupture**  
**Exclusions:** Rupture of papillary muscle or chordae tendineae as current complication following acute myocardial infarction (BA60.6)
- BB6Y** **Other specified mitral valve disease**
- BB6Z** **Mitral valve disease, unspecified**

Aortic valve disease (BB70-BB7Z)

**Exclusions:** Congenital anomaly of aortic valve (LA8A.2)

**Coded Elsewhere:** Traumatic injury to aortic valve (NB31.4Y)

Dysplasia of aortic valve (LA8A.2Y)

**BB70**

### **Aortic valve stenosis**

Aortic valve stenosis is abnormal narrowing of the aortic valve. This decreases the blood flow from heart to organs.

**Exclusions:** Congenital supravalvar aortic stenosis (LA8A.3)

Congenital subaortic stenosis (LA8A.5)

**Coded Elsewhere:** Postprocedural aortic valve stenosis (BE12.2)

**BB70.0**

### **Rheumatic aortic valve stenosis**

Aortic stenosis caused by scarring of the aortic valve due to rheumatic fever as a child or young adult. In aortic stenosis, the aortic valve does not open fully. This decreases blood flow from the heart.

**BB70.1**

### **Nonrheumatic aortic valve stenosis**

**Exclusions:** Postprocedural aortic valve stenosis (BE12.2)

**Coded Elsewhere:** Stenosis of the neoaortic valve of pulmonary origin (BC02.30)

**BB70.Y**

### **Other specified aortic valve stenosis**

**BB70.Z**

### **Aortic valve stenosis, unspecified**

**BB71**

### **Aortic valve insufficiency**

Aortic valve insufficiency results from leakage and backflow of blood that is ejected from the left ventricle into the ascending aorta back into the left ventricle.

**Coding Note:**

Code also the causing condition

**Coded Elsewhere:** Postprocedural aortic valve insufficiency (BE12.3)

Insufficiency of the neoaortic valve of pulmonary origin  
(BC02.31)

**BB71.0**

### **Rheumatic aortic valve insufficiency**

Aortic insufficiency is the leaking of the aortic valve of the heart that causes blood to flow in the reverse direction during ventricular diastole, from the aorta into the left ventricle. Rheumatic fever causes the valve cusps to retract.

**Inclusions:** rheumatic aortic incompetence

rheumatic aortic regurgitation

**Exclusions:** Active or acute rheumatic endocarditis of aortic valve (1B41.1)

**BB71.Y**

### **Other specified nonrheumatic aortic valve insufficiency**

**Coding Note:**

Code also the causing condition

**BB71.Z**

### **Aortic valve insufficiency, unspecified**

**Coding Note:**

Code also the causing condition

<b>BB72</b>	<b>Aortic valve stenosis with insufficiency</b>
<b>BB72.0</b>	<b>Rheumatic aortic stenosis with insufficiency</b> Aortic stenosis from chronic rheumatic heart disease is typically associated with aortic insufficiency. The valve commissures and cusps become adherent and fused, and the valve orifice becomes small. Upon auscultation, S2 may be single because the aortic leaflets are immobile and do not produce an aortic closure sound
<b>BB72.1</b>	<b>Nonrheumatic aortic valve stenosis with insufficiency</b> This is a non-rheumatic disease of the heart valves in which the opening of the aortic valve is narrowed, with regurgitation.
<b>BB72.Z</b>	<b>Aortic valve stenosis with insufficiency, unspecified</b>
<b>BB73</b>	<b>Aortic valvar abscess</b>
<b>BB74</b>	<b>Aortic valvar prolapse</b> A congenital cardiovascular malformation of the aortic valve in which part or all of one or more of the aortic valve leaflets is on the ventricular side of the plane of the inferior aspect of the attachments of the aortic valve leaflets.
<b>BB7Y</b>	<b>Other specified aortic valve disease</b>
<b>BB7Z</b>	<b>Aortic valve disease, unspecified</b>

Tricuspid valve disease (BB80-BB8Z)

**Exclusions:** Congenital anomaly of tricuspid valve (LA87.0)

**Coded Elsewhere:** Traumatic injury to tricuspid valve (NB31.4Y)

<b>BB80</b>	<b>Tricuspid valve stenosis</b> This is a valvular heart disease which results in the narrowing of the orifice of the tricuspid valve of the heart. It is a relatively rare condition that causes stenosis-increased resistance to blood flow through the valve.  <b>Coded Elsewhere:</b> Postprocedural tricuspid valve stenosis (BE12.4)
<b>BB80.0</b>	<b>Rheumatic tricuspid valve stenosis</b> Tricuspid stenosis is almost always rheumatic in origin. Tricuspid stenosis results in the narrowing of the orifice of the tricuspid valve of the heart.
<b>BB80.Y</b>	<b>Other specified nonrheumatic tricuspid valve stenosis</b>
<b>BB80.Z</b>	<b>Tricuspid valve stenosis, unspecified</b>
<b>BB81</b>	<b>Tricuspid valve insufficiency</b> This refers to the failure of the heart's tricuspid valve to close properly during systole. As a result, with each heart beat some blood passes from the right ventricle to the right atrium, the opposite of the normal direction.  <b>Coded Elsewhere:</b> Postprocedural tricuspid valve insufficiency (BE12.5)
<b>BB81.0</b>	<b>Rheumatic tricuspid valve insufficiency</b>

<b>BB81.Y</b>	<b>Other specified nonrheumatic tricuspid valve insufficiency</b>
<b>BB81.Z</b>	<b>Tricuspid valve insufficiency, unspecified</b>
<b>BB82</b>	<b>Tricuspid valve stenosis with insufficiency</b> This is a valvular heart disease which results in the narrowing of the orifice of the tricuspid valve of the heart. It is a relatively rare condition that causes stenosis-increased resistance to blood flow through the valve, with regurgitation.
<b>BB82.0</b>	<b>Rheumatic tricuspid valve stenosis with insufficiency</b> Tricuspid valve insufficiency due to leaflet abnormalities may be secondary to rheumatic heart disease. When due to the latter, it generally occurs in combination with tricuspid stenosis
<b>BB82.Y</b>	<b>Other specified nonrheumatic tricuspid valve stenosis with insufficiency</b>
<b>BB82.Z</b>	<b>Tricuspid valve stenosis with insufficiency, unspecified</b>
<b>BB83</b>	<b>Tricuspid valvular abscess</b>
<b>BB84</b>	<b>Tricuspid valve rupture</b>
<b>BB8Y</b>	<b>Other specified tricuspid valve disease</b>
<b>BB8Z</b>	<b>Tricuspid valve disease, unspecified</b>

Pulmonary valve disease (BB90-BB9Z)

**Exclusions:** Congenital anomaly of pulmonary valve (LA8A.0)

**Coded Elsewhere:** Traumatic injury to pulmonary valve (NB31.4Y)

<b>BB90</b>	<b>Pulmonary valve stenosis</b> Pulmonary valve stenosis is an obstruction at the level of pulmonary valve which impedes the outflow of blood from right ventricle to pulmonary artery. <b>Coded Elsewhere:</b> Postprocedural pulmonary valve stenosis (BE12.6)
<b>BB90.0</b>	<b>Rheumatic pulmonary valve stenosis</b> This is a rheumatic heart valve disorder in which outflow of blood from the right ventricle of the heart is obstructed at the level of the pulmonic valve.
<b>BB90.Y</b>	<b>Other specified nonrheumatic pulmonary valve stenosis</b>
<b>BB90.Z</b>	<b>Pulmonary valve stenosis, unspecified</b>
<b>BB91</b>	<b>Pulmonary valve insufficiency</b> Pulmonary valve insufficiency which is an incomplete closure of the pulmonary valve allows blood to return from pulmonary artery into the right ventricle. <b>Coded Elsewhere:</b> Postprocedural pulmonary valve insufficiency (BE12.7) Neopulmonary valve regurgitation (BE14.41)

- BB91.0** **Rheumatic pulmonary valve insufficiency**  
This is a rheumatic condition where the pulmonary valve is not strong enough to prevent backflow to the right ventricle.
- BB91.Y** **Other specified nonrheumatic pulmonary valve insufficiency**
- BB91.Z** **Pulmonary valve insufficiency, unspecified**
- BB92** **Pulmonary valve stenosis with insufficiency**  
This is a clinical condition in which pulmonary valve stenosis and pulmonary insufficiency are seen together.
- BB92.0** **Rheumatic pulmonary valve stenosis with insufficiency**  
This is a rheumatic heart valve disorder in which outflow of blood from the right ventricle of the heart is obstructed at the level of the pulmonic valve, with regurgitation.
- BB92.1** **Nonrheumatic pulmonary valve stenosis with insufficiency**  
This is a non-rheumatic heart valve disorder in which outflow of blood from the right ventricle of the heart is obstructed at the level of the pulmonic valve, with regurgitation.
- BB92.Z** **Pulmonary valve stenosis with insufficiency, unspecified**
- BB93** **Pulmonary valvar abscess**
- BB9Y** **Other specified pulmonary valve disease**
- BB9Z** **Pulmonary valve disease, unspecified**
- BC00** **Multiple valve disease**
- Coding Note:** When specific type of valve disease is known, assign codes for the specific conditions.
- BC01** **Prosthetic valve disease**
- Coding Note:** When specific type of valve disease is known, assign codes for the specific conditions.
- Coded Elsewhere:** Infection or inflammatory reaction of heart valve prosthesis NOS (NE83.1)

**BC02****Acquired abnormality of congenitally malformed valve**

A postnatal pathological change in form or function of a congenitally malformed valve.

- Exclusions:**
- Congenital anomaly of aortic valve (LA8A.2)
  - Congenital anomaly of mitral valve (LA87.1)
  - Congenital anomaly of pulmonary valve (LA8A.0)
  - Congenital anomaly of tricuspid valve (LA87.0)
- Coded Elsewhere:**
- Endocarditis of common atrioventricular valve (BB40)
  - Endocarditis of right atrioventricular valve (BB40)
  - Endocarditis of left atrioventricular valve (BB40)
  - Endocarditis of the neoaortic valve of pulmonary origin (BB40)
  - Endocarditis of neopulmonary valve (BB40)

**BC02.0****Acquired common atrioventricular valvar abnormality in biventricular connections**

A postnatal pathological change in form or function of the common atrioventricular valve in the presence of biventricular atrioventricular connections.

**BC02.1****Acquired truncal valvar abnormality**

A postnatal pathological change in form or function of the truncal valve when the truncal valve supplies both the systemic and pulmonary circulations.

- Coded Elsewhere:** Endocarditis of truncal valve or neo-aortic valve of truncal origin (BB40)

**BC02.2****Acquired common atrioventricular valvar abnormality in double inlet ventricle**

**Coded Elsewhere:** Postprocedural common atrioventricular valvar abnormality in double-inlet ventricle (BE14.7)

- Postprocedural right-sided atrioventricular valvar abnormality in double-inlet ventricle (BE14.5)
- Postprocedural left-sided atrioventricular valvar abnormality in double-inlet ventricle (BE14.6)

**BC02.3****Acquired abnormality of neoaortic valve of pulmonary origin****BC02.30**

Stenosis of the neoaortic valve of pulmonary origin

Acquired obstruction to flow through the neo-aortic valve of pulmonary origin, that is, the native pulmonary valve that has become the functional neo-aortic valve.

Examples of hearts in which a neo-aortic valve has been created include the aortopulmonary anastomosis (Damus-Kaye-Stansel, Norwood procedures), pulmonary valve autograft (Ross procedure), and arterial switch operation

**BC02.31**

Insufficiency of the neoaortic valve of pulmonary origin

Acquired backward flow through the neo-aortic valve of pulmonary origin, that is, the native pulmonary valve that has become the functional neo-aortic valve.

Examples of hearts in which a neo-aortic valve has been created include the aortopulmonary anastomosis (Damus-Kaye-Stansel, Norwood procedures), pulmonary valve autograft (Ross procedure), and arterial switch operation.

<b>BC02.3Y</b>	Other specified acquired abnormality of neoaortic valve of pulmonary origin
<b>BC02.3Z</b>	Acquired abnormality of neoaortic valve of pulmonary origin, unspecified
<b>BC02.4</b>	<b>Acquired abnormality of the neoaortic valve of truncal origin</b> A postnatal pathological change in form or function of the neo-aortic valve that results from biventricular repair of common arterial trunk (truncus arteriosus)
<b>BC02.40</b>	Acquired stenosis of the neoaortic valve of truncal origin Acquired obstruction to flow through the neo-aortic valve, when the neo-aortic valve results from biventricular repair of common arterial trunk (truncus arteriosus)
<b>BC02.41</b>	Acquired regurgitation of the neoaortic valve of truncal origin Acquired backward flow through the neo-aortic valve, when the neo-aortic valve results from biventricular repair of common arterial trunk (truncus arteriosus)
<b>BC02.4Y</b>	Other specified acquired abnormality of the neoaortic valve of truncal origin
<b>BC02.4Z</b>	Acquired abnormality of the neoaortic valve of truncal origin, unspecified

<b>BC20.1</b>	<b>Rheumatic heart disease, unspecified</b>
<b>BC20.Y</b>	<b>Other specified chronic rheumatic heart disease</b>

**BC20.Z                   Chronic rheumatic heart disease, unspecified**

**Diseases of the myocardium or cardiac chambers (BC40-BC4Z)**

This refers to diseases of a type of involuntary striated muscle found in the walls and histological foundation of the heart, with specific reference to the atrial and ventricular chambers, as well as the myocardium itself.

**BC40                   Acquired atrial abnormality**

A postnatal pathological change in form or function of one or both atriums.

**Coded Elsewhere:** Postprocedural residual or recurrent interatrial communication (BE17)

Postprocedural right atrial complication (BE1E)

Postprocedural left atrial complication (BE1F)

**BC40.0                   Acquired interatrial communication**

A postnatal pathological hole or pathway between the atrial chambers.

**BC40.Y                   Other specified acquired atrial abnormality**

**BC40.Z                   Acquired atrial abnormality, unspecified**

**BC41                   Acquired ventricular abnormality**

A postnatal pathological change in form or function of a ventricle.

**Coded Elsewhere:** Postprocedural ventricular septal defect disorder (BE14.8)

**BC41.0                   Acquired interventricular communication**

Hole or pathway between the ventricular chambers not present at birth.

**Coded Elsewhere:** Ventricular septal defect as current complication following acute myocardial infarction (BA60.3)

**BC41.Y                   Other specified acquired ventricular abnormality**

**BC41.Z                   Acquired ventricular abnormality, unspecified**

**BC42                   Myocarditis**

Myocarditis (inflammatory cardiomyopathy) is inflammation of the heart muscle generally in the presence of a dilated cardiomyopathy that results from exposure to either discrete infectious external antigens such as viruses, bacteria, fungal or parasites; non-infectious external antigens such as hypersensitivity to drugs; or internal non-infectious triggers such as autoimmune or hypersensitive activation against self-antigens.

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Acute rheumatic myocarditis (1B41.2)

Sarcoid myocarditis (4B20.Y)

Loeffler endocarditis (BC43.20)

<b>BC42.0</b>	<b>Giant cell myocarditis</b>
	Giant cell myocarditis is a form of dilated cardiomyopathy secondary to myocardial inflammation that is characterised by widespread infiltration of giant cells (abnormal masses produced by the fusion of macrophages) associated with other inflammatory cells and heart muscle cell destruction.
<b>BC42.1</b>	<b>Infectious myocarditis</b>
	Infectious myocarditis (infectious inflammatory cardiomyopathy) is inflammation of the heart muscle generally in the presence of a dilated cardiomyopathy that results from exposure to discrete infectious external antigens such as a virus, bacteria or parasite.
<b>Coding Note:</b>	Code also the causing condition
	<b>Exclusions:</b>
	Acute rheumatic myocarditis (1B41.2)
	Myoendocarditis (BB41)
	Acute or subacute infectious endocarditis (BB40)
<b>BC42.2</b>	<b>Hypersensitivity myocarditis</b>
	Hypersensitivity myocarditis is the presence of dilated cardiomyopathy in association with a known related disorder (hypereosinophilic syndrome (usually a restrictive cardiomyopathy), Churg-Strauss syndrome, malignancy, parasite infection, drugs, or vaccines) and findings of interstitial lymphocytic and eosinophilic infiltration, giant cell, and possible myocardial necrosis on biopsy, usually with peripheral eosinophilia.
	<b>Inclusions:</b>
	eosinophilic myocarditis
<b>BC42.3</b>	<b>Rheumatic myocarditis</b>
	Rheumatic myocarditis is cardiac inflammation and scarring triggered by an autoimmune reaction to group A streptococci infection resulting acutely in pancarditis involving inflammation of the myocardium, endocardium, and epicardium and chronically by valve fibrosis.
<b>Coding Note:</b>	Code also the causing condition
<b>BC42.Y</b>	<b>Other specific myocarditis</b>
<b>Coding Note:</b>	Code also the causing condition
<b>BC42.Z</b>	<b>Myocarditis, unspecified</b>
<b>Coding Note:</b>	Code also the causing condition

**BC43**

### **Cardiomyopathy**

These are myocardial disorders in which the heart muscle is structurally and functionally abnormal, in the absence of coronary artery disease, hypertension, valvular disease and congenital heart disease sufficient to cause the observed myocardial abnormality.

**Coding Note:** Code also the causing condition

**Exclusions:** Inflammatory cardiomyopathy (BC42)

Myocarditis (BC42)

**Coded Elsewhere:** Ischaemic cardiomyopathy (BA51)

Pacing-induced cardiomyopathy (NE82.03)

Cardiomyopathy in the puerperium (JB44.3)

**BC43.0**

### **Dilated cardiomyopathy**

Dilated cardiomyopathy is a myocardial disorder in which there is systolic dysfunction and chamber dilation of one or both ventricles in the absence of a haemodynamic cause that can produce the existent dilation and dysfunction, including physiological (such as sepsis) or anatomic causes with either abnormal loading conditions (such as coarctation of the aorta) or ischaemia (such as coronary artery disease or anomalies).

Additional information: Physiological and anatomic conditions can affect the dilated cardiomyopathy morphofunctional phenotype. If this morphofunctional phenotype is retained after appropriate intervention, then a dilated cardiomyopathy is established.

**Inclusions:** Congestive cardiomyopathy

**BC43.00**

Familial-genetic dilated cardiomyopathy

Familial-genetic dilated cardiomyopathy is the presence of dilated cardiomyopathy that is present in multiple members of a pedigree, or in the presence of a genetic mutation known to be significantly associated with dilated cardiomyopathy.

Additional information: Candidate cytoskeletal and Z disk-encoding genes, most of whom are hypothesized to lead to abnormalities in force transmission, include  $\delta$ -sarcoglycan,  $\beta$ -sarcoglycan, desmin, lamin A/C, metavinculin, muscle LIM protein, titin,  $\alpha$ -actinin-2, nebulin, myopalladin, and ZASP (Z band alternatively spliced PDZ domain protein)

**Coded Elsewhere:** Dilated cardiomyopathy due to glycogen branching enzyme deficiency (5C51.3)

**BC43.01**

Nonfamilial dilated cardiomyopathy

Nonfamilial dilated cardiomyopathy is dilated cardiomyopathy secondary to an acquired systemic disorder that is known to be associated with dilated or inflammatory cardiomyopathy such as infectious myocarditis, exposure to toxins such as alcohol or anthracycline therapy, nutritional disorders, autoimmune disease, and many others.

**Exclusions:** Pacing-induced cardiomyopathy (NE82.03)

**BC43.0Z**

Dilated cardiomyopathy, unspecified

<b>BC43.1</b>	<b>Hypertrophic cardiomyopathy</b> Hypertrophic cardiomyopathy is the presence of a hypertrophied, non-dilated ventricle in the absence of a hemodynamic cause that is capable of producing the existent magnitude of wall thickening excluding both physiologic hypertrophy secondary to physical activity, and pathologic hypertrophy due to systemic hypertension, aortic valvar stenosis, and coarctation.
	<b>Coded Elsewhere:</b> Syndrome of infant of a diabetic mother, type 1 or 2, nongestational, insulin dependent (KB60.1)
<b>BC43.10</b>	Familial-genetic hypertrophic cardiomyopathy Familial isolated hypertrophic cardiomyopathy is the presence of non-syndromic hypertrophic cardiomyopathy in multiple members of a pedigree, or in the presence of a genetic mutation known to be significantly associated with hypertrophic cardiomyopathy.
<b>BC43.11</b>	Non-obstructive hypertrophic cardiomyopathy Non-obstructive hypertrophic cardiomyopathy is hypertrophic cardiomyopathy that has no fixed or dynamic intraventricular narrowing sufficient to result in a significant pressure gradient between the ventricular apex and the outflow valve (aortic or pulmonary).
<b>BC43.12</b>	Obstructive hypertrophic cardiomyopathy Obstructive hypertrophic cardiomyopathy is hypertrophic cardiomyopathy that manifests sufficient fixed or dynamic narrowing within one or both ventricles to result in a significant pressure gradient between the ventricular apex and the outflow valve (aortic or pulmonary).
<b>BC43.1Y</b>	Other specified hypertrophic cardiomyopathy
<b>BC43.1Z</b>	Hypertrophic cardiomyopathy, unspecified
<b>BC43.2</b>	<b>Restrictive cardiomyopathy</b> Restrictive cardiomyopathy is the presence of impaired ventricular diastolic function related to reduced rate and/or extent of relaxation and/or compliance in the absence of another predominant phenotype of dilated or hypertrophic cardiomyopathy.
<b>BC43.20</b>	Nonfamilial restrictive cardiomyopathy Nonfamilial restrictive cardiomyopathy is restrictive cardiomyopathy secondary to an acquired systemic disorder that is known to be associated with restrictive cardiomyopathy such as amyloidosis, scleroderma, sarcoidosis, or anthracycline therapy.
<b>BC43.2Y</b>	Other specified restrictive cardiomyopathy
<b>BC43.2Z</b>	Restrictive cardiomyopathy, unspecified

- BC43.3 Endocardial fibroelastosis**  
Endocardial fibroelastosis is the formation of a marked fibro-elastic thickening of the subendocardium in one or both cardiac ventricles. A disorder of fetuses and infants, secondary causes include congenital left-sided obstructive cardiac lesions, metabolic disorders, autoimmune disease (anti-Ro/anti-La antibodies), and transplacental viral infection such as mumps. Primary endocardial fibroelastosis has been linked to recessive and x-linked inheritance, such as with Barth syndrome.
- BC43.4 Cardiomyopathy due to drugs or other external agents**  
This is one type of cardiomyopathy due to drugs and other external agents. Causing agents are alcohol, cocaine chemotherapeutic agents, psychotherapeutic agents and chemical toxins.
- BC43.5 Stress-induced cardiomyopathy**  
Stress-induced or Takotsubo cardiomyopathy is a disease of the myocardium characterised by episodes of acute onset, reversible left ventricular apical wall motion abnormalities mimicking acute myocardial infarction, but with non-specific electrocardiographic ST elevation and T wave changes, and minimal myocardial enzymatic release, in the absence of coronary stenosis.  
**Inclusions:**      Takotsubo cardiomyopathy
- BC43.6 Arrhythmogenic ventricular cardiomyopathy**  
Arrhythmogenic ventricular cardiomyopathy is a cardiomyopathy characterised by myocardial cell loss with partial or total replacement of right ventricular muscle by adipose and fibrous tissue, beginning subepicardially to become transmural in time, sparing the papillary muscles and trabeculae, and often associated with aneurysms particularly of the right ventricular outflow tract. There is progressive systolic impairment with ventricular dilation and marked propensity for ventricular arrhythmias of right, as well as left, ventricular origin. Classically a disease of the right ventricle, more recent evidence suggests left ventricular involvement to a varying extent in up to 75% of cases, as well as isolated left ventricular disease.
- BC43.7 Diabetic cardiomyopathy**  
Diabetic cardiomyopathy is the presence of myocardial dysfunction in the absence of overt clinical coronary artery disease, valvar disease, and other conventional cardiovascular risk factors, such as hypertension and dyslipidemia. It is initially characterised by myocardial fibrosis, dysfunctional remodeling, and diastolic dysfunction, progressing to systolic dysfunction and heart failure.  
Additional information. The development and progression of diabetic cardiomyopathy has been linked to impaired cardiac insulin metabolic signaling, increases in oxidative stress, reduced nitric oxide bioavailability, collagen-based cardiomyocyte and extracellular matrix stiffness, impaired mitochondrial and cardiomyocyte calcium handling, inflammation, renin–angiotensin–aldosterone system activation, cardiac autonomic neuropathy, endoplasmic reticulum stress, microvascular dysfunction, and a myriad of cardiac metabolic abnormalities.
- Coding Note:** Always assign an additional code for diabetes mellitus.
- BC43.Y Other specified cardiomyopathy**  
**Coding Note:** Code also the causing condition

**BC43.Z**      **Cardiomyopathy, unspecified**

**Coding Note:** Code also the causing condition

**BC44**      **Noncompaction cardiomyopathy**

Noncompaction cardiomyopathy is a morphologic abnormality of the myocardium predominantly affecting the apex of the ventricle characterised by hypertrabeculation and deep inter-trabecular recesses, usually accompanied by an abnormally thin subepicardial layer of compacted myocardium, that is generally but not always associated with ventricular dysfunction.

Additional information. Noncompaction cardiomyopathy classically involves the left ventricle but can also involve only the right ventricle or both. It can occur as an isolated finding or in association with a dilated, hypertrophic, or mixed cardiomyopathic phenotype. It has been described in association with complex congenital heart disease, coronary artery anomalies and as an isolated finding, with and without musculoskeletal and other system abnormalities.

**BC45**      **Cardiomegaly**

**BC46**      **Intracardiac thrombosis**

**Exclusions:**      Acute myocardial infarction, without specification of ST elevation (BA41)

**BC4Y**      **Other specified diseases of the myocardium or cardiac chambers**

**BC4Z**      **Diseases of the myocardium or cardiac chambers, unspecified**

**Cardiac arrhythmia (BC60-BC9Z)**

This is any of a large and heterogeneous group of conditions in which there is abnormal electrical activity in the heart. The heartbeat may be too fast or too slow, and may be regular or irregular.

**Coded Elsewhere:** Cardiac arrest (MC82)

Cardiac arrhythmias in the neonate (KB41)

Dysfunction or complication of pacemaker, pacemaker lead or implantable cardioverter defibrillator, not elsewhere classified (NE82)

**BC60**      **Atrial premature depolarization**

Cardiac electrical depolarization arising from the atria, occurring earlier than the expected sinus beat

**BC61**      **Junctional premature depolarization**

Cardiac electrical depolarization arising from the compact atrioventricular node or His bundle occurring earlier than the expected sinus beat.

**BC62**      **Accessory pathway**

An additional electrical connection which typically bypasses the AV node, typically inserting directly into atrial and ventricular myocardium, but may also connect to the specialised conduction system (e.g., the bundle of His, right or left bundles, or one of the fascicles).

<b>BC63</b>	<b>Conduction disorders</b> Any abnormal alteration of atrio-ventricular conduction. <b>Coded Elsewhere:</b> Congenital heart block (LA8Y)
<b>BC63.0</b>	<b>Atrioventricular block, first degree</b> Disorder of the atrioventricular conduction system in which the PR interval is greater than the 97th percentile for age or > 200 ms in adults
<b>BC63.1</b>	<b>Atrioventricular block, second degree</b> Disorder of the atrioventricular conduction system in which some but not all atrial impulses fail to propagate to the ventricles. Electrocardiographically, some P waves are not followed by a QRS complex.
<b>BC63.10</b>	High-grade second degree atrioventricular block Form of second degree atrioventricular block in which either multiple consecutive P-waves are not conducted or there are transient periods of atrioventricular dissociation
<b>BC63.1Y</b>	Other specified atrioventricular block, second degree
<b>BC63.1Z</b>	Atrioventricular block, second degree, unspecified
<b>BC63.2</b>	<b>Complete atrioventricular block</b> Disorder of the atrioventricular conduction system in which there is failure of all atrial impulses to propagate to the ventricle <b>Inclusions:</b> Third-degree block
<b>BC63.20</b>	Congenital complete atrioventricular block Third degree atrioventricular block is defined as the absence of atrioventricular node conduction and here it is congenital, that is, it has been present since birth and is not acquired, although it may be first detected later. <b>Exclusions:</b> Congenital complete heart block (LA80-LA8Z)
<b>BC63.21</b>	Acquired complete atrioventricular block Complete atrioventricular block in which the onset of the conduction disorder is recognised after birth
<b>BC63.2Z</b>	Complete atrioventricular block, unspecified
<b>BC63.3</b>	<b>Right bundle branch block</b> Disorder of the atrioventricular conduction system characterised by prolonged QRS duration (greater than or equal to 120 ms in adults, greater than 100 ms in children ages 4 to 16 years, and greater than 90 ms in children less than 4 years of age), rsr, rsR, or rSR in leads V1 or V2, S wave of greater duration than R wave (or greater than 40 ms in leads I and V6 in adults)

<b>BC63.4</b>	<b>Left bundle branch block</b> Disorder of the atrioventricular conduction system in which the QRS duration is greater than or equal to 120 ms in adults, greater than 100 ms in children 4 to 16 years of age, and greater than 90 ms in children less than 4 years of age; there is a QS or rS pattern in lead V1 and a wide slurred R wave in leads I and V6.
<b>BC63.40</b>	Left anterior fascicular block Disorder of the atrioventricular conduction system characterised by left axis deviation for age (frontal plane axis between -45° and -90°), qR pattern in lead aVL, R-peak time in lead aVL of 45 ms or more, and a QRS duration that does not meet age dependent criteria for complete bundle branch block (less than 120 ms in adults, less than 100 ms in children 4 to 16 years of age, and less than 90 ms in children less than 4 years of age)
<b>BC63.41</b>	Left posterior fascicular block Disorder of the atrioventricular conduction system characterised by right axis deviation for age (between 90° and 180° in adults), with a qR pattern in inferior leads, rS pattern in leftward leads (I and aVL), and a QRS duration that does not meet age dependent criteria for complete bundle branch block (less than 120 ms in adults, less than 100 ms in children 4 to 16 years of age, and less than 90 ms in children less than 4 years of age)
<b>BC63.4Z</b>	Left bundle branch block, fascicle unspecified
<b>BC63.5</b>	<b>Nonspecific intraventricular conduction delay</b> Disorder of the atrioventricular conduction system characterised by a prolonged QRS duration (QRS duration greater than 110 ms in adults, greater than 90 ms in children 8 to 16 years of age, and greater than 80 ms in children less than 8 years of age) without criteria for right or left bundle branch block.
<b>BC63.Y</b>	<b>Other specified conduction disorders</b>
<b>BC63.Z</b>	<b>Conduction disorders, unspecified</b>
<b>BC64</b>	<b>Sudden arrhythmic death syndrome</b>
<b>BC65</b>	<b>Cardiac arrhythmia associated with genetic disorder</b>
<b>BC65.0</b>	<b>Long QT syndrome</b> A congenital disorder of ventricular myocardial repolarization characterised by a prolonged QT interval on the electrocardiogram (ECG) that can lead to symptomatic ventricular arrhythmias and an increased risk of sudden cardiac death.
<b>BC65.1</b>	<b>Brugada syndrome</b> Clinical manifestations of cardiac syncope, ventricular tachycardia, ventricular fibrillation, or sudden death in conjunction with a genetic mutation associated with Brugada Syndrome and/or a Brugada pattern ECG (spontaneous or provoked).
<b>BC65.2</b>	<b>Short QT syndrome</b> Familial short QT syndrome is a rare cardiac rhythm disorder that associates a short QT interval (QT and QTc 300 ms) on the surface electrocardiogram (ECG) with a high risk of syncope or sudden death due to malignant ventricular arrhythmia.

- BC65.3 Early repolarisation syndrome**  
Genetic arrhythmia disorder characterised by inferolateral J wave elevation noted on ECG in conjunction with ventricular fibrillation not explained by other causes.
- BC65.4 Idiopathic ventricular fibrillation**  
Genetic arrhythmia disorder characterised by occurrence of ventricular fibrillation in the absence of other underlying causes, including absence of electrocardiogram (ECG) findings of Brugada syndrome, bidirectional ventricular tachycardia, and inferolateral J wave elevation.
- BC65.5 Catecholaminergic polymorphic ventricular tachycardia**  
Catecholaminergic polymorphic ventricular tachycardia (CPVT) is a severe genetic arrhythmogenic disorder of childhood characterised by adrenergically-induced ventricular tachycardia (bidirectional ventricular tachycardia and, less frequently, supraventricular tachycardia and atrial fibrillation) manifesting as syncope and sudden death.
- BC65.Y Other specified cardiac arrhythmia associated with genetic disorder**
- BC65.Z Cardiac arrhythmia associated with genetic disorder, unspecified**

Ventricular rhythm disturbance (BC70-BC7Z)

Any cardiac rhythm anomaly arising from the ventricles.

- BC70 Ventricular premature depolarization**  
Ventricular depolarization occurring earlier than the expected ventricular depolarization initiated by the sinoatrial node or another supraventricular pacemaker.
- BC71 Ventricular tachyarrhythmia**  
Any ventricular rhythm disturbance with a rate faster than the normal age dependent ventricular escape rate.
- BC71.0 Ventricular tachycardia**  
Ventricular tachycardia is a cardiac arrhythmia of three or more consecutive complexes in duration emanating from the ventricles at a rate of greater than 120 bpm in adolescents or adults and a rate greater than 150 bpm in child. Ventricular tachycardia may occur with or without loss of cardiac output.
- BC71.00 Right outflow tract ventricular tachycardia**  
Monomorphic ventricular tachycardia with focal activity originating from the right ventricular outflow tract, having a left bundle branch block (LBBB) morphology and inferior axis.
- BC71.01 Polymorphic ventricular tachycardia**  
Ventricular tachycardia with 2 or more QRS morphologies.

<b>BC71.02</b>	Sustained ventricular tachycardia Ventricular tachycardia that has a duration of >30 seconds or causes haemodynamic instability.
<b>BC71.03</b>	Non-sustained ventricular tachycardia Ventricular tachycardia lasting less than or equal to 30 seconds
<b>BC71.0Y</b>	Other specified ventricular tachycardia
<b>BC71.0Z</b>	Ventricular tachycardia, unspecified
<b>BC71.1</b>	<b>Ventricular fibrillation</b> Ventricular fibrillation is a rapid grossly irregular ventricular rhythm, usually more than 300 bpm/200 ms (cycle length 180 ms or less), with marked variability in QRS cycle length, morphology, and amplitude, associated with loss of cardiac output, and is usually sustained, requiring intervention to terminate.
<b>BC71.2</b>	<b>Re-entry ventricular arrhythmia</b>
<b>BC71.Y</b>	<b>Other specified ventricular tachyarrhythmia</b>
<b>BC71.Z</b>	<b>Ventricular tachyarrhythmia, unspecified</b>
<b>BC7Y</b>	<b>Other specified ventricular rhythm disturbance</b>
<b>BC7Z</b>	<b>Ventricular rhythm disturbance, unspecified</b>

Supraventricular rhythm disturbance (BC80-BC8Z)

<b>BC80</b>	<b>Supraventricular bradycardia</b> Any of a number of possible arrhythmias originating at or above the level of bundle of His in which the heart beats slower than the age-dependent lower limits of normal.
<b>BC80.0</b>	<b>Sinus pause</b> An interruption in the typical sinus cadence where the p-p interval > sum of 2 previous p-p (excludes sinus arrhythmia).
<b>BC80.1</b>	<b>Sinus bradycardia</b> Resting sinus rates below the 97% for age (<60 bpm in adults).
<b>BC80.2</b>	<b>Sinus node dysfunction</b> Non-specific term that refers to abnormalities in sinus node impulse formation and propagation and includes sinus bradycardia, sinus pause/arrest, chronotropic incompetence, and sinoatrial exit block.
<b>BC80.20</b>	Sick sinus syndrome Sick sinus syndrome may be defined as inappropriate sinus rates (either resting bradycardia or chronotropic incompetence) which may be associated with episodes of atrial tachycardia.

<b>BC80.21</b>	Sinoatrial block Delay or block of the electrical impulse from the sinus node to the atria
<b>BC80.2Y</b>	Other specified sinus node dysfunction
<b>BC80.2Z</b>	Sinus node dysfunction, unspecified
<b>BC80.Y</b>	<b>Other specified supraventricular bradyarrhythmia</b>
<b>BC80.Z</b>	<b>Supraventricular bradyarrhythmia, unspecified</b>
<b>BC81</b>	<b>Supraventricular tachyarrhythmia</b> Tachycardia originating at or above the atrioventricular (AV) node, usually with a narrow QRS or QRS complex similar to the sinus QRS morphology.
<b>BC81.0</b>	<b>Ectopic atrial tachycardia</b> Ectopic atrial tachycardia originates from a small area (focus) in the atrium and spreading centrifugally.
<b>BC81.1</b>	<b>Junctional ectopic tachycardia</b> Narrow or usual complex tachycardia originates from a focus at or near the atrioventricular junction.
<b>BC81.2</b>	<b>Macro reentrant atrial tachycardia</b> An atrial arrhythmia in which there is intra-atrial reentry or circus movement around a fixed or functional central obstacle. The central obstacle may consist of normal (e.g. valves) or abnormal (e.g. scar) structures.  This form of SVT originates in the atrium; conduction to the ventricles is not necessary for the tachycardia to continue. An organised atrial rhythm with a rate typically between 250 and 350 bpm, including tachycardias using a variety of reentry circuits that often occupy large areas of the atrium ("macro-reentrant"). Here the arrhythmia involves the cavotricuspid isthmus.
<b>BC81.20</b>	Cavotricuspid isthmus dependent macroreentry tachycardia A macro re-entrant atrial tachycardia that rotates around the tricuspid annulus.
<b>BC81.21</b>	Non-scar, non-isthmus dependent macro reentrant atrial tachycardia A macro re-entrant atrial tachycardia coursing around a normal cardiac structure (except the cavotricuspid isthmus) such as the mitral valve annulus, or superior caval vein.
<b>BC81.22</b>	Scar mediated macro reentrant atrial tachycardia A macro re-entrant atrial tachycardia in which the central obstacle and/or the zone of slow conduction sustaining the tachycardia is due to scar. In this context scar generally refers to surgical or ischaemic heart disease mediated scarring rather than the fibrosis that can accompany other disease states or aging.
<b>BC81.2Y</b>	Other specified macro reentrant atrial tachycardia
<b>BC81.2Z</b>	Macro reentrant atrial tachycardia, unspecified

- BC81.3** **Atrial fibrillation**  
An atrial tachyarrhythmia characterised by rapid (usually faster than 300 bpm), irregular and uncoordinated atrial impulse generation, usually manifesting on ECG with indistinct P-waves and an irregularly irregular ventricular response.
- BC81.30** **Paroxysmal atrial fibrillation**  
Recurrent AF (>=2 episodes) that terminates spontaneously within 7 days or less (usually within 24 hours).
- BC81.31** **Persistent atrial fibrillation**  
Atrial fibrillation (AF) which is sustained beyond seven days, or lasting less than seven days but necessitating pharmacologic or electrical cardioversion to restore normal sinus rhythm.
- BC81.32** **Permanent atrial fibrillation**  
A term used to identify individuals with persistent AF where a decision has been made to no longer pursue a rhythm control strategy, or where cardioversion has either failed or not been attempted.
- BC81.33** **Preexcited atrial fibrillation**  
Atrial fibrillation that occurs in the setting of a preexcitation syndrome such a Wolff-Parkinson-White syndrome, resulting in an erratic wide-complex rhythm that can degenerate into ventricular fibrillation, and sudden cardiac death.
- BC81.3Y** **Other specified atrial fibrillation**
- BC81.3Z** **Atrial fibrillation, unspecified**
- BC81.4** **Wolff-Parkinson-White syndrome**  
Arrhythmia symptoms, documented supraventricular tachycardia, and/or cardiac arrest due to rapidly conducted atrial fibrillation associated with preexcitation on electrocardiogram. Includes latent preexcitation identified during electrophysiology study.
- BC81.5** **Sinus node reentrant tachycardia**  
A reentrant tachycardia within the sinus node/perinodal tissue characterised by abrupt onset/termination, regular cadence, and P-waves consistent with sinus node origin
- BC81.6** **Inappropriate sinus tachycardia**  
Heart rate which is elevated with regard to level of activity; usually exhibits features of automaticity.
- BC81.7** **Atrioventricular reciprocating tachycardia**  
A macro-reentrant tachycardia involving the atria and ventricles in series that uses the atrioventricular node or an accessory pathway for one limb of the circuit and an accessory pathway for the other.

- BC81.70** Atrioventricular reciprocating tachycardia, orthodromic  
An atrioventricular reciprocating tachycardia that uses an accessory pathway for retrograde conduction and the atrioventricular node for anterograde conduction resulting in a narrow or usual complex tachycardia.
- BC81.71** Atrioventricular reciprocating tachycardia, antidromic  
An atrioventricular reciprocating tachycardia that uses the atrioventricular node for retrograde conduction and the accessory pathway for anterograde conduction resulting in a wide complex tachycardia.
- BC81.7Y** Other specified atrioventricular reciprocating tachycardia
- BC81.7Z** Atrioventricular reciprocating tachycardia, unspecified
- BC81.8** **Atrioventricular nodal reentry tachycardia**  
A reentrant supraventricular tachycardia that uses multiple slow atrioventricular nodal pathways or a slow atrioventricular nodal pathway in conjunction with a fast atrioventricular nodal pathway in a reentry circuit.
- BC81.Y** **Other specified supraventricular tachyarrhythmia**
- BC81.Z** **Supraventricular tachyarrhythmia, unspecified**
- BC8Y** **Other specified supraventricular rhythm disturbance**
- BC8Z** **Supraventricular rhythm disturbance, unspecified**
- BC90** **Rhythm disturbance at level of atrioventricular junction**
- BC91** **Pacemaker or implantable cardioverter defibrillator battery at end of battery life**  
Pacemaker or implantable cardioverter defibrillator (ICD) battery at or near complete exhaustion.
- BC9Y** **Other specified cardiac arrhythmia**
- BC9Z** **Cardiac arrhythmia, unspecified**

## Heart failure (BD10-BD1Z)

**Exclusions:** Heart failure following cardiac surgery or due to presence of cardiac prosthesis (BE11)  
complicating abortion or ectopic or molar pregnancy (JA05)  
complicating obstetric surgery and procedures (JB0D.3)

**Coded Elsewhere:** Neonatal cardiac failure (KB40)

**BD10**

### **Congestive heart failure**

A clinical syndrome characterised by abnormalities of ventricular function and neurohormonal regulation which are accompanied by effort intolerance and fluid retention.

**Coding Note:** Code also the causing condition

**Inclusions:** Congestive heart disease

**BD11**

### **Left ventricular failure**

A clinical syndrome characterised by abnormalities of left ventricular function resulting in pulmonary congestion and fluid retention.

**Coding Note:** Code also the causing condition

**Inclusions:** Left heart failure

**BD11.0**

### **Left ventricular failure with preserved ejection fraction**

A syndrome of left ventricular dysfunction occurring with normal or relatively preserved ejection fraction

**Coding Note:** Code also the causing condition

**BD11.1**

### **Left ventricular failure with mid range ejection fraction**

**Coding Note:** Code also the causing condition

**BD11.2**

### **Left ventricular failure with reduced ejection fraction**

A syndrome of left ventricular dysfunction associated with reduced ejection fraction.

**Coding Note:** Code also the causing condition

**BD11.Z**

### **Left ventricular failure, unspecified**

**Coding Note:** Code also the causing condition

**BD12**

### **High output syndromes**

Increased cardiac output above normal associated with anaemia, arteriovenous fistulas, thyrotoxicosis and other syndromes. May result in heart failure.

**BD13**

### **Right ventricular failure**

Heart failure associated with right ventricular dysfunction manifest by distention of the neck veins, enlargement of the liver, and dependent oedema.

**Coding Note:** Code also the causing condition

**BD14**

### **Biventricular failure**

**Coding Note:** Code also the causing condition

**BD1Y**      **Other specified heart failure**

**Coding Note:** Code also the causing condition

**BD1Z**      **Heart failure, unspecified**

**Coding Note:** Code also the causing condition

## Diseases of arteries or arterioles (BD30-BD5Z)

**Exclusions:** Diseases of coronary artery (BA81-BA8Z)

**BD30**      **Acute arterial occlusion**

**Coding Note:** Code also the causing condition

**BD30.0**      **Acute upper limb arterial occlusion**

**BD30.00**      Acute thromboembolic upper limb arterial occlusion

**BD30.01**      Acute thrombotic upper limb arterial occlusion

**BD30.0Y**      Other specified acute upper limb arterial occlusion

**BD30.0Z**      Acute upper limb arterial occlusion, unspecified

**BD30.1**      **Acute aortoiliac occlusion**

**BD30.10**      Acute thromboembolic aortoiliac occlusion

**BD30.11**      Acute thrombotic aortoiliac occlusion

**BD30.1Y**      Other specified acute aortoiliac occlusion

**BD30.1Z**      Acute aortoiliac occlusion, unspecified

**BD30.2**      **Acute lower limb arterial occlusion**

**BD30.20**      Acute thromboembolic lower limb arterial occlusion

**BD30.21**      Acute thrombotic lower limb arterial occlusion

**BD30.2Y**      Other specified acute lower limb arterial occlusion

**BD30.2Z**      Acute lower limb arterial occlusion, unspecified

**BD30.Y**      **Other specified acute arterial occlusion**

**Coding Note:** Code also the causing condition

**BD30.Z**      **Acute arterial occlusion, unspecified**

**Coding Note:** Code also the causing condition

Chronic arterial occlusive disease (BD40-BD4Z)

**Coded Elsewhere:** Secondary peripheral angiopathy (BD53.Y)

**BD40**

**Atherosclerotic chronic arterial occlusive disease**

**Inclusions:** endarteritis deformans

senile arteritis

senile endarteritis

**Exclusions:** Chronic vascular disorders of intestine (DD31)

Cerebral ischaemic stroke due to intracranial large artery atherosclerosis (8B11.1)

Coronary atherosclerosis (BA52)

Chilblains (NF03.0)

Frostbite (NE40-NE4Z)

Cerebral ischaemic stroke due to extracranial large artery atherosclerosis (8B11.0)

Asymptomatic stenosis of intracranial or extracranial artery (BD55)

**Coded Elsewhere:** Atherosclerotic retinopathy (BD40.Y)

**BD40.0**

**Lower limb atherosclerosis**

This is a condition in which an artery wall thickens as a result of the accumulation of fatty materials such as cholesterol, of the lower limb.

**BD40.1**

**Atherosclerosis of aorta**

**BD40.2**

**Atherosclerosis of renal artery**

**Exclusions:** atherosclerosis of renal arterioles (BA02)

**BD40.3**

**Aortic bifurcation syndrome**

**BD40.Y**

**Other specified atherosclerotic chronic arterial occlusive disease**

**BD40.Z**

**Atherosclerotic chronic arterial occlusive disease, unspecified**

**BD41**

**Non-atherosclerotic chronic arterial occlusive disease**

A heterogeneous group of disorders which may present with symptoms suggestive of atherosclerotic peripheral arterial disease (e.g. intermittent claudication) but in which arterial or arteriolar occlusion is due to other causes such as fibromuscular dysplasia, thromboarteritis obliterans and calcific arteriolopathy.

**Coded Elsewhere:** Thromboangiitis obliterans (4A44.8)

Calcific arteriolopathy (EB90.42)

**BD41.0**

**Arterial fibromuscular dysplasia**

Fibromuscular dysplasia, formerly called fibromuscular fibroplasia, is a group of nonatherosclerotic, noninflammatory arterial diseases that most commonly involve the renal and carotid arteries.

**BD41.Y**

**Other specified non-atherosclerotic chronic arterial occlusive disease**

**BD41.Z** **Non-atherosclerotic chronic arterial occlusive disease, unspecified**

**BD42** **Raynaud phenomenon**

Raynaud phenomenon describes an exaggerated vascular response to cold temperature or emotional stimuli resulting in episodic digital ischaemia. It is characterised by paroxysmal vasoconstriction producing initially pallor, an essential component for the diagnosis, followed by cyanosis and erythema. Primary Raynaud disease is an isolated innocuous disorder. Secondary Raynaud phenomenon occurs in association with a wide range of different disorders including dysproteinaemias and non-organ-specific systemic autoimmune diseases.

**BD42.0** **Primary Raynaud disease**

Raynaud phenomenon unassociated with any concomitant disease, drug or other provoking trauma. Criteria for diagnosis include: bilateral symmetrical episodic attacks without evidence of peripheral vascular disease or tissue injury, normal nail fold capillaroscopy, negative antinuclear antibody and normal erythrocyte sedimentation rate.

**Inclusions:** Raynaud disease

**BD42.1** **Secondary Raynaud phenomenon**

**Coding Note:** Code also the causing condition

**BD42.Z** **Raynaud phenomenon, unspecified**

**BD4Y** **Other specified chronic arterial occlusive disease**

**BD4Z** **Chronic arterial occlusive disease, unspecified**

**BD50** **Aortic aneurysm or dissection**

Aortic aneurysm is a term for any swelling (dilation or aneurysm) of the aorta to greater than 1.5 times normal, usually representing an underlying weakness in the wall of the aorta at that location. Aortic dissection occurs when a tear in the inner wall of the aorta causes blood to flow between the layers of the wall of the aorta, forcing the layers apart.

**Coded Elsewhere:** Postprocedural true or false aortic aneurysm (BE13)

Aortic aneurysm due to congenital heart disease (LA8Y)

**BD50.0** **Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch**

This occurs when a tear in the inner wall of the aorta causes blood to flow between the layers of the wall of the aorta, forcing the layers apart: ascending aorta dissection and propagation beyond arch.

**BD50.00** Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch with perforation

**BD50.01** Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch with rupture

**BD50.02** Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch without mention of perforation or rupture

<b>BD50.0Y</b>	Other specified thoracic aortic dissection, ascending aorta dissection and propagation beyond arch
<b>BD50.0Z</b>	Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch, unspecified
<b>BD50.1</b>	<b>Ascending aorta dissection not beyond arch</b>
<b>BD50.10</b>	Ascending aorta dissection not beyond arch with perforation
<b>BD50.11</b>	Ascending aorta dissection not beyond arch with rupture
<b>BD50.12</b>	Ascending aorta dissection not beyond arch without mention of perforation or rupture
<b>BD50.1Y</b>	Other specified ascending aorta dissection not beyond arch
<b>BD50.1Z</b>	Ascending aorta dissection not beyond arch, unspecified
<b>BD50.2</b>	<b>Descending aorta dissection and distal propagation</b>
	This occurs when a tear in the inner wall of the aorta causes blood to flow between the layers of the wall of the aorta, forcing the layers apart, and distal propagation.
<b>BD50.20</b>	Descending aorta dissection and distal propagation with perforation
<b>BD50.21</b>	Descending aorta dissection and distal propagation with rupture
<b>BD50.22</b>	Descending aorta dissection and distal propagation without mention of perforation or rupture
<b>BD50.2Y</b>	Other specified descending aorta dissection and distal propagation
<b>BD50.2Z</b>	Descending aorta dissection and distal propagation, unspecified
<b>BD50.3</b>	<b>Thoracic aortic aneurysm</b>
<b>BD50.30</b>	Thoracic aortic aneurysm with perforation
<b>BD50.31</b>	Thoracic aortic aneurysm with rupture
<b>BD50.32</b>	Thoracic aortic aneurysm without mention of perforation or rupture
<b>BD50.3Y</b>	Other specified thoracic aortic aneurysm
<b>BD50.3Z</b>	Thoracic aortic aneurysm, unspecified
<b>BD50.4</b>	<b>Abdominal aortic aneurysm</b>
<b>BD50.40</b>	Abdominal aortic aneurysm with perforation
<b>BD50.41</b>	Abdominal aortic aneurysm with rupture
<b>BD50.4Y</b>	Other specified abdominal aortic aneurysm
<b>BD50.4Z</b>	Abdominal aortic aneurysm, unspecified
<b>BD50.5</b>	<b>Thoracoabdominal aortic aneurysm</b>
<b>BD50.50</b>	Thoracoabdominal aortic aneurysm with perforation

<b>BD50.51</b>	Thoracoabdominal aortic aneurysm with rupture
<b>BD50.52</b>	Thoracoabdominal aortic aneurysm without mention of perforation or rupture
<b>BD50.5Y</b>	Other specified thoracoabdominal aortic aneurysm
<b>BD50.5Z</b>	Thoracoabdominal aortic aneurysm, unspecified
<b>BD50.Z</b>	<b>Aortic aneurysm or dissection, unspecified</b>
<b>BD51</b>	<b>Arterial aneurysm or dissection, excluding aorta</b>
	<i><b>Exclusions:</b></i>
	Aneurysm of pulmonary artery (BB02.1)
	aneurysm of heart (BA41)
	aneurysm of varicose (BD52.1)
	aneurysm of retinal (9B78.1)
	dissection of precerebral artery, congenital (nonruptured) (LA90.41)
	aneurysm (of): aorta (BD50)
	aneurysm (of): arteriovenous NOS acquired (BD52.1)
	Cerebral aneurysm, nonruptured (8B22.5)
	Coronary artery aneurysm (BA81)
	ruptured cerebral aneurysm (8B01.0)
<b>BD51.0</b>	<b>Aneurysm or dissection of carotid artery</b>
<b>BD51.1</b>	<b>Aneurysm or dissection of vertebral artery</b>
<b>BD51.2</b>	<b>Aneurysm or dissection of other precerebral arteries</b>
	<i><b>Exclusions:</b></i>
	Aneurysm or dissection of carotid artery (BD51.0)
	Aneurysm or dissection of vertebral artery (BD51.1)
<b>BD51.3</b>	<b>Aneurysm or dissection of artery of upper extremity</b>
<b>BD51.4</b>	<b>Aneurysm or dissection of renal artery</b>
<b>BD51.5</b>	<b>Aneurysm or dissection of iliac artery</b>
<b>BD51.6</b>	<b>Aneurysm or dissection of artery of lower extremity</b>
<b>BD51.Y</b>	<b>Aneurysm and dissection of other artery, excluding aorta</b>
<b>BD51.Z</b>	<b>Aneurysm and dissection of unspecified artery</b>
<b>BD52</b>	<b>Certain specified disorders of arteries or arterioles</b>
	<i><b>Exclusions:</b></i>
	collagen (vascular) diseases (4A40-4A4Z)
	Hypersensitivity angiitis (4A44.B)
	Acute arterial occlusion (BD30)
	Chronic arterial occlusive disease (BD40-BD4Z)

<b>BD52.0</b>	<b>Segmental arterial mediolysis</b> Segmental arterial mediolysis is a rare noninflammatory vascular disease of the abdominal splanchnic arteries, characterised by disruption of the arterial medial layer. It will induce multiple aneurysms in mesenteric arteries with susceptibility to vessel dissection, haemorrhage and mesenteric ischemia.
<b>BD52.1</b>	<b>Arteriovenous fistula, acquired</b> <b>Exclusions:</b> Cerebral aneurysm, nonruptured (8B22.5) traumatic - see injury of blood vessel by body region (Chapter 22) Coronary artery aneurysm (BA81)
<b>BD52.2</b>	<b>Stricture of artery</b>
<b>BD52.3</b>	<b>Rupture of artery</b> <b>Exclusions:</b> traumatic rupture of artery - see injury of blood vessel by body region (Chapter 22)
<b>BD52.4</b>	<b>Necrosis of artery</b>
<b>BD52.5</b>	<b>Coeliac artery compression syndrome</b>
<b>BD52.6</b>	<b>Congenital great vessel related acquired abnormality</b> Any postnatal pathological change in form or function of the heart and/or great vessels consequent to the presence of congenital cardiovascular disease. <b>Exclusions:</b> Acquired systemic vein abnormality (BD73) Acquired pulmonary venous abnormality (BB03) Acquired pulmonary arterial tree abnormality (BB02.3) <b>Coded Elsewhere:</b> Acquired abnormality of congenitally malformed valve (BC02) Postprocedural arterial duct disorder (BE14.A) Acquired narrowing of constructed cardiac intraventricular tunnel (BE14.B) Acquired subaortic stenosis (BB70.Y) Acquired pulmonary atresia (BB90.Y) Cardiac conduit related disorder (BE14.B) Superior cavopulmonary anastomosis related disorder (BE14.B) Systemic-to-pulmonary arterial shunt related disorder (BE14.B)
<b>BD52.7</b>	<b>Certain acquired abnormalities of aorta</b> A pathological change in form or function of the aorta that develops after birth. <b>Coded Elsewhere:</b> Recoarctation of the aorta (BE14.9)
<b>BD52.70</b>	Acquired abnormality of aortic arch branch A postnatal pathological change in form or function of one or more branches of the aortic arch.

<b>BD52.71</b>	Acquired ascending aorta or root dilation Enlargement of the luminal diameter of the aorta between the ventriculo-aortic junction and the origin of the first brachiocephalic branch above the upper limit of normal adjusted for body size that develops after birth  <b>Coded Elsewhere:</b> Postprocedural ascending aorta dilation (BE14.9)
<b>BD52.7Y</b>	Other specified certain acquired abnormalities of aorta
<b>BD52.7Z</b>	Certain acquired abnormalities of aorta, unspecified
<b>BD53</b>	<b>Secondary disorders of arteries and arterioles</b>
<b>Coding Note:</b>	Code also the causing condition
<b>BD53.0</b>	<b>Arterial cystic medial diseases</b>
<b>Coding Note:</b>	Code also the causing condition
<b>BD53.1</b>	<b>Hypothenar hammer syndrome</b>
<b>BD53.2</b>	<b>Iliac artery arteriopathy</b>
<b>BD53.3</b>	<b>Popliteal entrapment syndrome</b>
<b>BD53.4</b>	<b>Cholesterol atheroembolism</b>  Embolic occlusion of distal small arteries and arterioles by cholesterol crystals released from atherosclerotic plaque in larger more central arteries. The resultant microvascular ischaemia is accompanied by an inflammatory response to the presence of cholesterol crystals. This may occur spontaneously or as a complication of angiography or vascular surgery. Organs most commonly affected include the skin, kidneys, gastrointestinal tract, and brain. Cutaneous manifestations, present in the majority of cases, include livedo reticularis and focal ischaemic necrosis and ulceration; these are commonly associated with acute kidney injury.
<b>BD53.40</b>	Cholesterol atheroembolism to kidneys  This occurs when cholesterol is released, usually from an atherosclerotic plaque, and travels along with the bloodstream (embolism) to other places in the kidneys, where it obstructs blood vessels.
<b>BD53.4Y</b>	Cholesterol atheroembolism to other specified sites
<b>BD53.4Z</b>	Cholesterol atheroembolism to unspecified site
<b>BD53.Y</b>	<b>Other specified secondary disorders of arteries and arterioles</b>
<b>Coding Note:</b>	Code also the causing condition
<b>BD53.Z</b>	<b>Secondary disorders of arteries and arterioles, unspecified</b>
<b>Coding Note:</b>	Code also the causing condition

**BD54****Diabetic foot ulcer**

Chronic foot ulcers occur in as many as 15–25% of diabetic patients. The underlying aetiology is a combination of disturbed sensation from diabetic neuropathy and impaired perfusion from diabetic vasculopathy. Poor foot care, abnormal foot structure, or poorly fitting shoes increase the risk of diabetic foot ulcers. The ulcers typically occur in areas of increased plantar pressure, especially beneath the metatarsal heads.

**Coding Note:**

Always assign an additional code for diabetes mellitus.

**BD55****Asymptomatic stenosis of intracranial or extracranial artery**

Stenosis of intracranial or extracranial artery that has not caused TIA or cerebral ischemic stroke.

**Inclusions:** narrowing of basilar, carotid or vertebral arteries, not resulting in cerebral infarction

**Exclusions:** Transient ischaemic attack (8B10)  
Cerebral ischaemic stroke (8B11)

**BD56****Asymptomatic occlusion of intracranial or extracranial artery**

Occlusion of intracranial or extracranial artery that has not caused TIA or cerebral ischemic stroke.

**Exclusions:** Transient ischaemic attack (8B10)  
Cerebral ischaemic stroke (8B11)

**BD5Y****Other specified diseases of arteries or arterioles****BD5Z****Diseases of arteries or arterioles, unspecified****Diseases of veins (BD70-BD7Z)**

**Coded Elsewhere:** Other venous complications following abortion, ectopic or molar pregnancy (JA05.7)

Venous complications in pregnancy (JA61)

**BD70****Superficial thrombophlebitis**

**Coded Elsewhere:** Superficial thrombophlebitis in pregnancy (JA61.2)

Superficial thrombophlebitis in the puerperium (JB41.0)

**BD70.0****Superficial thrombophlebitis of lower limbs**

Inflammation and thrombosis of the superficial veins of the lower limbs affecting particularly varicose superficial leg veins.

**BD70.1****Superficial thrombophlebitis of upper limbs****BD70.2****Thrombophlebitis migrans**

Thrombophlebitis migrans is characterised by the development of recurrent and migratory superficial thrombophlebitis. It is an acquired coagulopathy that is strongly associated with malignancy, especially solid tumours of the adenocarcinoma type.

**Coding Note:**

Code also the causing condition

<b>BD70.3</b>	<b>Mondor disease</b> A form of localised superficial venous thrombophlebitis typically affecting the chest wall and manifesting as a fibrous cord with surrounding skin retraction and an absence of overlying cutaneous inflammation. No cause is found in many cases but trauma and breast surgery are often implicated.
	<b>Coded Elsewhere:</b> Mondor disease of the penis (GB06.3)
<b>BD70.Y</b>	<b>Other specified superficial thrombophlebitis</b>
<b>BD70.Z</b>	<b>Superficial thrombophlebitis, unspecified</b>
<b>BD71</b>	<p><b>Deep vein thrombosis</b> The process whereby thrombus (blood clot) forms in the large veins of the peripheral venous system. In addition to obstructing venous return it possesses a hazard whereby thrombus may detach and embolize to the pulmonary circulation.</p> <p><b>Coded Elsewhere:</b> Deep phlebothrombosis in pregnancy (JA61.3) Deep phlebothrombosis in the puerperium (JB41.1)</p>
<b>BD71.0</b>	<b>Upper limb deep vein thrombosis</b> Venous thrombosis within the deep veins of the upper limb.
<b>BD71.1</b>	<b>Vena caval thrombosis</b> Venous thrombosis within the vena cava.
<b>BD71.2</b>	<b>Renal vein thrombosis</b> Venous thrombosis within the renal vein
<b>BD71.3</b>	<b>Iliac vein thrombosis</b> Venous thrombosis within the iliac veins.
<b>BD71.4</b>	<b>Lower limb deep vein thrombosis</b> Thrombosis within the deep venous system of the lower limb. <b>Inclusions:</b> deep vein thrombosis NOS
<b>BD71.Y</b>	<b>Other specified deep vein thrombosis</b>
<b>BD72</b>	<b>Venous thromboembolism</b>
<b>BD73</b>	<p><b>Acquired systemic vein abnormality</b> A postnatal pathological change in form or function of a systemic vein.</p> <p><b>BD73.0</b> <b>Acquired inferior caval vein abnormality</b> A postnatal pathological change in form or function of the inferior caval vein (inferior vena cava).</p> <p><b>Coded Elsewhere:</b> Inferior caval vein obstruction due to foreign body (BE1C)</p>

- BD73.1** **Acquired superior caval vein abnormality**  
A postnatal pathological change in form or function of the superior caval vein (superior vena cava).  
**Coded Elsewhere:** Superior caval vein obstruction due to foreign body (BE1D)
- BD73.2** **Systemic vein obstruction**  
A postnatal pathologic condition of a systemic vein in which flow is impeded or blocked due to narrowing or atresia.
- BD73.20** Obstruction of peripheral vein  
A postnatal pathologic condition of a peripheral vein in which flow is impeded or blocked due to narrowing or atresia.
- BD73.21** Obstruction of visceral vein  
A postnatal pathologic condition of a visceral vein in which flow is impeded or blocked due to narrowing or atresia.
- BD73.2Y** Other specified systemic vein obstruction
- BD73.2Z** Systemic vein obstruction, unspecified
- BD73.3** **Acquired coronary sinus abnormality**  
A postnatal pathologic change in form or function of the coronary sinus.
- BD73.Y** Other specified acquired systemic vein abnormality
- BD73.Z** Acquired systemic vein abnormality, unspecified
- BD74** **Chronic peripheral venous insufficiency of lower extremities**  
The presence of increased pressure in the peripheral venous system, particularly of the lower extremities. Peripheral venous hypertension may be due to incompetence of venous valves following deep vein thrombosis but other factors including obesity may also impair venous return. The consequences of chronic peripheral venous insufficiency include varicose veins, venous ulceration and lymphoedema.  
**Coded Elsewhere:** Lymphoedema due to venous insufficiency (BD93.10)
- BD74.0** **Uncomplicated lower limb venous hypertension**  
The presence of lower limb venous incompetence or hypertension as may be manifest by the presence of haemosiderin pigmentation of the skin, telangiectasia or finely dilated superficial veins.  
**Coded Elsewhere:** Lower limb venous telangiectases (EF20.2)

- BD74.1**      **Lower limb varicose veins**  
The commonest manifestation of chronic peripheral venous insufficiency, varicose veins present as dilatation and tortuosity of the superficial veins of the lower extremities. Incompetence of the superficial venous valve system impedes the return of venous blood to the heart. Chronically increased venous pressure causes symptoms like heaviness, discomfort, extremity fatigue, itching, and dull or burning pain.
- Inclusions:**      complicating: puerperium (JB41)
- Coded Elsewhere:** Varicose veins of lower extremity in pregnancy (JA61.0)
- BD74.10**      Varicose veins with great saphenous reflux  
Varicose veins associated with reflux within the great saphenous vein, normally as the result of valve incompetence: this can be due to congenitally weak valves or following injury from direct trauma or venous thrombosis.
- BD74.11**      Varicose veins with small saphenous reflux  
Varicose veins associated with reflux within the small saphenous vein, normally as the result of valve incompetence: this can be due to congenitally weak valves or following injury from direct trauma or venous thrombosis.
- BD74.12**      Varicose veins with non-truncal reflux  
Varicose veins associated with reflux sparing the main truncal veins of the lower limb.
- BD74.1Z**      Lower limb varicose veins, not further specified
- BD74.2**      **Lipodermatosclerosis**  
Lipodermatosclerosis is a form of panniculitis of the lower legs that develops in the context of venous insufficiency, giving rise to features that include oedema, erythema, hyperpigmentation and induration. In the acute phase tenderness, erythema and oedema predominate and may mimic cellulitis. As the condition becomes chronic, post-inflammatory pigmentation, fibrosis and lymphoedema predominate, sometimes resulting in the lower leg assuming an “inverted champagne bottle” appearance.
- BD74.3**      **Venous leg ulcer**  
Venous leg ulcers are chronic skin ulcers of the gaiter area (ankle and lower leg) due to chronic peripheral venous hypertension. They are often associated with other manifestations of chronic peripheral venous insufficiency of the lower extremities including lower limb varicose veins and lipodermatosclerosis.
- Inclusions:**      Gravitational ulcer  
                        Varicose ulcer
- BD74.30**      Primary venous leg ulcer  
A venous leg ulcer developing in skin without preceding episodes of ulceration.

<b>BD74.31</b>	Recurrent venous leg ulcer A venous leg ulcer developing in skin which has been damaged by previous episodes of ulceration. The chances of long-term healing are reduced in comparison with primary venous leg ulcers.
<b>BD74.32</b>	Healed venous leg ulcer
<b>BD74.3Z</b>	Venous leg ulcer, unspecified
<b>BD74.Z</b>	<b>Chronic peripheral venous insufficiency of lower extremities, unspecified</b>
<b>BD75</b>	<p><b>Venous varicosities of sites other than lower extremity</b></p> <p><b>Exclusions:</b>      retinal varices (9B78.1)                                  Duodenal varices (DA52.0)</p> <p><b>Coded Elsewhere:</b> Gastric varices (DA43.0)                                  Oesophageal varices (DA26.0)</p>
<b>BD75.0</b>	<p><b>Sublingual varices</b>           Varicose veins on the underside of the tongue</p>
<b>BD75.1</b>	<p><b>Scrotal varices</b>  <b>Inclusions:</b>      Varicocele of scrotum</p>
<b>BD75.2</b>	<p><b>Vulval varices</b>           Congested and dilated vulval veins, occurring particularly in association with pregnancy.</p> <p><b>Exclusions:</b>      complicating: childbirth and the puerperium (JB41)                                  Genital varices in pregnancy (JA61.1)</p>
<b>BD75.3</b>	<p><b>Pelvic varices</b>           The presence of dilated and incompetent ovarian and pelvic veins in women. These may cause no symptoms but may be associated with chronic pelvic pain (pelvic congestion syndrome) or with externally apparent vulvovaginal varicosities.</p>
<b>BD75.Y</b>	<b>Venous varicosities of other specified sites</b>
<b>BD75.Z</b>	<b>Venous varicosities of unspecified site</b>
<b>BD7Y</b>	<b>Other specified diseases of veins</b>
<b>BD7Z</b>	<b>Diseases of veins, unspecified</b>

## Disorders of lymphatic vessels or lymph nodes (BD90-BD9Z)

Disorders due to developmental and acquired disturbances of lymph circulation and drainage and to infective disorders of lymph vessels and nodes.

**Exclusions:** Enlarged lymph nodes (MA01)

**Coded Elsewhere:** Lymphatic malformations (LA90.1)

**BD90**

### Lymphadenitis

**Exclusions:** human immunodeficiency virus [HIV] disease resulting in generalized lymphadenopathy (1C60-1C62.Z)

Enlarged lymph nodes (MA01)

lymphadenopathy (MA01)

Malignant neoplasm metastasis in lymph nodes (2D60-2D6Z)

**BD90.0**

### Acute lymphadenitis

**Exclusions:** Nonspecific mesenteric lymphadenitis (BD90.1)

Chronic lymphadenitis (BD90.2)

human immunodeficiency virus [HIV] disease resulting in generalized lymphadenopathy (1C60-1C62.Z)

enlarged lymph nodes (MA01)

**BD90.1**

### Nonspecific mesenteric lymphadenitis

**BD90.2**

### Chronic lymphadenitis

**Exclusions:** Enlarged lymph nodes (MA01)

Nonspecific mesenteric lymphadenitis (BD90.1)

Tuberculosis of intrathoracic lymph nodes, confirmed bacteriologically or histologically (1B10.0)

Tuberculosis of intrathoracic lymph nodes, without mention of bacteriological or histological confirmation (1B10)

Tuberculous peripheral lymphadenopathy (1B12.6)

**BD90.20**

Chronic cervical lymphadenitis

**BD90.21**

Chronic axillary lymphadenitis

**BD90.22**

Chronic inguinal lymphadenitis

**BD90.2Y**

Other specified chronic lymphadenitis

**BD90.2Z**

Chronic lymphadenitis, unspecified

**BD90.Y**

Other specified lymphadenitis

**BD90.Z**

Lymphadenitis, unspecified

**BD91****Lymphangitis**

Lymphangitis is an inflammation of lymphatic vessels. It is most often caused by infection from bacteria, virus or fungus or infiltration by cancer cells.

**Coding Note:**

Code first any underlying infection.

**Exclusions:** Lymphocutaneous sporotrichosis (1F2J.0)

**Coded Elsewhere:** Ascending bacterial lymphangitis (1B70.3)

Sclerosing lymphangitis of penis (GB06.5)

**BD92****Lymphangiectasia****BD92.0****Intestinal lymphangiectasia**

Intestinal lymphangiectasia is a pathologic dilation of lymph vessels of intestinal mucosa. This results in lymph leakage into the small bowel lumen and responsible for protein-losing enteropathy.

**Coded Elsewhere:** Primary intestinal lymphangiectasia (LB15.Y)

**BD92.1****Cutaneous lymphangiectasia****BD92.Z****Lymphangiectasia, unspecified****BD93****Lymphoedema**

Swelling due to the excess accumulation of lymph in the tissues caused by inadequate lymph drainage. It typically affects the extremities but may involve any body site. It is disfiguring and increases susceptibility to recurrent infection and local malignancy.

**BD93.0****Primary lymphoedema**

Lymphoedema as a result of lymphatic vessel hypoplasia

**Coded Elsewhere:** Yellow nail syndrome (EE11.1)

Noonan syndrome (LD2F.15)

**BD93.1****Secondary lymphoedema**

Lymphoedema as a result of an identifiable cause that renders insufficient the function of existing lymphatic vessels.

**Coding Note:**

Code also the causing condition

**BD93.10****Lymphoedema due to venous insufficiency**

Permanent lymphoedema, usually of the lower extremities, resulting from venous hypertension and chronic gravitational oedema.

**Coding Note:**

Code also the causing condition

**BD93.11****Lymphoedema due to dependency and immobility**

Lymphoedema occurring in immobile individuals with reduced muscle pump activity as a result of paralysis or infirmity. It is particularly liable to develop in those who are unable to sleep recumbent.

**Coding Note:**

Code also the causing condition

<b>BD93.12</b>	Lymphoedema due to obesity Lymphoedema resulting from morbid obesity. Lymphoedema of the lower limbs and lymphoedema of the abdominal apron fold are common sequelae of chronic morbid obesity.
<b>Coding Note:</b>	Code also the causing condition
<b>BD93.13</b>	Lymphoedema due to lymphatic filariasis Lymphoedema resulting from infestation of lymphatics by nematode worms of the genera Wuchereria and Brugia. This is the commonest cause of lymphoedema worldwide. The lymphoedema may present years after initial infection and most commonly affects the legs and male genitalia.
<b>Coding Note:</b>	Code also the causing condition
<b>BD93.14</b>	Lymphoedema due to podoconiosis Lymphoedema of the lower limbs resulting from an inflammatory response within lymphatic vessels to mineral particles from soil in genetically susceptible individuals. It is a leading cause of lower limb lymphoedema in farmers in Africa, Central America and India.
<b>Coding Note:</b>	Code also the causing condition
<b>BD93.15</b>	Lymphoedema due to malignant infiltration Lymphoedema resulting from obstruction of draining lymphatics as a result of infiltration by malignant, usually metastatic cells.
<b>Coding Note:</b>	Code also the causing condition
<b>BD93.1Y</b>	Lymphoedema secondary to other specified cause
<b>Coding Note:</b>	Code also the causing condition
<b>BD93.1Z</b>	Secondary lymphoedema, unspecified
<b>Coding Note:</b>	Code also the causing condition
<b>BD93.Y</b>	<b>Other specified forms of lymphoedema</b>
<b>BD93.Z</b>	<b>Lymphoedema, unspecified</b>
<b>BD9Y</b>	<b>Other specified disorders of lymphatic vessels or lymph nodes</b>
<b>BD9Z</b>	<b>Disorders of lymphatic vessels or lymph nodes, unspecified</b>

## Postprocedural disorders of circulatory system (BE10-BE1F.1)

This refers to postprocedural disorders of the organ system that passes nutrients (such as amino acids, electrolytes and lymph), gases, hormones, blood cells, etc. to and from cells in the body to help fight diseases, stabilize body temperature and pH, and to maintain homeostasis, not elsewhere classified.

**Coded Elsewhere:** Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

- Prosthetic valve disease (BC01)
- Coronary artery fistula, acquired (BA83)
- Dysfunction or complication of pacemaker, pacemaker lead or implantable cardioverter defibrillator, not elsewhere classified (NE82)
- Postprocedural complete atrioventricular block (BC63.21)
- Postprocedural obstructed systemic venous pathway (BD73.2Y)
- Postprocedural left pulmonary artery stenosis (BB02.3)
- Postprocedural inferior caval vein complication (BD73.0)
- Postprocedural superior caval vein complication (BD73.1)
- Postoperative junctional ectopic tachycardia (BC81.1)

### BE10

#### **Postcardiotomy syndrome**

Postcardiotomy syndrome is a hypersensitivity reaction to antigen derived from injured myocardium 3 weeks to 2 months after myocardial infarction, cardiac surgery, or penetrating and non penetrating heart injury. The diagnosis is made by history of heart injury, and exclusion of other diseases such as congestive heart failure, recurrent myocardial infarction, endocarditis, myocarditis, and pericarditis.

### BE11

#### **Other functional disturbances following cardiac surgery**

### BE12

#### **Postprocedural valve disorders**

##### BE12.0

#### **Postprocedural mitral valve stenosis**

##### BE12.1

#### **Postprocedural mitral valve insufficiency**

This is a postprocedural disorder of the heart in which the mitral valve does not close properly when the heart pumps out blood. It is the abnormal leaking of blood from the left ventricle, through the mitral valve, and into the left atrium, when the left ventricle contracts, i.e. there is regurgitation of blood back into the left atrium.

##### BE12.2

#### **Postprocedural aortic valve stenosis**

**Coded Elsewhere:** Stenosis of the neoaortic valve of pulmonary origin (BC02.30)

##### BE12.3

#### **Postprocedural aortic valve insufficiency**

This refers to postprocedural aortic valve of the heart that causes blood to flow in the reverse direction during ventricular diastole, from the aorta into the left ventricle.

**Coded Elsewhere:** Insufficiency of the neoaortic valve of pulmonary origin (BC02.31)

##### BE12.4

#### **Postprocedural tricuspid valve stenosis**

- BE12.5 Postprocedural tricuspid valve insufficiency**  
This refers to the postprocedural failure of the heart's tricuspid valve to close properly during systole. As a result, with each heart beat some blood passes from the right ventricle to the right atrium, the opposite of the normal direction.
- BE12.6 Postprocedural pulmonary valve stenosis**
- BE12.7 Postprocedural pulmonary valve insufficiency**
- BE13 Postprocedural true or false aortic aneurysm**  
This refers to postprocedural true and false swelling (dilation or aneurysm) of the aorta to greater than 1.5 times normal, usually representing an underlying weakness in the wall of the aorta at that location.
- BE14 Postprocedural disorder of circulatory system following repair of congenital heart or great vessel anomaly**
- BE14.4 Acquired abnormality of the neopulmonary valve**  
A postnatal pathological change in form or function of the neopulmonary valve, that is, the native aortic valve that has become the functional neopulmonary valve after the arterial switch operation.
- BE14.40 Neopulmonary valve stenosis**  
Acquired obstruction to flow through the neopulmonary valve, that is, the native aortic valve that has become the functional neopulmonary valve after the arterial switch operation.  
**Exclusions:** Postprocedural pulmonary valve stenosis (BE12.6)
- BE14.41 Neopulmonary valve regurgitation**  
Acquired backward flow through the neopulmonary valve, that is, the native aortic valve that has become the functional neopulmonary valve after the arterial switch operation.  
**Exclusions:** Postprocedural pulmonary valve insufficiency (BE12.7)
- BE14.5 Postprocedural right-sided atrioventricular valvar abnormality in double-inlet ventricle**  
A postnatal pathological change in form or function of the right-sided atrioventricular valve in double inlet ventricle that occurred during or after an intervention.
- Coding Note:** Includes: right ventricular component and right-sided atrioventricular valve within a common atrioventricular junction (atrioventricular septal defect).  
**Exclusions:** Congenital anomaly of an atrioventricular valve or atrioventricular septum (LA87)

BE14.6	<b>Postprocedural left-sided atrioventricular valvar abnormality in double-inlet ventricle</b> A postnatal pathological change in form or function of the left-sided atrioventricular valve in double inlet ventricle that occurred during or after an intervention.
<b>Coding Note:</b>	Includes: left ventricular component and left-sided atrioventricular valve within a common atrioventricular junction (atrioventricular septal defect) in the setting of double inlet ventricle
	<b>Exclusions:</b> Congenital anomaly of an atrioventricular valve or atrioventricular septum (LA87)
BE14.7	<b>Postprocedural common atrioventricular valvar abnormality in double-inlet ventricle</b> A postnatal pathological change in form or function of the common atrioventricular valve in double inlet ventricle that occurred during or after an intervention.
BE14.8	<b>Postprocedural ventricular septal defect disorder</b> An event or occurrence affecting a ventricular septal defect that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome.
BE14.9	<b>Postprocedural aortic disorder related to congenital heart anomaly</b> An event or occurrence affecting the aorta consequent to the presence of congenital cardiovascular disease, that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome.
BE14.A	<b>Postprocedural arterial duct disorder</b> An event or occurrence affecting the arterial duct (ductus arteriosus) that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome.
BE14.B	<b>Postprocedural disorder following cardiovascular conduit or shunt procedure</b>
<b>BE15</b>	<b>Postprocedural pulmonary arterial tree disorder</b> An event or occurrence affecting the pulmonary arterial tree that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome.
BE15.0	<b>Postprocedural pulmonary trunk stenosis</b> Discrete narrowing of the luminal diameter of the pulmonary trunk (main pulmonary artery) (below the lower limit of normal adjusted for body size) that occurs during or after an intervention.
BE15.1	<b>Postprocedural right pulmonary artery stenosis</b> Discrete narrowing of the luminal diameter of one or more segments of the right pulmonary artery (below the lower limit of normal adjusted for body size) that occurs during or after an intervention.

**BE16****Postprocedural pulmonary venous disorder**

An event or occurrence affecting one or more pulmonary vein(s) that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome.

**BE17****Postprocedural residual or recurrent interatrial communication**

A persistent or recurrent hole or pathway between the atrial chambers, including intentional residual communications.

**BE19****Postprocedural ventricular abnormality****BE1A****Cardiac transplant associated coronary allograft vasculopathy**

Coronary artery intimal proliferation following cardiac transplantation, defined based on a combination of visual angiographic vessel descriptors in concert with measures of cardiac allograft function, according to the International Society for Heart and Lung Transplantation.

**BE1B****Lymphoedema due to surgery or radiotherapy**

Lymphoedema resulting from damage to draining lymphatics as a result of surgery or radiotherapy.

**BE1B.0****Postmastectomy lymphoedema syndrome****BE1B.1****Lymphoedema due to other medical or surgical procedures****BE1C****Inferior caval vein obstruction due to foreign body**

A postnatal pathologic condition of the inferior caval vein (inferior vena cava) in which flow is impeded or blocked by a foreign body.

**BE1D****Superior caval vein obstruction due to foreign body**

A postnatal pathologic condition of the superior caval vein (superior vena cava) in which flow is impeded or blocked by a foreign body.

**BE1E****Postprocedural right atrial complication**

An event or occurrence affecting the morphologically right atrium that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome

**BE1E.0****Postprocedural right atrial perforation**

Perforation of the morphologically right atrial wall that occurred during or after an intervention

**BE1E.1****Right atrial erosion due to implanted device**

Injury of the morphologically right atrial wall occurring as a direct result of chronic friction from an implanted device or wire

**BE1F****Postprocedural left atrial complication**

An event or occurrence affecting the morphologically left atrium that is associated with a healthcare intervention, is a departure from the desired course of events, and may cause, or be associated with, a suboptimal outcome

- BE1F.0**      **Postprocedural left atrial perforation**  
Perforation of the morphologically left atrial wall that occurred during or after an intervention
- BE1F.1**      **Left atrial erosion due to implanted device**  
Injury of the morphologically left atrial wall occurring as a direct result of chronic friction from an implanted device or wire
- BE2Y**      **Other specified diseases of the circulatory system**
- BE2Z**      **Diseases of the circulatory system, unspecified**

# CHAPTER 12

---

## Diseases of the respiratory system

This chapter has 79 four-character categories.

Code range starts with CA00

- Exclusions:**
- Endocrine, nutritional or metabolic diseases (Chapter 05)
  - Congenital malformations, deformations and chromosomal abnormalities (Chapter 20)
  - Injury, poisoning or certain other consequences of external causes (Chapter 22)
  - Certain conditions originating in the perinatal period (Chapter 19)
  - Certain infectious or parasitic diseases (Chapter 01)
  - Complications of pregnancy, childbirth and the puerperium (Chapter 18)

- Coded Elsewhere:**
- Neoplasms of the respiratory system
  - Developmental respiratory diseases
  - Symptoms, signs or clinical findings of the respiratory system (MD10-MD6Y)
  - Pulmonary heart disease or diseases of pulmonary circulation (BB00-BB0Z)
  - Sleep-related breathing disorders (7A40-7A4Z)
  - Diseases of the respiratory system complicating pregnancy, childbirth or the puerperium (JB64.5)

This chapter contains the following top level blocks:

- Upper respiratory tract disorders
- Certain lower respiratory tract diseases
- Lung infections
- Lung diseases due to external agents
- Respiratory diseases principally affecting the lung interstitium
- Pleural, diaphragm or mediastinal disorders
- Postprocedural disorders of the respiratory system
- Neoplasms of the respiratory system
- Developmental respiratory diseases

## Upper respiratory tract disorders (CA00-CA0Z)

This group of disorders refers to diseases of the upper airways (upper respiratory tract). The upper airways anatomically are complicated structures which extend from the airway openings at the nares and lips to the trachea. The term upper airways includes several anatomically distinct regions. The nose constitutes the upper segment, followed by the nasopharyngeal and oropharyngeal airways, which extend from the nasal choanae and oral cavity to the supraglottic space. The paranasal sinuses drain into the nasal cavities and are attached to the lateral, posterior, and superior aspects of the nose. The larynx divides the upper and lower airways, although some place it in the thoracic inlet.

**Exclusions:** Chronic obstructive pulmonary disease with acute exacerbation, unspecified (CA22.0)

**CA00**

### Acute nasopharyngitis

A disease of the upper respiratory tract, caused by an infection with rhinovirus. This disease is characterised by pharyngitis, runny nose, stuffy nose, or cough. Transmission is by inhalation of infected respiratory secretions, or direct contact.

**Exclusions:** Chronic nasopharyngitis (CA09.1)  
pharyngitis NOS (CA02)  
Acute pharyngitis (CA02)  
Chronic pharyngitis (CA09.2)  
rhinitis NOS (CA09.0)  
sore throat NOS (CA00-CA0Z)  
Vasomotor rhinitis (CA08.3)  
Chronic rhinitis (CA09.0)  
Allergic rhinitis (CA08.0)  
acute sore throat (CA02)  
chronic sore throat (CA09.2)

**CA01**

### Acute sinusitis

Recent onset and/or short duration inflammation of the mucosa in one or more of the paranasal sinuses (maxillary, ethmoid, frontal and sphenoid) arising from infection or other causes such as caries or injury to the teeth. Purulent discharge can be seen at the middle meatus and olfactory cleavage and patients complain of dysosmia, stuffy nose, fever, or localised tenderness or pain. Allergic rhinitis, nasal septum deformity or hypertrophic rhinitis are underlying diseases that may induce acute sinusitis.

**Exclusions:** sinusitis, chronic or NOS (CA0A)

**CA02**

### **Acute pharyngitis**

Acute pharyngitis is defined as an infection or irritation of the pharynx and/or tonsils and is a part of the common cold symptoms. The etiology is usually infectious, with most cases being of viral origin. Although virus infection is the primary cause, it is also caused by bacterial infection. The discomfort of a throat, a throat pain and swallowing pain often occur. Headache, general fatigueness, radiating pain to the ear and a cervical lymphadenitis also occur. Local finding demonstrates hyperaemic palatine tonsils and swelling of lymphoid follicles of posterior wall of pharynx. Patients with acute pharyngitis present most commonly with a sore throat. Other various symptoms can rise in these patients depending on their causing organisms.

**Inclusions:** acute sore throat

**Exclusions:** Acute laryngopharyngitis (CA04)

Peritonsillar abscess (CA0K.1)

Chronic pharyngitis (CA09.2)

Retropharyngeal or parapharyngeal abscess (CA0K.0)

**Coded Elsewhere:** Streptococcal pharyngitis (1B51)

Meningococcal pharyngitis (1C1C.Y)

**CA02.0**

### **Acute pharyngitis due to other bacteria**

Rapid onset inflammation of the pharynx, (back of the throat, between the tonsils and the voicebox (larynx)) due to a specifically identified organism not classified elsewhere.

**Exclusions:** Viral infections characterised by skin or mucous membrane lesions (1E70-1F0Z)

**Coded Elsewhere:** Gonococcal pharyngitis (1A72.3)

**CA02.1**

### **Acute viral pharyngitis**

**Coded Elsewhere:** Enteroviral vesicular pharyngitis (1F05.1)

**CA02.10**

### **Pharyngitis due to Adenovirus**

Pharyngitis is an inflammation of the mucous membranes and underlying structures of the throat. Adenoviral pharyngitis is a self-limiting disease associated with fever, erythema of the pharynx, enlarged tonsils with exudate and enlarged cervical lymph nodes accompanied by fever, malaise, myalgia and abdominal pain. Frequently occurs with self-limiting conjunctivitis (refer to pharyngoconjunctival fever), laryngotracheitis, bronchitis and pneumonia.

**CA02.1Y**

Other specified acute viral pharyngitis

**CA02.1Z**

Acute viral pharyngitis, unspecified

**CA02.Y**

**Other specified acute pharyngitis**

**CA02.Z**

**Acute pharyngitis, unspecified**

<b>CA03</b>	<b>Acute tonsillitis</b>
	<p><b>Exclusions:</b> Streptococcal pharyngitis (1B51)            Acute pharyngitis (CA02)            Peritonsillar abscess (CA0K.1)</p>
<b>CA03.0</b>	<b>Streptococcal tonsillitis</b>
	A disease of the tonsils, caused by an infection with the gram-positive bacteria Streptococcus pyogenes (Streptococcus group A). This disease is characterised by a sore throat, fever, tonsillar exudates, or cervical adenopathy. This disease may also present with odynophagia, dysphagia, otalgia, dry tongue, erythematous, enlarged tonsils, or yellowish white spots on the tonsils. Transmission is commonly by inhalation of infected respiratory secretions or indirect contact. Confirmation is by identification of Streptococcus group A from a throat swab.
<b>CA03.Y</b>	<b>Other specified acute tonsillitis</b>
<b>CA03.Z</b>	<b>Acute tonsillitis, unspecified</b>
<b>CA04</b>	<b>Acute laryngopharyngitis</b>
	The most common upper respiratory tract infection is the common cold however, infections of laryngopharynx is also considered upper respiratory tract infections, of multiple sites.
<b>CA05</b>	<b>Acute laryngitis or tracheitis</b>
	Acute laryngitis and tracheitis are defined respectively as acute inflammation of larynx and trachea, with local findings of erythema, and oedema of laryngeal and tracheal mucosa. Acute laryngitis and tracheitis are induced by upper respiratory tract viral infections or voice abuse.
	<p><b>Exclusions:</b> Laryngismus (stridulus) (CA0H.4)            Acute obstructive laryngitis or epiglottitis (CA06)</p>
<b>CA05.0</b>	<b>Acute laryngitis</b>
	Rapid onset inflammation of the laryngeal mucosa, including the vocal cords. It is frequently characterised by irritation, oedema, and reduced pliability of the mucosa.
	<p><b>Exclusions:</b> Chronic laryngitis (CA0G)            Acute obstructive laryngitis or epiglottitis (CA06)</p>
<b>CA05.1</b>	<b>Acute tracheitis</b>
	This condition refers to the acute inflammation of the trachea.
	<p><b>Exclusions:</b> Chronic tracheitis (CA20.1)  <b>Coded Elsewhere:</b> Neonatal tracheitis (KB25)</p>
<b>CA05.2</b>	<b>Acute laryngotracheitis</b>
	Acute laryngotracheitis refers to the acute inflammation of both the larynx (laryngitis) and trachea (tracheitis).
	<p><b>Exclusions:</b> Chronic laryngitis or laryngotracheitis (CA0G)</p>
<b>CA06</b>	<b>Acute obstructive laryngitis or epiglottitis</b>

<b>CA06.0</b>	<b>Acute obstructive laryngitis</b> A condition commonly caused by an acute viral infection of the upper airway. This condition is characterised by a barking cough, stridor, hoarseness, or difficulty breathing. Transmission is commonly by inhalation of infected respiratory secretions.
	<b>Inclusions:</b> croup
<b>CA06.1</b>	<b>Acute epiglottitis</b> Acute epiglottitis is a special type of laryngeal inflammation, being characterised with a local swelling of epiglottis mucosa. Haemophilus influenzae type B infection is considered an important causative factor. Particularly in children, rapid exacerbation of dyspnoea can occur a couple of hours after the onset of this disease.
<b>CA06.Z</b>	<b>Acute obstructive laryngitis or epiglottitis, unspecified</b>
<b>CA07</b>	<b>Acute upper respiratory infections of multiple and unspecified sites</b>
	<b>Exclusions:</b> Influenza, virus not identified (1E32) influenza virus, identified (1E30)
<b>CA07.0</b>	<b>Acute upper respiratory infection, site unspecified</b>
<b>CA07.1</b>	<b>Acute upper respiratory infections of multiple sites</b>
<b>Coding Note:</b>	Assign additional codes for the specific infections.
<b>CA08</b>	<b>Vasomotor or allergic rhinitis</b> Rhinitis is inflammation of the nasal mucosa clinically characterised by major symptoms: sneezing, nasal pruritus, running nose, and stuffy nose.  Allergic rhinitis is an inflammation of nasal airway triggered by allergens to which the affected individual has previously been sensitized. Pathogenesis of allergic rhinitis is type I allergy on the nasal mucosa. Antigens inhaled into sensitized nasal mucosa bind to IgE antibodies on mast cells, which release chemical mediators such as histamine and peptide leukotriene. Consequently terminal of sensory neurons and vessels react to induce sneezing, running nose, and stuffy nose (immediate phase reaction). In late phase reaction, various chemical mediators are produced by mast cells, cytokines are produced by Th2 and mast cells, and chemokines are produced by epithelial cells, endothelium of blood vessels, and fibrocytes, respectively. These cell-derived transmitters actually induce various cell types of inflammatory cell infiltration to nasal mucosa. Among them, activated eosinophils is the main player of mucosal swelling and hyperreactivity.  Non-allergic rhinitis is an inflammation of nasal mucosa in which allergic mechanisms are not involved. It covers many different phenotypes.  <b>Exclusions:</b> rhinitis NOS (CA09.0)

<b>CA08.0</b>	<b>Allergic rhinitis</b> Allergic rhinitis is an inflammation of nasal airway triggered by allergens to which the affected individual has previously been sensitized. Pathogenesis of allergic rhinitis is type I allergy on the nasal mucosa. Antigens inhaled into sensitized nasal mucosa bind to IgE antibodies on mast cells, which release chemical mediators such as histamine and peptide leukotriene. Consequently terminal of sensory neurons and vessels react to induce sneezing, running nose, and stuffy nose (immediate phase reaction). In late phase reaction, various chemical mediators are produced by mast cells, cytokines are produced by Th2 and mast cells, and chemokines are produced by epithelial cells, endothelium of blood vessels, and fibrocytes, respectively. These cell-derived transmitters actually induce various cell types of inflammatory cell infiltration to nasal mucosa. Among them, activated eosinophils is the main player of mucosal swelling and hyperreactivity.
<b>CA08.00</b>	Allergic rhinitis due to pollen This condition is an allergic inflammation of the nasal airways. It occurs when an allergen, such as pollen, is inhaled by an individual with a sensitized immune system.
	<b>Inclusions:</b> Pollinosis
<b>CA08.01</b>	Allergic rhinitis due to other seasonal allergens This refers to other allergic inflammation of the nasal airways in patients with proven allergy to other allergens besides pollens and house dust mite, with multiple sensitization or as a component of complex conditions such as latex allergy. Clinically characterised by major symptoms: sneezing, nasal pruritus, running nose, and stuffy nose. It occurs when an allergen, such as animal dander (particles of shed skin and hair), insect (cockroach body particles), fungal particles, is inhaled by an individual with a sensitized immune system.
<b>CA08.02</b>	Allergic rhinitis due to house dust mite Allergic rhinitis triggered by the exposure to house dust mite allergens to which the affected individual has previously been sensitized.
<b>CA08.03</b>	Other allergic rhinitis This refers to other allergic inflammation of the nasal airways. It occurs when an allergen, such as pollen, dust or animal dander (particles of shed skin and hair) is inhaled by an individual with a sensitized immune system.
<b>CA08.0Z</b>	Allergic rhinitis, unspecified
<b>CA08.1</b>	<b>Non-allergic rhinitis</b> Non-allergic rhinitis is an inflammation of nasal mucosa in which allergic mechanisms are not involved. It covers many different phenotypes. <b>Coded Elsewhere:</b> Drug-induced rhinitis (4A85.0Y)

- CA08.10** Non-allergic rhinitis with eosinophils  
The non-allergic rhinitis with eosinophils is characterised by large numbers (inconsistently defined as >5% to >20%) of eosinophils on nasal smear. Patients usually have paroxysmal exacerbations of symptoms, including sneezing, profuse watery rhinorrhoea, nasal pruritus, nasal congestion, and occasional anosmia. It may precede the development of nasal polyposis and aspirin hypersensitivity. Patients with non-allergic rhinitis with eosinophils are at increased risk for the development of obstructive sleep apnoea.
- CA08.1Y** Other specified non-allergic rhinitis
- CA08.1Z** Non-allergic rhinitis, unspecified
- CA08.2** **Mixed rhinitis**  
Mixed rhinitis is a specific rhinitis subtype that combines characters of allergic rhinitis and non-infectious non-allergic rhinitis. It may represent between 50 and 70% of all allergic rhinitis cases.
- CA08.3** **Vasomotor rhinitis**  
Vasomotor rhinitis is a form of non-allergic inflammation of the nasal mucosa that is characterised by nasal congestion and posterior pharyngeal drainage. The non-allergic triggers cause dilation of the blood vessels in the lining of the nose, which results in swelling, and drainage.
- CA08.Y** **Mixed allergic and non-allergic rhinitis**
- CA08.Z** **Rhinitis, unspecified whether allergic or nonallergic**
- CA09** **Chronic rhinitis, nasopharyngitis or pharyngitis**  
The pathological condition of chronic rhinitis is a continuation of persistent inflammation on nasal turbinate mucosae, which is induced by microbial infection, irritation with inhaled substances and abnormal structure of nasal cavity. This condition induces nasal obstruction and increased nasal discharge. Pharyngitis is an inflammation of whole pharyngeal mucosa and lymphatic tissues and its acute symptoms are a part of the common cold symptoms. Although viral infection is the primary cause, it is also caused by bacterial infections. The discomfort of throat, throat pain and swallowing pain occur. Headache, general fatigueness, radiating pain to the ear and a cervical lymphadenitis also occur. Local finding demonstrates hyperaemic palatine tonsils and swelling of lymphoid follicles of posterior wall of pharynx. Chronic pharyngitis can be considered as a consequence of acute pharyngitis or effect of continuous stimuli, with symptoms of abnormal sensation of throat, discomfort, and foreign body sensation.
- CA09.0** **Chronic rhinitis**  
Persistent or recurrent inflammation of the nasal mucosa.  
**Exclusions:** Vasomotor rhinitis (CA08.3)  
Allergic rhinitis (CA08.0)

<b>CA09.1</b>	<b>Chronic nasopharyngitis</b> Persistent or recurrent inflammation of the top portion of the pharynx situated posterior to the nose and superior to the soft palate, usually including its mucosa, related lymphoid structure, and glands.  <b>Exclusions:</b> Acute nasopharyngitis (CA00)
<b>CA09.2</b>	<b>Chronic pharyngitis</b> Persistent or recurrent inflammation of the pharynx; the funnel-shaped fibromuscular tube which conducts food to the oesophagus and air to the larynx.  <b>Inclusions:</b> Chronic sore throat  <b>Exclusions:</b> Acute pharyngitis (CA02)
<b>CA0A</b>	<b>Chronic rhinosinusitis</b> Sinusitis is an inflammation of the mucosal lining of the paranasal sinuses secondary to both infectious and allergic mechanisms. The retention of sinus secretions is the most important event in the development of sinusitis. This creates a favourable milieu for the growth of infection agents and may be caused by the obstruction or narrowing of sinus ostia, mucociliary dysfunction and changes in mucus composition. 90% of sinus infections involve the maxillary sinus. Chronic sinusitis refers to symptom duration lasting 3 months or more. Diagnosis of sinusitis is based on past history and physical examination findings. The CT scan is the most sensitive technique in evaluating sinus disease. The goals of management of chronic sinusitis are to eradicate infection, to relieve ostiomeatal obstruction, to normalize mucociliary clearance, and to prevent complications. When pharmaceutical treatment does not have any remarkable improvement or when a surgical approach can be chosen as patient's complication, surgical intervention should be aimed to establish an effective sinus drainage from the ostium. Functional endoscopic sinus surgery (FESS) describes endoscopic techniques that have revolutionized the approach to sinus disease. The procedure is aimed at restoring the functional physiology of sinus aeration and drainage via the expanded ostiomeatal complex while minimizing surgical alteration of the normal anatomic pathways.  <b>Exclusions:</b> Acute sinusitis (CA01)
<b>CA0A.0</b>	<b>Samter syndrome</b> Samter syndrome is composed of asthma, aspirin intolerance, nasal polyps and chronic rhinosinusitis.
<b>CA0A.Y</b>	<b>Other specified chronic rhinosinusitis</b>
<b>CA0A.Z</b>	<b>Chronic rhinosinusitis, unspecified</b>
<b>CA0B</b>	<b>Silent sinus syndrome</b> Silent sinus syndrome is a spontaneous, asymptomatic collapse of the maxillary sinus and orbital floor associated with negative sinus pressures.

**CA0C****Cyst or mucocele of nose or nasal sinus**

A condition which refers to diseases of the nose and nasal sinus that cause a cyst or mucocele.

A mucocele is any dilatation (typically pathologic) with accumulation of mucus. Mucoceles are benign, epithelium-lined cysts filled with mucus, which can form in the paranasal sinuses. These structures may cause symptoms if sufficiently large or if exerting pressure on surrounding anatomic structures. Symptomatic mucoceles typically require surgical intervention. Mucoceles should be differentiated from sinus retention cysts. Unlike mucoceles, sinus retention cysts do not result in expansion and thinning of the bony sinus walls.

**CA0D****Deviated nasal septum****CA0E****Hypertrophy of nasal turbinates****CA0F****Chronic diseases of tonsils or adenoids**

Any persistent or recurrent disease affecting the round-to-oval mass of lymphoid tissue embedded in the lateral wall of the pharynx (tonsils) or the collection of lymphoid nodules on the posterior wall and roof of the nasopharynx (adenoids)

*Exclusions:* Recurrent acute tonsillitis (CA03)

**CA0F.0****Hypertrophy of tonsils**

*Inclusions:* Enlargement of tonsils

**CA0F.1****Hypertrophy of adenoids**

*Inclusions:* Enlargement of adenoids

**CA0F.3****Hypertrophy of tonsils with hypertrophy of adenoids**

This is an excessive growth ("hypertrophy") of the tissue of tonsils and adenoids.

**CA0F.Y****Other specified chronic diseases of tonsils or adenoids****CA0F.Z****Chronic diseases of tonsils or adenoids, unspecified****CA0G****Chronic laryngitis or laryngotracheitis**

Persistent or recurrent inflammation of the larynx (airway) and/or the larynx and the cartilaginous and membranous tube descending from the larynx and branching into the right and left main bronchi (trachea).

**CA0H****Diseases of vocal cords or larynx, not elsewhere classified**

*Exclusions:* stridor: NOS (MD11.B)

laryngitis: ulcerative (CA05.0)

Acute obstructive laryngitis (CA06.0)

Postprocedural subglottic stenosis (CB62)

<b>CA0H.0</b>	<b>Paralysis of vocal cords or larynx</b> Loss of function or feeling of one or both of the vocal folds, often caused by injury or disease to the nerves of the larynx.  <b>Coded Elsewhere:</b> Acquired vocal cord paralysis in newborn (KB2H) Congenital laryngeal palsy (LA71.Y)
<b>CA0H.1</b>	<b>Polyp of vocal cord or larynx</b> A polyp is an abnormal growth of tissue projecting from a mucous membrane, in this condition it is of the vocal cord and larynx.  <b>Exclusions:</b> adenomatous polyps (2F00)
<b>CA0H.2</b>	<b>Nodules of vocal cords</b>
<b>CA0H.3</b>	<b>Oedema of larynx</b> Laryngeal oedema is oedema (accumulation of fluid) which may occur for example in asaryepiglottic folds, epiglottis, the arytenoid region or submucosal of the subglottic region. It may occur due to anaphylaxis, angioneurotic oedema, larynx infection, foreign body or substance, or injury.  <b>Exclusions:</b> oedematous laryngitis (CA05.0) laryngitis: acute obstructive [croup] (CA06.0)
<b>CA0H.4</b>	<b>Laryngeal spasm</b> Laryngeal spasm is a pathological condition that is mainly a spasmodic closure (spasm) of the inlet portion of the larynx or the glottic region. There is an adult-onset and childhood (infant)-onset generally in this disease. There is a difference in the pattern of expression for these two types. In the infant, respiratory arrest is associated with this condition and spasmodic closure of the glottis occurs suddenly, and then breathing returns to original quite rapidly within a few minutes. In adults, the main symptoms of this condition are difficulty breathing or inspiratory stridor rather than a complete respiratory arrest.  <b>Inclusions:</b> laryngospasm
<b>CA0H.5</b>	<b>Stenosis of larynx</b> Laryngeal stenosis is an abnormal narrowing within the cavity of the larynx.
<b>CA0H.Y</b>	<b>Other specified diseases of vocal cords or larynx, not elsewhere classified</b>
<b>CA0H.Z</b>	<b>Diseases of vocal cords or larynx, not elsewhere classified, unspecified</b>
<b>CA0J</b>	<b>Nasal polyp</b> Nasal polyp is an inflammatory and proliferating mass arising from the epithelial linings of nasal cavity and paranasal sinuses. In general, nasal polyp appears to be greyish white, smoothly surfaced, and glutinous and agar-like mass. The pathogenesis is thought to be multifactorial.  <b>Exclusions:</b> adenomatous polyps (2F00)

<b>CA0J.0</b>	<b>Polypoid sinus degeneration</b>
	Also referred to as Woakes' syndrome or ethmoiditis. Woakes' syndrome is characterised by severe recurrent nasal polyps, often without eosinophils on histological examination and with broadening of the nose.
<b>CA0J.Y</b>	<b>Other specified nasal polyp</b>
<b>CA0J.Z</b>	<b>Nasal polyp, unspecified</b>
<b>CA0K</b>	<p><b>Abscess of upper respiratory tract</b></p> <p>Abscess of upper respiratory tract is defined as abscess formation which occurs from nose to pharynx and larynx. Abscess, furuncle and carbuncle of nose, retropharyngeal, parapharyngeal abscess and other abscess of pharynx are included in this classification.</p>
<b>CA0K.0</b>	<p><b>Retropharyngeal or parapharyngeal abscess</b></p> <p>A retropharyngeal abscess is an abscess located in the tissues in the back of the throat behind the posterior pharyngeal wall (the retropharyngeal space). A parapharyngeal abscess is an abscess developing in the potential space in the head and the neck.</p> <p><b>Exclusions:</b> Peritonsillar abscess (CA0K.1)</p>
<b>CA0K.1</b>	<p><b>Peritonsillar abscess</b></p> <p>Peritonsillar abscess is defined with abscess formation between the tonsillar capsule and the tonsillar constrictor muscles. Peritonsillar abscess mostly comes from peritonsillitis. Fever rise, pharyngeal pain and swallowing pain are the main symptoms, but, it also causes a muffled voice. Uvula is deviated to the unaffected side and swelling and redness around the affected tonsil is remarkable. Bacterial examination from the peritonsillar pus often reveal streptococcus group A beta-haemolytic as the aerobic bacteria and the detection rate of anaerobic bacteria also amounted to more than half. The treatment consists of antimicrobial therapy and incision and drainage of the abscess. The symptoms improve with above treatment in the most cases, while in some cases the abscess proceeds to a deadly deep neck infection and mediastinal abscess. If there are systemic complications such as diabetes mellitus, special attention is required.</p> <p><b>Inclusions:</b> Quinsy</p> <p><b>Exclusions:</b> Acute tonsillitis (CA03) Chronic tonsillitis (CA0F) tonsillitis, NOS (CA03) retropharyngeal abscess (CA0K.0)</p>
<b>CA0K.Y</b>	<b>Other specified abscess of upper respiratory tract</b>
<b>CA0K.Z</b>	<b>Abscess of upper respiratory tract, unspecified</b>
<b>CA0Y</b>	<b>Other specified upper respiratory tract disorders</b>
<b>CA0Z</b>	<b>Upper respiratory tract disorders, unspecified</b>

## Certain lower respiratory tract diseases (CA20-CA2Z)

This group refers to diseases of airways that forms the connection between the outside world and the terminal respiratory unit. Intrapulmonary airways are divided into three major groups; bronchi, membranous bronchiole, and respiratory bronchiole/gas exchange ducts.

**Coded Elsewhere:** Acute tracheitis (CA05.1)

Whooping cough (1C12)

Chronic respiratory disease originating in the perinatal period (KB29)

**CA20**

### **Bronchitis**

Bronchitis is inflammation of the main air passages to the lungs.

**Coding Note:** Excludes acute infectious bronchitis

**Exclusions:** bronchitis, asthmatic NOS (CA23.3)

bronchitis, chemical (acute) (CA81)

**Coded Elsewhere:** Acute bronchitis (CA42)

**CA20.0** **Acute noninfectious bronchitis**

**CA20.1** **Chronic bronchitis**

**Exclusions:** chronic asthmatic bronchitis (CA22.1)

chronic: bronchitis: with airways obstruction (CA22)

chronic: emphysematous bronchitis (CA22.1)

chronic: obstructive pulmonary disease NOS (CA22)

**CA20.10** Simple chronic bronchitis

**CA20.11** Mucopurulent chronic bronchitis

**CA20.12** Mixed simple and mucopurulent chronic bronchitis

**CA20.13** Protracted bacterial bronchitis

Protracted bacterial bronchitis (PBB) is a disease caused by the chronic infection of the conducting airways. The condition causes a persistent wet cough lasting more than four weeks that responds to antibiotic treatment.

**CA20.1Y** Other specified chronic bronchitis

**CA20.1Z** Chronic bronchitis, unspecified

**CA20.Y** **Other specified bronchitis**

**Coding Note:** Excludes acute infectious bronchitis

**CA20.Z** **Bronchitis, unspecified**

**Coding Note:** Excludes acute infectious bronchitis

**CA21**

## **Emphysema**

Emphysema is defined by abnormal and permanent enlargement of the airspaces that are distal to the terminal bronchioles. This is accompanied by destruction of the airspace walls, without obvious fibrosis (i.e. there is no fibrosis visible to the naked eye). Emphysema can exist in individuals who do not have airflow obstruction; however, it is more common among patients who have moderate or severe airflow obstruction.

- Inclusions:***
- Compensatory emphysema (CB40.4)
  - Interstitial emphysema originating in the perinatal period (KB27.0)
  - emphysema due to inhalation of chemicals, gases, fumes or vapours (CA81)
  - emphysema mediastinal (CB40.3)
  - Traumatic subcutaneous emphysema, not elsewhere classified (NF0A.7)
  - emphysema, surgical (subcutaneous) (NE81)
  - emphysema with chronic (obstructive) bronchitis (CA22)
  - emphysematous (obstructive) bronchitis (CA22.1)

**CA21.0**

### **MacLeod syndrome**

Decrease in size of one lung due to obliterating bronchiolitis, a congenital abnormality of other disorder resulting in hyperinflation of the normal lung.

**CA21.1**

### **Panlobular emphysema**

Panlobular (panacinar) emphysema destroys the entire alveolus uniformly and is predominant in the lower half of the lungs. Panlobular emphysema generally is observed in patients with homozygous alpha1-antitrypsin deficiency.

- Inclusions:***
- Panacinar emphysema

**CA21.2**

### **Centrilobular emphysema**

Centrilobular (centriacinar) emphysema begins in the respiratory bronchioles and spreads peripherally. This form is associated with long-standing cigarette smoking and predominantly involves the upper half of the lungs.

**CA21.Y**

### **Other specified emphysema**

**CA21.Z**

### **Emphysema, unspecified**

**CA22****Chronic obstructive pulmonary disease**

Chronic Obstructive Pulmonary disease (COPD), a common preventable and treatable disease, is characterised by persistent airflow limitation that is usually progressive and associated with an enhanced chronic inflammatory response in the airways and the lung to noxious particles or gases. Exacerbations and comorbidities contribute to the overall severity in individual patients.

***Exclusions:***

- Emphysema (CA21)
- chronic tracheobronchitis (CA20.1)
- chronic tracheitis (CA20.1)
- Simple or mucopurulent chronic bronchitis (CA20.1)
- asthmatic bronchitis NOS (CA23.3)
- Bronchiectasis (CA24)
- Asthma (CA23)
- chronic bronchitis NOS (CA20.1)

**CA22.0****Chronic obstructive pulmonary disease with acute exacerbation, unspecified**

An exacerbation of COPD is an acute event characterised by a worsening of the patient's respiratory symptoms that is beyond normal day-to-day variations and leads to a change in medication. Exacerbations of COPD can be precipitated by several factors. The most common causes appear to be viral upper respiratory tract infections and infection of the tracheobronchial tree. The diagnosis of an exacerbation relies exclusively on the clinical presentation of the patient complaining of an acute change of symptoms (baseline dyspnoea, cough, and/or sputum production) that is beyond normal day-to-day variation.

**CA22.1****Certain specified chronic obstructive pulmonary disease*****Coding Note:***

Use additional code to identify any associated respiratory tract infection.

***Exclusions:***

- Chronic obstructive pulmonary disease with acute exacerbation, unspecified (CA22.0)

**CA22.Z****Chronic obstructive pulmonary disease, unspecified****CA23****Asthma**

Asthma is a chronic inflammatory disorder of the airways in which many cells and cellular elements play a role. It is characterised by an increased responsiveness of the trachea and bronchi to various stimuli and manifested by a widespread narrowing of the airways that change in severity either spontaneously or as a result of therapy. This leads to recurrent episodes of wheezing, breathlessness, chest tightness, and coughing, particularly at night or in the early morning.

***Inclusions:***

- Idiosyncratic asthma

***Exclusions:***

- wood asthma (CA70)
- asthma with chronic obstructive pulmonary disease (CA22)
- miner's asthma (CA60.1)
- Wheezing (MD11.C)
- chronic obstructive asthma (CA22)
- chronic asthmatic (obstructive) bronchitis (CA22.1)

<b>CA23.0</b>	<b>Allergic asthma</b> Allergic asthma is the most easily recognised asthma phenotype, which often commences in childhood and is associated with a past and/or family history of allergic diseases such as eczema, allergic rhinitis, or food or drug allergy. Examination of the induced sputum of these patients before treatment often reveals eosinophilic airway inflammation. The main trigger is the exposure to inhaled allergens, such as dust mite and pollens, to which the affected individual has previously been sensitized. Patients with this asthma phenotype usually respond well to inhaled corticosteroid (ICS) treatment and specific allergen-immunotherapy.
<b>CA23.00</b>	Allergic asthma with exacerbation This refers to acute or subacute episodes of progressively worsening shortness of breath, cough, wheezing, and chest tightness, or some combination of these symptoms in patients with proven allergic asthma. Allergic asthma can be exacerbated by allergens to which the individual is allergic, other exogenous factors such as respiratory infections, pollutants or climate change, or endogenous co-factors. Exacerbations are characterised by decreases in expiratory airflow that can be documented and quantified by simple measurement of lung function (spirometry or PEF), can vary widely among individuals and within individuals from rare to frequent. The severity of exacerbation of allergic asthma can vary from mild to very severe and life-threatening, but in general respond to standard treatments of bronchodilators (inhalers) and steroid
<b>CA23.01</b>	Allergic asthma with status asthmaticus
<b>CA23.02</b>	Allergic asthma, uncomplicated
<b>CA23.1</b>	<b>Non-allergic asthma</b> Non-allergic asthma occurs in some patients who have asthma that is not associated with allergy. The cellular profile of the sputum of these patients may be neutrophilic, eosinophilic or contain only a few inflammatory cells (paucigranulocytic). Patients with non-allergic asthma often respond less well to inhaled corticosteroids. It can cover different phenotypes.
<b>CA23.10</b>	Non-allergic asthma with exacerbation
<b>CA23.11</b>	Non-allergic asthma with status asthmaticus
<b>CA23.12</b>	Non-allergic asthma, uncomplicated
<b>CA23.2</b>	<b>Other specified forms of asthma or bronchospasm</b> <b>Coded Elsewhere:</b> Asthmatic pulmonary eosinophilia (CB02.0) Samter syndrome (CA0A.0)
<b>CA23.20</b>	Aspirin-induced asthma In some asthma individuals, aspirin and other nonsteroidal anti-inflammatory drugs (NSAIDs) that inhibit cyclooxygenase 1 (COX-1) exacerbate the condition. This distinct clinical syndrome, called aspirin-induced asthma (AIA), is characterised by an eosinophilic rhinosinusitis, nasal polyposis, aspirin hypersensitivity, and asthma.

- CA23.21** Exercise-induced bronchospasm  
Exercise-induced bronchoconstriction (EIB) describes airway narrowing that occurs in association with exercise. EIB occurs in up to 90% of asthmatic patients and is estimated to occur in >10% of the general population. Recent reviews have identified asthma as a risk factor for sudden death and have reported many deaths that have been attributed directly to EIB.
- CA23.22** Cough variant asthma  
Cough variant asthma is an occult form of asthma in which the only sign or symptom is chronic cough.
- CA23.3** **Unspecified asthma**
- CA23.30** Unspecified asthma with exacerbation  
This refers to an unspecified inflammatory disease of the airways characterised by variable and recurring symptoms, reversible airflow obstruction, and bronchospasm, with an acute sudden worsening.
- CA23.31** Unspecified asthma with status asthmaticus  
This refers to an unspecified inflammatory disease of the airways characterised by variable and recurring symptoms, reversible airflow obstruction, and bronchospasm, with an acute exacerbation of asthma that does not respond to standard treatments of bronchodilators (inhalers) and steroids.  
**Exclusions:** acute asthma NOS (CA23.32)  
severe asthma NOS (CA23.32)
- CA23.32** Unspecified asthma, uncomplicated  
**Exclusions:** acute severe asthma (CA23.31)
- CA24** **Bronchiectasis**  
Bronchiectasis is an abnormal widening of one or more airways. Normally, tiny glands in the lining of the airways make a small amount of mucus. Mucus keeps the airways moist and traps any dust and dirt in the inhaled air. Because bronchiectasis creates an abnormal widening of the airways, extra mucus tends to form and pool in parts of the widened airways. Widened airways with extra mucus are prone to infection.  
**Exclusions:** tuberculous bronchiectasis, confirmed (1B10.0)  
Respiratory tuberculosis, not confirmed (1B10.1)

**CA25**

### **Cystic fibrosis**
